"To hold as 'twere the mirror up to nature."—*Shakespeare.*

NOTE.—All Communications for the Editorial Department are to be addressed to—

The Editors,

"Amateur Photographer,"

1, Creed Lane, Ludgate Hill,
London, E.C.

The Editors are "At Home" on Tuesday Afternoons from 2 o'clock till 5.

"HEARTY good wishes" to all for a prosperous and happy year. In looking back, those who endeavour to do their best are always conscious of not having succeeded. We are fully alive to the fact that during the year 1889 we did not do all that we intended to do. For our *laches* we crave the kind indulgence of our readers, and now offer them our assurance that no effort shall be lacking on our part to render a better account of ourselves for the year of grace 1890.

During the year 1889 we have treated many subjects editorially, and shall continue to do so. Not many new matters or processes have come to light during the past year. Hydroquinone has been much used, and almost every maker has adopted a formula especially suited to his own plates. There appears to be no doubt that for lantern slides hydroquinone is *facile princeps* the best developer, but many hold grave doubts as to its suitability for the development of a good printing negative.

Film photography advances, and the latest application of celluloid films is due to the enterprise of the Eastman Company; we of course refer to what has been termed their *rollable film*. The few results that we have seen are admirable. Some question the keeping qualities of the film, owing to its composition, but at present at least no evidence has been brought forward to support such fears.

Mr. Lyonel Clark, who is a very careful experimentalist, has succeeded in toning with platinum salts, ordinary albumenised paper, and almost any other vehicle. His results

have been much admired, and we have succeeded in inducing him to write a short brochure upon "Platinum Toning." This book is in the press, and will shortly be published at the popular price of one shilling. It will form No. 1 of the AMATEUR PHOTOGRAPHER'S Library. We have already announced the titles and contents of the first six volumes of the "Library" series. This series will make quite a new departure in photographic literature.

A subject which occupied the very earnest attention of many of our readers, and formed the text for several contributions to our correspondence columns early in the year, was the "Timing of Shutters." In this connection we may mention the very excellent articles by Mr. Jas. Stelfox, Mr. W. J. Wilson, describing his "Shutter Chronograph," and numerous correspondents. The series of competitive papers on "Shutters" also gave much useful information upon the subject.

The monthly competitive papers, for which prizes have been given, have resulted in the receipt and publication of many very valuable articles, and have dealt with Cameras; Lenses; Shutters; The sensitive medium, and its support; Exposure; Development; Intensification and reduction; Silver printing; Printing other than silver; Platinotype printing; Carbon printing; and Enlargements. We intend to widen the sphere of this work, and further reference is made in another column.

Another new departure that has given much satisfaction and great pleasure to hundreds of amateur workers throughout the kingdom has been the AMATEUR PHOTOGRAPHER Monthly Photographic Competitions. Every month a competition has been held and prizes awarded. After the prints have been exhibited they have been loaned to provincial and other photographic societies, and are now being lent for exhibition at drawing-room meetings, conversaziones, etc. We hope that during the year 1890 they may afford even more pleasure and instruction than those which have already been received and exhibited.

With regard to the growth of photography and its increasing popularity, we would call attention to the fact

For Contents, Prize Competitions, Notices, etc., see page 16.

that in the columns of the AMATEUR PHOTOGRAPHER more than twenty photographic societies have been started since January 1st, 1889. All of these have increased in "wisdom and stature," and are in much favour with photographers. Early in the year it was determined to link societies together, and for this purpose the PHOTOGRAPHIC SOCIETIES' REPORTER was established. The REPORTER has been a success from the start, and we note that between 500 and 600 reports of societies' meetings have been published. The papers read before the societies are many of them most valuable, and afford the most complete record of the advance of photography. In the first number the "Official Announcement" column contained particulars of officers and meetings from only forty-five societies; the issue for December 31st contains a list of more than 140 societies, and is the most complete extant. The fixtures for January are given in by far the majority of cases, and we trust that the officials of societies will see that by giving such particulars they are not only benefiting their own society, but all workers in photography. Each number has now a portrait of a President of one of the photographic societies. The first given was H.R.H. the Prince of Wales, the next Captain Abney, and afterwards they follow in the alphabetical order of the societies.

We have been very fortunate in the writers secured for the AMATEUR PHOTOGRAPHER, past and present. Our aim is to publish articles which are within the scope and understanding of our readers, and many have assured us that the selection meets with their entire approval. In the correspondence columns almost every subject connected with photography has been touched upon, and several wordy controversies have been carried on; notably, "Naturalistic Photography," and later the "Natural in Photography." "Amateurs' Negatives," and the establishment of a Photographic Institute have had much attention. In fact, no subject is too large or too small to be ventilated in the columns of the AMATEUR PHOTOGRAPHER, and our readers may at all times be certain of a fair hearing. The queries and answers given are of a much higher standard, and the "silly" ones that caused amusement to some of the more advanced workers are gradually disappearing.

The articles that have appeared from the pens of Robinson, Nott, Pringle, Burton, Bothamley, Leaper, Cobb, etc., are all of a useful and practical character. It will be noted further on that our efforts to supply good contributed articles will not be in any way relaxed during the year 1890.

With regard to the illustrations that have appeared, we can only say that we hope still to improve, and later in the year we shall adopt some system which will not only interest and instruct the worker in photography, but which will, we trust, be of interest to the general public.

The exhibition of photographs, whether in public or in private, increases in popularity. In order to induce amateur photographers to exhibit, we have placed the AMATEUR PHOTOGRAPHER medals at the disposal of a large number of exhibition Committees, and may mention the following:—Keighley, Oldham, Belfast, Fine Art Society, Richmond, Midland Counties, York, Glasgow and West of Scotland, Bradford, Derby, Cardiff, Lewes, Wolverhampton, Coventry, Tunbridge Wells, etc. We have found it desirable to make the conditions under which the AMATEUR PHOTOGRAPHER medals are given much more stringent, in

order that the best work, and the best work only, be exhibited. The wholesale awarding of medals, whether the pictures have merit or not, is greatly to be deprecated, and we hope judges will do their work in 1890 much more critically. Nothing is more annoying to really good workers than to find medals of equal value given for very indifferent work.

The Champion Exhibition which was held under the auspices of the Fine Art Society, could not be considered representative of the best work. The blame was more to be attached to the holding back of a certain section of prize winners, than to the promoters of the exhibition, who offered a liberal prize list. All during the year 1888 there was a perfect raving that artists should be included on the bench of judges. This has been done in 1889, to the disappointment of the many and the satisfaction of the few. In connection with our own competitions, we always endeavour to have a well-known artist as one of our judges, and have to express our thanks for services rendered, but it is our aim always to secure the services of gentlemen who themselves practice photography.

We would here add that a photograph cannot be judged on the same points as a painting, or engraving of a painting, and we do hope the time is not far distant when writers will give over calling an exhibition of photographs a "collection of choice steel engravings." We hold that there are possibilities in photography that can never be reached by painting or engraving.

A question of really universal importance, and one which was first brought forward in the AMATEUR PHOTOGRAPHER, is the adoption of the decimal system of weights and measures in photography. The Photographic Club have been at work in the same direction, and we were pleased to find that the fifth edition of "A Treatise on Photography" (Abney) gives all the formulæ in decimal notation.

The London Chamber of Commerce have formed a photographic section, and one of the matters they intend to deal with is the decimal system. Many very capable men have become members of the section, and there is every prospect of good work being done.

The Camera Club now numbers 560 members, and at their Conference many good papers were read. The chief features of the work done by the Club this year has been the holding of "one-man" exhibitions. Five have so far been arranged, namely, the works of Tolley, Sutcliffe, Gale, Robinson, and Rejlander. The Club quarters are still in Bedford Street, Strand, but the fact of the Club going into more commodious quarters is now definitely settled upon. We have, through the courtesy of the Committee, been permitted to send a representative to attend the "Thursday Evenings," and are therefore able to give a short summary of the proceedings. Many of the papers contributed by members are of importance to those who are unable to avail themselves of the benefits of membership. We are therefore exceedingly obliged to the Committee for the permission they have granted us, and take this opportunity of publicly recording our thanks.

The Photographic Convention must ultimately form a very valuable institution, and although we had occasion to question the action of the executive, we can assure them it was with the best intention of advancing the interests of photography. This year the meeting of the members

is to be held at Chester under the able presidency of Mr. C. H. Bothamley, F.I.C., F.C.S., etc. We shall look forward with much pleasure to the programme of proceedings.

Some of the contributions to the Physical Section of the British Association's meeting last year treated of photography, and were well handled by Captain Abney, who occupied the chair.

The literature of the year has not been added to very much. We might mention "The Dictionary of Photography" (Wall). This book has had a large sale, and the re-issue is being pushed on with. "Chemistry of Photography" (Medola) is a most useful work and well up to date. "Naturalistic Photography" (Emerson) has had, we believe, a large sale, although, as far as we know, few can uphold Dr. Emerson in his wholesale condemnation of the works of men who have been looked up to as authorities on art for generations. Had the book been written in temperate language, and the Doctor's views set forth clearly without maligning all and sundry who differ from him, we feel sure it would have been read more carefully and with more profit.

One of the events of the year has been the publication in Japan of a monthly photographic journal, the *Shashim Shimpō*. Professor Burton is on the editing staff, and we have reason to know that the matter contributed is of a very high order. The *Journal of the Photographic Society of India* has been enlarged, and will rank side by side with any journal issued by a photographic society. As we have said at other times, it is ably edited, and must be looked forward to by the members with much pleasure. The most direct advance in illustrated photographic literature is certainly the quarterly volume issued under the title of *Sun Artists*. The first number only has appeared, and it was devoted to the reproduction by photogravure of some of Mr. J. Gale's charming photographs. We reviewed *Sun Artists* at considerable length, and although there were doubtless faults, we can accord a very high meed of praise to the originators. The next number will be devoted to the works of Mr. H. P. Robinson, the letterpress being contributed by Mr. Andrew Pringle. Another departure in photographic literature has been our own child, the PHOTOGRAPHIC QUARTERLY. We are pleased to say that it has received very cordial support, and we shall aim at securing the best writers upon photography and kindred subjects. It is intended to produce a magazine that can be read by the general public as well as the photographer, and from the opinions of the Press that have reached us, we think that we may lay claim to have fairly succeeded. During the current year we hope to be able to illustrate each number by one or more processes, and shall be glad of any suggestions. In regard to other publications, we would note that a second edition of "Picture-making by Photography" (Robinson) has been issued, a new edition of "The Art of Retouching Photographic Negatives" (Johnson), and a most excellent work on "Collotype and Photo-Lithography," by Dr. Julius Schnauss, which was ably translated from the German by Mr. E. C. Middleton. This, we think, exhausts the important works on photography.

Several additions have been made to the list of photographic journals. Upon the retirement from the *Photographic News* of Mr. Thomas Bolas, he issued the *Photographic Review*. Mr. E. J. Wall has also started a monthly under the title of *Photographic Answers*. A rather

amusing leaflet is issued by the Britannia Works Company, called *Photographic Scraps*. It is carefully edited, we believe by their Mr. Howson, a gentleman possessing considerable literary ability. In January another monthly will be issued by Messrs. Percy Lund and Co., called the *Practical Photographer*. It will be seen that there is really quite a plethora of photographic literature. The journals that reach us from the Continent and the United States are very numerous.

From all the publications that come to hand something may be learnt, and with this issue we commence a new departure, and give a note or extract from "Our Contemporaries at Home and Abroad." This will be continued every week. We know that we can claim to be the first photographic journal that has given a review of its contemporaries, and we believe we can claim to be the first class journal that has done it. Of course our notes will only have reference to the original articles and editorial opinions, and as such will necessarily be brief, but it may be taken that we shall be careful to quote that which will interest and be of service to our readers.

Our efforts to be useful to workers in photography will not be relaxed. With regard to "dark-rooms" we may mention that we commenced last season with a list of 141, and closed with 213. We shall this year start the work earlier, and before the holiday season commences hope to have at least 500. We may mention that during last season we had as many as forty applications for introductions on one morning. We believe that many of the more important photographic societies in seaside towns and tourist resorts will permit temporary membership at a small subscription; this is, we know, now permitted at Bath and Southsea.

Societies are setting themselves to work to do practical photography, and we feel sure that our exertions in urging them on will show more fruit next season than it does at present, although we are by no means dissatisfied with the work taken in hand. Photographic surveys are now in course of being carried out by Liverpool, Birmingham, Gloucester, Sheffield, Manchester, etc., etc. All this work will help to establish a photographic record of what has been, is, and is to be in this country.

We have almost exhausted the past, and should like to draw the attention of our readers to the future of this Journal. We have arranged with Major Nott to contribute a series of practical articles under the heading of "Photographic References." He has himself set forth in the introductory article the ground he means to cover, and we are perfectly certain that he will supply us with matter that shall teach the worker in photography, whether a beginner or a veteran. Mr. H. P. Robinson has again been good enough to undertake to write for us, and we think that he has struck out quite a new line in "The Complete Photographer; or, the Modern Recreation of Contemplative Men." Our readers will shortly be able to judge, as the first chapter will be published next week:

During the past year the "Competitive Papers" have formed a feature of this journal, but we have felt that the conditions under which they have been contributed prevented many from entering. We have therefore determined to leave the selection of subject open to competitors, with, of course, the proviso that the contribution must have reference to the practice or art of photography. They may

contribute under three general headings—Apparatus, Art, Chemistry. The contribution must not exceed 1,500 words, or be less than 750. Illustrations may accompany the articles, but they *must* be drawn on separate sheets of paper, and in such a manner as to be easily reproduced. Three prizes will be given for the best three papers contributed under each heading every month, *i.e.*, three prizes each of one guinea, half a guinea, and a certificate. Full particulars will be announced later on. We are sure that many will be pleased to give their experiences. Those contributions which have merit, but which are not up to prize form, will be retained, and from them a selection will be made for publication, with the prize contributions, in the

AMATEUR PHOTOGRAPHER'S ANNUAL,

which will be issued in the late autumn of this year. No regular contributors to photographic journals will be allowed to enter for the "Competitive Papers," as they will still be called. It is our intention to have all the leading processes, etc., written up by specialists for the ANNUAL. In the "Competitive Papers" we seek to gather together the contributors' experiences under the three general headings of Apparatus, Art, and Chemistry.

Many will have noticed that we intend to have set photographic competitions during the year, and only to deal with four classes of work. Entry forms will be prepared, and, as soon as ready, will be advertised.

TRAVELLING STUDENTSHIP.

The conditions of a competition open to all are not quite ready for publication, but we may add, in regard to the prizes, that we have decided to offer the following:—

First Prize	...	...	£30	0	0
Second "	...	...	21	0	0
Third "	...	...	14	0	0

These amounts are practically to cover the cost of a holiday, in the first case extending over one month, the second three weeks, and the third two weeks. We shall require each prize winner to allow us the use of at least twelve negatives taken during his holiday, with full power to publish the photographs in any form we may desire. We shall also suggest tours to the winners. The particulars of the competition for which the prizes will be awarded will be made public as soon as possible. We may add that prints will have to be in our hands not later than the middle of June, in order that the adjudication may be made and the prizes awarded in ample time to fit in with the ordinary holiday recesses.

Three minor prizes will be given, making six in all. We hope prize winners will go in for this competition, which we shall term the "AMATEUR PHOTOGRAPHER Travelling Studentship." The number of prints to be sent in by each competitor will be limited to six, neither more or less.

With regard to the future illustrating of the AMATEUR PHOTOGRAPHER, we shall be glad to receive suggestions. We should add that with so large a circulation as this journal now has, the illustrations are attended by very considerable expense, and it is difficult for us to recoup the large outlay, the only satisfaction being that we please our readers. In order, therefore, to meet their wishes, we would ask for suggestions, and will give them all our very careful consideration.

In looking over these few notes, we feel that many items that should have been mentioned have been omitted,

but we are dealing with an indulgent public who will, we feel sure, look over our many shortcomings. We can assure them it is our earnest wish to help, encourage, and, if possible, teach all workers. In writing, we always feel that there is a bond of union existing between us and ours, and the more we see and hear of each other the more we are sure will the interests of photography prosper. May we therefore be permitted to close this New Year's chat with the following lines, which many of our readers will doubtless remember:—

"Ointment and perfume rejoice the heart of man,
So doth the sweetness of a man's friend by hearty counsel."

* * * *

FROM a letter that has just reached us, we note that it is proposed to form an Amateur Photographic Society at Tottenham. A meeting will be held at 1A, Lansdowne Road, Tottenham, to-day (Friday). Several prominent amateur photographers have signified their intention of being present.

* * * *

THE annual *soiree* of the members of the Oldham Photographic Society will be held on Thursday, the 9th instant.

* * * *

WE have received a communication from Mr. Eden E. Greville, advising us that a photographic society has just been formed at Maidenhead. Mr. Greville has been appointed Hon. Secretary, and will be glad to hear from any gentlemen who may wish to become members.

* * * *

WITH regard to our comments made last week upon the withholding of the AMATEUR PHOTOGRAPHER medal, we may now state that the competition in which the medal was to be awarded as a prize was arranged by the members of the Sunderland Photographic Society. The judge whose conduct we upheld was Dr. Haswell. We were in error in stating that he was an officer of the Society. He is not connected with the Society, even by membership. Dr. Haswell writes us "That there is some amount of dissatisfaction occasioned by his having withheld the medal after the recent competition in Sunderland, and he fears that the editorial in the AMATEUR PHOTOGRAPHER of the 27th ult. will scarcely be enough to clear him of blame in the matter." He says: "There is abroad an impression here that the AMATEUR PHOTOGRAPHER medal was offered simply for the best picture, 'without any reference being made to technique and finish, or to the general value of the exhibitor's work.'"

We have not seen the photographs sent into the competition, but understand that the picture which Dr. Haswell judged to be the best artistically was a drop-shutter view, and that the technique of the competitor's work generally was faulty, and that therefore he did not feel justified in awarding the medal. He appealed to us, and we upheld his decision. A competitor's work must *all* be technically good to entitle him to a prize. In order to encourage the members of the Sunderland society to persevere and contribute good work, we at once offered our Silver and Bronze medals for future competition. It might perhaps be well that the whole of the competitors' work be sent to us for opinion.

A CORRESPONDENT asking our help in getting up *Lancaster Evenings* for Lancashire operatives, thus writes—"A few years ago when, through ill-health, I was dragged down to the very depths of melancholy, a kind friend sent me a copy of the *AMATEUR PHOTOGRAPHER* with an article marked, so that I should notice it. That article was the means of my taking up photography. I shall never regret it; it has caused me to spend a great deal of my spare time pleasantly, which would otherwise have been dull, nay, miserable. Besides, photography has enabled me to obtain lasting memories of dear ones departed. It is with great pride that I gaze on these faces, and I thank the day when I came across your valuable journal. It is with these feelings that I have resolved to start the New Year in trying to help others to forget their troubles; even if it is only an hour or two's entertainment, it will be very acceptable to those who pass their lives in semi-slavery."

* * * *

UPON SOME METHODS OF FINISHING PHOTOGRAPHS.

MOST amateurs who talk glibly of particular methods of development, and expatiate upon the beauties of a perfect negative, are content to stop at this point, and pay little or no attention to the equally important work comprised in the production and finishing of a photographic print. Last week we said something for the benefit of those who delight in seeing their photographs finished with a highly-glazed surface, and although we deprecated their taste, we were bound to admit that the said glaze gives a depth to the shadows which is not often seen in a matt-surface paper. We remember that among some of the last exhibited works by the late lamented Mr. Donkin were some small ones on Aristotype paper. These, we need hardly say, bore the highly-polished appearance common to pictures printed by that method; but at the same time their artistic value did not suffer. Of course, they were views of Alpine peaks, and the delicate shadows in the snow were rendered with marvellous effect. The pictures were small—about 5 by 4, if we remember rightly—and the entire absence of grain which the glazed surface ensured made them equal in beauty to delicate transparencies on glass.

But this is by no means the only manner of obtaining a shiny surface upon a photograph without the use of a burnishing machine. We may get a very good effect by squeegeeing a damp albumenised print to the surface of glass, ebonite, enamelled slate, and other substances, taking the precaution, by the use of French chalk (talc), to prevent the adhesion being of too permanent a character. It is true that most of the glaze so obtained will disappear during the after-process of mounting on card, but this can be avoided if we merely fix the print by its edges to its final support, a precaution which, of itself, leads to permanence.

A method of conferring depth upon the shadows of a photograph by mounting the print in optical contact with glass came into fashion a few years ago, and we remember that certain prints so treated were medalled. We may suppose from this that the artistic qualities of the pictures in question did not very greatly suffer from the manner in which they were mounted. To secure the best effect,

the picture should be printed to a much deeper tint than if it were to be mounted on card, for the optical-contact method makes the paper more or less translucent, and thus robs the picture of some of its force. The method in more common use at this time was to float the paper in a warm solution of gelatine, and to squeegee it upon the surface of a sheet of good glass. A better plan, we think, was to use a solution of starch, which is not so liable to change colour as gelatine. The plan, although it cannot be recommended from an artistic standpoint, has the undoubted merit of permanence. Nearly every case of fading in an albumenised print may be traced to the mountant, or to the card employed as the final resting place of the print. Starch is, perhaps, the most innocent mounting material which can be used, and when it is in contact with glass, and the silver print sealed between the two, it is next to impossible for any deleterious action to be set up. Still, we must remember that glass itself is apt to yellow very quickly with age, and this change would, of course, damage the appearance of the print behind it.

Two examples of this tendency of glass to become yellow recently came under our personal observation. The first was in the case of some embossed globes on a gaselier, one of which had by accident become broken. A new one had to be made, for the pattern had gone out of date. When this new one was placed in position the contrast between it and its carefully-cleaned fellows was remarkable. It was perfectly white, while the other two were quite yellow by comparison. The other example was in glass of better quality, namely, that of the dioptric apparatus in the South Foreland lighthouse. Although the compound lens here employed is kept carefully shielded from daylight by blinds hung round the lantern room, we noticed upon our last visit there that the glass of which it is composed was pale yellow. There is little doubt that originally the very best white glass was employed in the construction of this expensive lens, and we may attribute the change to the action of the powerful electric light, which for the past twenty years has been nightly employed here.

Another method of treating a photographic print, and one which we believe tends to protection of the picture from atmospheric and other deleterious influences, is the use of encaustic paste. Recipes for compounding this are easily found in most books of reference—notably the photographic annuals—and the operation is not unlike that of polishing furniture. That is to say, a little of the waxen compound is rubbed upon the surface of the print, and then lightly polished off with a piece of clean flannel.

One more method we may mention, and one which is not generally practiced or even known. An albumenised picture can, after mounting, be actually French-polished. The method only differs from the manner of French-polishing wood, in that the paper possesses no open grain which has first to be filled in with some foreign body, and further, the operation, instead of being a slow one, can be completed in a very few minutes. The best white polish should be used, and is applied sparingly to a ball of flannel about the size of a large walnut. Over this is stretched a covering of old linen, the outer side of which is lightly smeared with a drop of linseed oil. The surface of the picture is now lightly rubbed with this pad in a circular direction, and presently it will assume a brilliant appearance. We do not advocate this as an artistic treatment, but it will certainly act as a protection to the picture.

Letters to the Editors.

PHOTOGRAPHING AT BOULOGNE.

SIRS,—I have just returned from Boulogne-sur-Mer, and I think it may interest some of your readers to hear a little of its photographic capabilities.

I was there for three weeks, but a week would, if the weather was favourable, be quite enough to exhaust its subjects.

The first day (say Monday) one might confine oneself to the old town and ramparts. The three Portes (Porte des Dunes, Porte de Calais, and Porte Gayole) are well worth taking, and there is a nice view from the top of the ramparts looking towards Notre Dame.

The next day one could take the old clock tower from off the ramparts, from over the Porte des Dunes; and the Rue de Calais makes a nice photograph from the Porte de Calais.

Wednesday, one might take La Colonne, which is about one mile from the town. The docks afford endless views of shipping, and the fishwives themselves are worth taking.

Of course, there are many more things to photograph besides those I have mentioned; but I fancy I have said enough to show that a week's holiday may be very pleasantly spent at Boulogne. I stayed at the Hotel du Nord, and was extremely comfortable.

Apologising for the length of my letter, I remain, yours truly,
December 26th, 1889. GERALD STRICKLAND.

* * * *

PYRO POTASH DEVELOPER.

SIRS,—For the assistance the AMATEUR PHOTOGRAPHER has been and is to me, allow me to thank you, and to say that without it I had no means of finding my way out of the many quagmires an amateur photographer may get into.

Whilst writing, I should further like to say that I think it such a pity our big guns do not advocate the use of the pyro-potash developer in place of the ammonia, as the potash is so much safer in the hands of a novice. With Eder's pyro-potash developer and a bottle of bromide, I find almost any exposure can be given, especially if the operator is not chary of his time in bringing out the picture. I was very much struck with the remarks of the Rev. W. Aston in the PHOTOGRAPHIC QUARTERLY, and his comparison of the three developing factors, or rather the accelerating agents.

HYDROQUINONE.

The formula of one solution given by a correspondent from Rio Janeiro, I find works very well, and is completely under control. If anything, it is a trifle long in getting out the picture.

CHEAP PLATES.

Perhaps some of your correspondents can give me some reason why plate manufacturers should so much vary in price. Some half-plates I have been using for some time cost me 13s. per gross, whilst I cannot get the generality of other makes for less than 2s. 3d. per dozen, and yet I can get quite as good results with the cheaper plate, and even if a plate is lost now and again the cost is not much of a consideration.

Trusting these few remarks may be useful to others who may be like myself, I remain, yours truly,

A COUNTRY COUSIN.

* * * *

WILSON'S CHRONOGRAPH.

SIRS,—In your issue of Dec. 20th, I observe an account of a meeting of the Camera Club, in which your reporter relates, evidently with great gusto, the way in which Mr. Sturmev was "sat upon" by Mr. Lionel Clark for presuming to think that he had been able to measure the speed of shutters with anything like accuracy by means of Wilson's chronograph.

I am not concerned for Mr. Sturmev, who is, no doubt, able to defend himself; but I cannot help thinking that it would have been better if Mr. Clark had taken the trouble to understand the instrument before so triumphantly condemning it; and perhaps your reporter would not have been quite so jubilant had he also known more about the question.

As a matter of fact, neither the variability or uncertainty of the light, nor the sensitiveness of the plates used, makes the slightest difference, provided only that the light be powerful enough to produce an impression on the plate in the smallest

time it is desired to note. A very small quantity of magnesium mixture (*not* "flash" light) is sufficient to ensure this minimum of light, and beyond it no excess or variation (short, of course, of reversal of image) can interfere in the smallest degree with accuracy of result. So much for "the knife"!

As regards the motor employed, everything *does* depend upon that, and just in proportion to the regularity and correct time reading of the motor is the exactitude of the determination.

I should not use a gas engine if a Foucault's clockwork motor, a water motor, or a *suitable* steam-engine were available, but I have yet to learn that "if there is one thing on the face of the earth irregular and uncertain, it is an Otto gas engine." On the contrary, I have never yet met any engineer who did not consider the Otto as the most perfect member of the tribe, and some ten years' experience with several gas engines confirms me in that opinion.

I don't say it is equal in regularity to a good steam engine, but the fact that it is desirable to add to the weight of the fly-wheel when used for electric light proves nothing. I have before me a catalogue of one of the first makers of steam-engines in the kingdom, and to every engine is attached the note, "For electric lighting the fly-wheel can be enlarged at an extra charge."

The regularity, or otherwise, of the Otto has nothing to do with the correctness of the principle of Wilson's chronograph, but if it be borne in mind that only a few minutes are required for any one experiment, and that the rate of motion can be and should be counted immediately before and after each determination, it is difficult to see where any appreciable error can come in: it is possible that even "dulcet tones" may be liable to a greater amount of inaccuracy.—I am, sirs, faithfully yours,

Dec. 23rd, 1889.

WILLIAM J. WILSON.

* * * *

HINTS ON ARISTOTYPE PRINTING.

SIRS,—Some of your readers who employ Aristotype may be continually disappointed at finding that beautiful purple tones produced by certain baths, are replaced during fixing by an unpleasant reddish colour.

I think that if they try the following plan, they will usually obtain good black or very respectable dark brown tones, even if purple colours are lost.

After toning to purple colour, keep the prints for say five or ten minutes in a weak solution of hypo, plus a sufficient amount of gold. Afterwards keep them for the ordinary time in a solution of unmixd hypo of the ordinary strength.—Yours, etc.,

December 26th, 1889.

G. M. S.

* * * *

PHOTOGRAPHERS' BENEVOLENT ASSOCIATION.

SIRS,—The Photographers' Benevolent Association is now so well and favourably known to most of your readers, that I feel emboldened to ask space for this short communication.

The Association has, after a long struggle with the apathy of those whom it wished to benefit, at last become the recognised charitable centre of the profession. Its objects are already widely known, and during the sixteen years of its existence there has not been a single charge against the Committee of unfairness or injustice in their awards. This, the Committee freely acknowledge, is in a great measure due to the careful investigation which each case has received at the hands of the Secretary, Mr. H. Harland. Owing to the pressure of other business, this gentleman is compelled to resign his position in February next, and the Committee have, in consequence, to seek for a successor to him. This affords a favourable opportunity to replace a paid secretary by an honorary one, provided that a gentleman, either amateur or professional, can be found able and willing to devote a small portion of his time to the duties. It has been several times pointed out that the Secretary's salary, small though it is, forms a serious item in the yearly balance-sheet, and it is with the hope of being able to still further benefit their poorer brethren, that the Committee now appeal to the photographic community for a volunteer in this capacity. It may be mentioned that the duties are simple, and can easily be performed by any one who has had any business experience.

The Chairman of Committee, Mr. W. Bedford, 326, Camden Road, N., will be pleased to furnish further particulars, list of Committee, etc.—I am, sir, yours faithfully,

(Pro Committee, P.B.A.),

December 30th, 1889.

E. CLIFTON.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

GENERAL MANIPULATIONS.

(Continued from page 413, vol. v.)

FILTRATION is sometimes a very tedious operation, especially if the substances to be filtered are gelatinous in character, and it is therefore desirable to accelerate the process. This is done by reducing the pressure below the filter, when the pressure of the atmosphere, acting upon the surface of the liquid in the filter, drives it more quickly through the pores of the filtering material. In many cases the simple plan shown in fig. 2 answers quite well. A glass tube of the same diameter as the stem of the funnel is bent in a loop in the manner shown, and is attached to the stem of the funnel by means of an india-rubber tube. If the filter-paper is made to fit the funnel properly, the long tube below the bend becomes filled with liquid, and the weight of this column of filtrate pulls the liquid through the filter. It should be observed that the efficiency of the apparatus depends on the length of the tube below the bend; the distance between the funnel and the bend may be as short as convenient. The tube should not be so wide that bubbles of air can pass up from the bottom.

FIG. 2.

When greater assistance is required, one of the so-called "water pumps" must be used, but the arrangement of apparatus necessary in this case will be described later on.

Working Glass.—It is necessary to acquire at once the art of cutting glass tubes and rods, bending them to any required shape, and drawing them out into jets and points; but other operations, such as blowing bulbs, joining wide tubes to narrow tubes, and making three-way tubes, though often of the greatest service, are not indispensable.

Narrow tubes and rods are cut with the aid of a triangular file. Do not saw the file backwards and forwards, but with steady pressure and one firm stroke make a sharp cut at the point where the tube is to be severed; now hold the tube with one hand on each side of the cut, and, with the thumbs pressing on the tube close to the cut, snap the tube across. As a rule it will break with perfectly clean edges, but if the tube is somewhat wide, it is advisable to protect the hands against possible injury by means of a cloth. Wide tubes do not break easily in this way, and must be treated differently. Make a fairly deep cut in the manner just described, and then carefully carry the cut round the tube, leaving it deepest, however, at the point where it began. Now heat a very narrow piece of rod or tube in the flame of a Bunsen burner until the end of it is at a bright red heat, and press the red-hot glass on the cut at its deepest part. If the glass is of good quality and the cut has been properly made, the tube will divide with clean edges.

Bending tubes requires only a steady hand, care and patience, and a little practice. Success depends in the first place on having a sufficient length of the tube uniformly softened, this length being greater, the greater the diameter of the tube. Above all, avoid hurry. Any attempt to bend the tube before it is properly softened is fatal. *Good bends cannot be made in a Bunsen flame*, because the flame is too narrow to heat a sufficient length of tube.

Moreover, it is hollow, with the exception of the upper part, and hence the tube becomes heated only at the two points where it cuts the edges of the flame, and the result is not a bend but a kink, as shown in A, fig. 3. A luminous gas burner of the ordinary tulip pattern should be used. They can be obtained mounted on stands somewhat like a Bunsen burner, but if the ordinary gas bracket is not too high, it does almost as well. Tubes a quarter of an inch in external diameter will require a No. 4 or No. 5 burner at its full height; for narrow tubes the flame should be lowered according to their diameter. The lower dark part of the flame is hollow, and the tube must be held in the luminous part of the flame (fig 4.) The position of the bend being decided

FIG. 3.

on, the tube is supported between the thumbs and fore-fingers at points equi-distant from the bend and the ends of the tube. The hands are underneath the tube, and the latter rests on the edges of the tips of the middle fingers, and is gripped by the tips of the thumbs and fore-fingers. Glass flies to pieces if too rapidly heated or cooled, and in order to heat the tube gradually it is at first moved in and out of the flame, the duration of its stay in the flame being slightly increased each time until it is kept in the flame. In order to heat the tube uniformly, it is slowly rotated by means of the thumbs and fore-fingers, it resting all the time on the tips of the middle fingers. Great care must be taken to rotate both ends of the tube at the same rate, otherwise it will

FIG. 4.

twist as soon as it becomes soft. As the tube gets soft, great care and steady hands are needed to keep it in its original position and rotate it properly; any pulling or twisting will spoil it. When the part of the tube in the flame is thoroughly softened, *but not before*, stop rotating the tube, take it out of the flame, and *slowly* bend it to the required angle. If the operation is successful, you will have a circular bend like B, fig. 3. If the tube is bent before it is soft, the bend will be flattened and the tube constricted—(C, fig. 3)—and the same result may be produced if the tube is unevenly heated or if it is bent too quickly. Hold the tube carefully in the hands until it becomes hard again, and then put it down in such a way that it is supported at the ends and the hot part does not come into contact with

anything. When cold, remove the soot from the bend with a duster or a piece of soft paper.

The ends of glass tubes have always sharp edges, which are not only dangerous to the hands and fingers, but also prevent the passage of the tube through a hole in a cork, etc. To remove this difficulty the ends of the tube are gradually heated in the upper part of a Bunsen flame until the edges just become red-hot. When the tube is cold again it will be found that the edges have fused and are now nicely rounded. If the tube is heated in the flame too long, the edges fall together and close it up.

Drawing tubes out is an operation required for the production of capillary tubes or of jets. Narrow tubes can be

worked in a Bunsen flame; large tubes require a blow-pipe flame. The tube is carefully introduced into the upper part of the flame (fig. 5) and rotated, and when the part in the flame becomes soft, the ends of the tube are *very slightly and very gently* pushed towards each other, the heating being continued. Under these conditions the tube "thickens up" (fig. 6, A), and if when it is quite soft it is removed from the flame and slowly pulled, it becomes narrowed in the manner shown in fig. 6, B, and by cutting with a file at any desired point, a jet is obtained with a diameter depending on the original diameter of the tube and the way in which it has been pulled. By working in this manner the glass is as thick at the end of the jet as at any other part of the tube, whereas if it were pulled as soon as it was soft, without

Fig. 5.

a preliminary thickening up, the glass at the tip would be very thin and liable to fracture (fig. 6, C).

Capillary tubes are made in the same way, except that the tube is pulled out more quickly (though still slowly) to a length of two, three, or four feet, as the case may require (fig. 6, D.)

Fig. 6.

Glass rods are indispensable for stirring liquids, transferring liquids from one vessel to another, etc. They are made by cutting glass rod of about an eighth of an inch in diameter into suitable lengths by means of a file, and then rounding the edges by holding the ends in the Bunsen flame until they just melt. It is not advisable to flatten the ends into knobs, nor to draw them out into points.

Boring holes through corks, in order to pass tubes through them, is done either with round (so-called "rat-tail") files or with cork borers. India-rubber corks can only be perforated by cork borers. The latter are brass tubes of different diameters with the lower ends sharpened, whilst in the upper part is a hole through which passes a cross-piece of stout wire, which forms a kind of handle and also serves to push the pieces of cork out of the borer. The borer is drilled through the cork with a rotatory motion; it

cannot be pushed through. Care and some practice are needed to make the hole go straight through the cork, and when two or three holes have to be made through the same cork, the difficulty is, of course, increased, for all the holes must be parallel. It is often a good plan to drill the hole half way from one end, and then withdraw the borer and start from the corresponding point at the other end, and drill in the other direction until the hole is complete. Ordinary wooden corks are bored with a dry borer, but for india-rubber corks the borer must be kept moistened with alcohol or turpentine.

A round file may be used for wooden corks, though not with india-rubber. They have somewhat fine points with which the hole can be started, and it is finished by combined drilling and pushing. Take care to keep the file straight, or the fine point will snap off.

After wooden corks have been bored with a file or borer, the hole may be enlarged by working the file backwards and forwards, turning both it and the cork round in opposite directions in order to keep the hole cylindrical. It is very easy to put the hole out of shape unless attention is paid to this point. India-rubber corks cannot be treated in this way; the hole must be made of the right size at first.

Fitting corks to flasks and other apparatus requires careful attention, for if there is any leak there will be a waste of gaseous products, and the experiment may fail. India-rubber corks are usually quite round, and give little trouble, but wooden corks are frequently irregular in shape, and do not fit tightly into a round aperture. So-called "best selected" corks should be used, and should be free from channels and cavities. Select a cork which is somewhat too large for the particular flask or tube, wrap it in soft paper, and soften it by rolling it under the foot. This is much better than using a cork squeezer. The cork will soon be almost perfectly round and very much softer, and will probably fit the aperture perfectly. As soon as the required holes have been bored in it the cork should be fitted into the aperture, and not taken out for some time, otherwise it may return to its original shape and size, and it cannot safely be softened again after it has been bored.

(To be continued.)

MESSRS. VALENTINE AND SONS, of Dundee, have secured a piece of ground at Downfield for the erection of photographic printing works. The new works will afford employment for a large number of young women, and are chiefly intended to meet the demands of Messrs. Valentine's foreign business.

THE AMERICAN ANNUAL OF PHOTOGRAPHY for 1890 is a splendid specimen of an annual, clearly printed, well illustrated, and containing much valuable information. All the illustrations are reproductions of photographs, the most striking being a portrait of Mr. Edison, in half-tone; "A Merry Tale," in the Lichtdruck process; "Southern Fruit," a most successful half-tone engraving of an orthochromatic study; "Minnehaha Falls in Winter," by the Levytype process; "In Central Park," a clever reproduction in line and stipple of a photograph of the elephants in the Central Park, New York; "Babyhood," a pretty little photogravure; and "Off Duty," a successful instantaneous picture of a Great Dane jumping off the ground in an erect position. Perhaps the most curious of the photographs is one of bats hanging on the walls of Howe's Cave, Schobani County, N.Y., taken by the flash light with perfect success. Amongst the numerous articles, we notice one on "The Platinum Toning of Aristotype Prints," by Mr. A. Stieglitz; "A Reminiscence of Development," by Mr. Pringle; Mr. Traill Taylor on "The Unrecognised Possibilities of Celluloid Films;" Dr. John Nicol on "Eikonogen;" Mr. A. R. Dresser on "Hints to Beginners;" Mr. Jerome Harrison on "How to See Photographically;" Mr. F. E. Ives on "Orthochromatic Photography;" and Mr. Nureller on "Copying Old Prints." The review of the year is concise but effective, and the book generally is deserving of all praise.

Winter Work.—XIII.

By T. C. HEPWORTH, F.C.S.

WATER LENSES AND SCREENS.

(Continued from page 432, vol. x.)

ALTHOUGH I am not in a position to say whether or not water lenses have been employed for photographic purposes, it is certain that they have been used in other branches of science. In the year 1872 Dr. R. M. Fergusson brought before one of the Scottish scientific societies a simple apparatus which he had designed for exhibiting wave motion, the principal part of which comprised a hollow lens filled with liquid. This apparatus was described and figured in the *Quarterly Journal of Science* for April of the same year, and I have thought it worth while to reproduce the drawing, so that those interested in the matter may be able to see what has already been done (fig. 1). It will be noticed that Dr. Fergusson's apparatus is supported by an ordinary chemical retort-stand, a contrivance which ought to be possessed by every photographer, so useful is it in all sorts of operations that come within his ken. In the present case the stand is furnished with five attachments, which are clamped to the main stem in the usual way, and which it will be convenient to letter from the bottom upwards, A, B, C, D, and E. A is a mirror which turns the luminous ray from the light source—in this case a lime jet—from the horizontal to the vertical position, so that it may traverse and be condensed by the liquid lens B. This lens, we learn, was made by cutting the top from a well-formed glass shade, and measured eight inches in diameter. Its actual diameter liquid, which was found to be six inches. I fancy that glasses like enlarged watch glasses, and which are made to cover clock faces, would be the better article to get for this purpose. In the case before us the containing vessel is actually deeper than would be required for most purposes,

FIG. 1.

for here the liquid had to be disturbed in order to induce wave motion. This was brought about by means of the bent thistle-headed tube C, which, by means of a tap and finely pointed exit tube, could be made to emit drops slowly or quickly. The liquid employed was spirit, on account of its

greater limpidity, but water would be used for ordinary optical work. Next above this liquid lens is an ordinary lantern objective or photographic lens, and above this again we have another sloping mirror to once more turn the vertical ray to the horizontal direction, so that the image formed by the objective lens may be projected upon a screen.

A still more simple arrangement, under the title of "water lantern," is described in Mayer's little book on the phenomena of sound. Of this I give a sectional drawing in fig. 2, from

FIG. 2.

which it will be seen that the apparatus takes the form of a box on end, but open at one side for the introduction of the light rays, from whatever source they may be obtained. These rays are received by the sloping mirror M', and are reflected by it towards the condensing water lens P. Upon the surface of the water may be laid a plate of thin glass, which will serve both as a defence against dust, and also as a convenient transparent table upon which slides and other objects for projection can be laid. Above this there is a smaller water lens to act as an objective, which is held in a moveable shelf, the height of which can be carefully adjusted by the screw nut S. To crown all, there is a second mirror M, swung like a toilet glass between two uprights, whose duty it is to bring the light rays once more to the horizontal position for projection upon a screen.

It is evident that in both these devices much light must be lost by reflection. This might be obviated in fig. 2 by dispensing with the lower mirror, and putting in its place a lime-jet in such a position that the luminous side of the lime would be presented towards the lens. There would be no great difficulty in this, for a lime-jet will burn well in any position in which it may be held. The heat from it rising upwards, would tend to cover the lens with moisture, but this could be obviated in the description of lens under consideration by filling it with warm water instead of with cold.

The glass cover to the lens at once suggests the construction of one which shall remain permanently closed, and which shall be available in the horizontal or vertical position. The construction of a compound condenser, consisting of two plano-convex lenses of large size, should not present any insuperable difficulties. In constructing one element of such a condenser the first thing would be to obtain a concave glass, and a flat glass of exactly the same size. These should be ground with emery and water for half an inch on both sides round their edges. The next thing

would be to procure a metal annular frame of this section 1, and to carefully putty them in with a mixture of white and red lead in oil, leaving a small hole in one of the glasses, at the extreme edge, through which the lens could be filled with water after the cement had hardened. It must be remembered that unless such a lens were quite full of liquid it could not be used in the horizontal position, for any air bubble that remained would naturally find its way to the highest point, and would make its presence evident upon the screen. A word as to the best form of screen to employ in this work of projection will not be out of place.

In cases where the lantern is being constantly used, whether for trying slides in the amateur's workroom or for demonstration in lecture theatres and schools, it is of importance that a suitable screen or sheet should be available at a moment's notice. This should be made of opaque material, for it must be remembered that all light which filters through such a screen is lost, and the pictures suffer proportionately. A whitewashed wall makes the finest lantern screen—and this is provided in some few lecture theatres—the unsightly patch of whiteness being hidden, when not in use, by curtains. But a portable screen which is quite as effective has recently been put on the market by Messrs. Mason and Payne, the map publishers, of Cornhill. This is made of strong cloth, faced on each side with paper, so that it may be quite opaque to the rays from the lantern. The cloth is stretched, shrunk, and mounted with its paper facing, by experienced hands, so that the surface is as flat as a whitewashed wall, and far whiter, for the pigment which is subsequently applied to its front surface so as to give it a finish, is the finest oxide of zinc, a material which does not, like flake-white, darken with time. These screens are fitted with roller and lath, so that when not in use they are rolled up out of sight like a window blind. They are made in all sizes, the largest ever made being perhaps that which was used for my photographic lectures in the theatre at the Crystal Palace. This measured thirty feet square, and contained, therefore, 100 square yards of material. About forty pounds of zinc oxide was used to give it its snowy coat of white, and the pictures projected upon it were consequently of extreme brightness.

(To be continued.)

KIDDERMINSTER PHOTOGRAPHIC EXHIBITION.—The Secretary writes that the entrance fee for each class is two shillings, which covers any number of frames, and that the time for application for space is extended to February 1st.

THE "NORSE" VIGNETTER (Marion and Co.) is an ingenious little arrangement for securing openings of various shapes and sizes in a few seconds, and as there is an arrangement by which the mask can be placed closer or further away from the negative, the vignetter promises to be most useful and economic.

IN PARIS they are somewhat ahead of us in the matter of comfort in portraiture, for there a note brings the photographer to your own house. Photographs taken this way are more interesting to the recipients, and the posing, in freedom from the head-rest, is simply concentrated comfort as compared to the old style. English photographers are, however, coming round, and a number of them announce that they will photograph their customers at their own homes. May their number increase.

BRIXTON AND CLAPHAM CAMERA CLUB.—The members of this Club are going to hold an exhibition of members' work on the 20th and 21st instant, and they offer a silver and five bronze medals themselves, and also an AMATEUR PHOTOGRAPHER bronze medal. There are to be six classes: Landscape and marine; architecture, including interiors; instantaneous work (moving objects); portraiture; enlargements; lantern slides and transparencies. All entries must be made by the 3rd instant. We hear that Mr. A. R. Dresser has accepted the Presidency of the Club.

Hambling Papers.—VII.

By W. K. BURTON.

LENSES FOR INSTANTANEOUS AND DETECTIVE WORK.

(Continued from page 415, vol. x.)

THE greatest difficulty that I have found, in a very moderate experience of the photographing of ships in motion, on fairly large plates (12 by 10) has not been so much to get the boat centred on the plate. That is easy enough with any one of a host of finders, or with no finder at all, by simply taking aim along any square corner of the woodwork of the camera that is parallel with the axis of the lens, the small distance between the edge and the centre of the camera not being of importance. The difficulty is to get the boat any particular size that one wants. Let us suppose the subject is a yacht, and that the photographer wishes to get a half "side-on" view, he being either situated on another yacht, or, to take the easiest possible case, he being on the end of a pier past which the yacht is manoeuvred for his special benefit. It will not be found at all difficult to keep the camera "pointed at" the yacht, the difficulty will be to know when to "shoot" at it, and unless his experience is very different from mine, the photographer who first tries this kind of work will be very surprised at the smallness of the image he gets on development. He has probably made up his mind that he wants the image of the yacht to cover at least half the height of the plate. He has waited till he judges that it is so near that the image is bound to be of about the size to do so; but, lo! on developing the plate, he gets out a little dot of a thing, perhaps a fifth or a sixth of the size he wanted, on a great expanse of water! Of course, matters are very much mended by the use of a finder that shows the same image exactly that the actual lens is producing—or at least the same amount of picture on a smaller scale—and there are many such; but it is wonderful how difficult it is even with such to set off the shutter at exactly the right moment. I imagine the same case as before, and assume the photographer to be watching the image through the finder. He is surprised to see how little of the field the yacht occupies, and how alarmingly near it has to come before it occupies enough of it to make a picture, and how suddenly, after this, it occupies *more* than the field, or runs out of it altogether. There is, in fact, only about a second of time during which the object is just at the distance to make a fairly sized picture, and it needs considerable quickness of sight and readiness of hand both to follow the motion of the boat and to let off the shutter when she is just at the right distance.

Of course, the longer the focus of the lens, the larger the image on the ground glass, or, in other words, the greater the distance from which it is possible to photograph a boat, and get a fairly large sized image. One who has not actually tried will be astonished, even with any focal length feasible, how apparently very near a boat has to come before it gives other than an exceedingly small image. Increase in focal length means increase in size of the image. It also means increased difficulty in "aiming" the camera, as a given angular deflection amounts to a greater linear motion of the image on the ground-glass or the plate. This, however, by no means counterbalances the advantages of the greater size of image, and it may be said that the lens for yacht photography should have a focus at least half as long again as the plate, and that it will be an advantage if it is twice as long.

Even with all the aids there are to be used to assist in yacht photography, there will certainly be a very large percentage of failures. I have done a fair number of yacht

photographs on 12 by 10 plates that were at least good enough to be highly pleasing to the owners of the boats, but I have, on the other hand, spent a whole forenoon, with all the conditions favourable, with my camera balanced on an anchored floating raft, and with three or four yachts manœuvred for my own particular benefit, and have found, on development, that I had not got a single picture that could be called a success; that is to say, there was not a single picture that was just what I had intended that it should be. Either the images were too small or too large, or they were too far to one side or the other of the plate, or again, in some cases, the boat was only sailing into, or was sailing out of, the plate!

I imagine that even if the photographers who have produced the best yacht pictures were to tell all, they would confess to a very large number of failures—probably to more failures than successes.

So as the focus be long enough, the form of lens used for this kind of photography is not a thing of much consequence. Good work may be done with any good lens, and as a very large aperture is by no means necessary, a single lens, even if not of one of the most modern "rapid" forms, may be used, and, as has very often been pointed out, in all cases in which a single lens is really permissible, it is to be somewhat preferred to others.

So much has lately been written about detective cameras, that there is little more to say; in fact, there is perhaps nothing—and the little that I intend to put down here has probably all been said already.

The conditions to be fulfilled by a lens for a detective camera are, in general, the same as those for other kinds of instantaneous photography, for the detective camera scarcely needs to be considered apart from instantaneous work, but there is this difference, that, in so far as a photographer takes up work with a detective camera, he must be considered a "one-lens man." Of course, I am well aware that detective cameras have been made to be worked with several lenses, that could be applied for different kinds of work, but the very essence of detective work, it seems to me, is to be ready for *any* kind of subject at a moment's notice, and it need not be explained that this limits the user of the detective camera, *at least as a detective camera*, to one lens. This lens should, therefore, so far as possible, fulfil the conditions for all kinds of instantaneous work.

I have, above, taken two kinds of instantaneous work—namely, street views, and the photographing of yachts—as typical of the two opposite ends of the work likely to be undertaken by the amateur. It will be seen that, for one of them, a large maximum aperture is desirable, for both a comparatively long focus; and I think that the requirements of a lens for detective work may be summed up by saying that it should possess both these qualities: that is to say, that it be of long focus, and should be capable of working at a *very* large aperture if necessary. It should also be supplied with stops so that the aperture may be reduced when the largest size is not needed. A lens that I consider would be excellent for detective work is the very rapid "Aplanat" of 8-inch focus made by Suter. It works at an aperture of No. 2 U. S., which is twice that of the ordinary rapid rectilinear.

I know that there are some who will consider a focal length of 8 inches too great for a quarter-plate, or even for a 5 by 4. There are certainly several reasons against the use of a long focus for detective cameras. One of these is that the longer the focus the greater the likelihood to miss the object, and that, moreover, the longer the focus the greater the blurring, due to motion either of the camera or of the object during exposure; but I think that the pictures got by using a long-focus lens are so very much

superior to those got by the use of a short-focus that the trouble just mentioned is more than compensated for. I am in no way a great believer in detective work. I believe that nine out of ten of the photographs taken by the generality of detective-camera workers are so bad that they are never shown, and I think that of those that are shown, it were better that nine out of ten were kept from the light of day, but of those that I have seen every one of the pictures done by the detective camera, that could be considered really good, were done with lenses of comparatively long focus.

(To be continued.)

BY MAJOR J. FORTUNÉ NOTT.

APPARATUS.

THE CAMERA.—Photographers of the present day have a very varied assortment from which to make a selection when purchasing this essential piece of apparatus for the practice of their art. The instrument now is too well known to render any lengthy description of it at all necessary, but inasmuch as the long list of firms in England and America who manufacture cameras is constantly being augmented, and as each one has some patented devices, which are advertised as "improvements," it behoves a would-be purchaser to fully understand the requirements of a camera, in order to be certain of selecting a suitable article. *Experientia docet*, but the beginner, in making a start, must either rely upon the advice he is given by friends who possess some practical knowledge of photography, or upon the instructions he receives from text-books, otherwise he may find himself making a lavish expenditure upon a very ornamental but perhaps nearly useless article. To guard against such a contingency, he should learn to recognise whether a camera possesses all the adjuncts required to make it serviceable, and which should therefore be considered as indispensable, also to be able to readily discern between those features of the various makes that are absolutely necessary, those that cannot be so described but may occasionally be useful, and those that can only be classified as cumbersome fads having no practical advantages to anyone but the manufacturer who charges for them.

It should be borne in mind that a camera is simply the means to an end, and its utility is in no way enhanced by elaborate ornamentation, complicated adjustments, or superabundance of brass work. These things can in no way improve the pictures for whose creation the apparatus is intended. This is so obvious that it may at first seem unnecessary to assert it, but it is as well the fact should be emphasized, for so many patterns of cameras are now advertised in which the makers apparently must rely solely upon their handsome appearance effecting their sale, for they have very few other distinguishing merits which would warrant the exorbitant prices asked being paid for them.

The absolutely essential qualification for any camera is that in all its parts it should exclude light when the lens is capped. A thorough testing in bright sunlight is the only sure way of finding out its capabilities in this matter.

When set up, a tourists' or bellows-bodied folding camera should be as nearly rigid as it is possible to make a piece of apparatus that is not absolutely solid. To discover its merits in this direction, fasten it on a stand, put the lens and shutter on the front and a loaded double-back in the groove, then after racking the camera out to its fullest capacity, give it a slight tap and watch

the effect. If it is not well adjusted and correctly balanced, any movement or jar produces a vibration that dies very slowly out before it is again at rest. A camera with this defect should be avoided, for obvious reasons.

A camera that possesses the power of being extended to double the focal length of the longest focus doublet lens intended to be used with it, adds considerably to its value, because it permits of a single combination being employed when necessary. It should also close up so that a wide-angle lens of short focus can be used without any portion of the base-board appearing in the angle of vision. Whatever form of bellows it has, under no circumstances should any of the folds cut off rays between the lens and the plate. Many otherwise nearly perfect cameras have this objectionable fault.

An easy method of assuring the front and back being kept perfectly parallel should exist. It should fold up compactly, be easily and quickly adjusted for use, and be free from complicated or superfluous mechanisms which have a tendency to get out of order, for any utility under exceptional circumstances they may have does not compensate for the annoyance they are liable to cause. In a camera intended for tourist purposes lightness and portability are very essential. To gain these desirable qualities, it is worth while sacrificing a number of other conveniences if necessary, for when they would be required a little ingenuity can always suggest some other method of overcoming the difficulties, whereas lightness enables a camera of a good size to be carried about without fatigue, and consequently makes it an exceptionally serviceable article. A whole-plate camera with the necessary kit is the largest size that can be conveniently carried for a distance with pleasure. This remark, however, must be qualified by the statement that it only refers to three or four makes in which the extreme point of lightness has been attained without any very great sacrifice of rigidity being made.

Cameras can, of course, be ordered to any size desired. The standard makes are determined by the largest plate for which they are intended. In England the sizes run as follows:—

Lantern size being $3\frac{1}{4}$ ins. square; quarter-plate, $4\frac{1}{4}$ by $3\frac{1}{4}$ ins.; the next size being 5 by 4 ins.; half-plate $6\frac{1}{2}$ by $4\frac{1}{2}$; then one 7 by 5 ins.; whole-plate, $6\frac{1}{2}$ by $8\frac{1}{2}$; the largest sizes being 8 by 10 ins., 10 by 12 ins., and 15 by 12 ins., this last being the dimensions of the largest sensitive dry-plate dealers keep in stock.

The front is the part to which the lens is attached, and it should possess the means of being raised or lowered as required.

The focussing screen is the ground-glass secured in a frame at the back of the camera, in such a way that, when removed, the sensitive plate can be placed in exactly the same position. This back frame must be detachable, and so made that it can be replaced in a reversed position, a feature which allows the picture to be taken vertically or

horizontally. This is accomplished by making the back frame of the camera square, and although this shape may add to the weight and bulk, these drawbacks receive compensation by the fact that without such a convenience the whole camera would have to be unscrewed and reversed to accomplish the object which this simple contrivance instantly fulfils.

The back of the camera ought to be made so that it can be moved vertically or horizontally, and the point from which it is swung should, in a correctly made camera, be from the centre, the movement in the one direction being similar to that of an ordinary toilet mirror. In very few makes of English cameras, however, is the alteration of position made in this way, and the trouble caused by this fact has to be overcome in another manner, to which it is intended attention shall be drawn under a different heading. Under ordinary circumstances the screen should always be at right angles with the axis of the lens, but occasionally the movements already referred to enable a certain desired definition to be obtained, which except by their use could not otherwise be procured. It is very desirable, therefore, to fully understand the effects resulting from their employment, but under no circumstances should this method of focussing be resorted to if it can be avoided, for any of these movements tend more or less to produce distortion.

The focussing screen itself should be examined, for if any but the very finest ground-glass has been used, the coarse grain will prevent delicate objects being seen with anything like the clear definition to be obtained when the superior grade of glass is employed for this purpose.

(To be continued.)

THE London Social Camera Club will hold their annual conversation in March.

THE Devon and Cornwall Camera Club are constructing a dark-room and photographic studio.

HINTO-KINONE is a one-solution developer, which simply requires the addition of pure water to be ready for use, and it is claimed for it that it can be used for negatives, lantern slides, and bromide and gelatine papers. Like all hydroquinone developers, it does not stain the fingers.

THE Sheffield Photographic and Fine Art Company have forwarded us a neat form of changing bag, by means of which plates can easily be transferred from box to dark slide, or *vice versa*, in the open air, without danger of light access. To the tourist such a contrivance is almost a necessity.

A WELL-KNOWN WORKER IN PHOTOGRAPHY.—Dr. Haswell, of Sunderland, is, we hear, now engaged in painting a portrait of Bishop Lightfoot, whose untimely death has produced such a profound sensation in the religious and literary world. The Bishop gave Dr. Haswell his last sitting only a day or two before his journey to Bournemouth, and the portrait will, therefore, be the very last of the worthy prelate. With such melancholy interest it is sure to excite much attention. It is not improbable that the picture will be reproduced by photogravure or some other photographic process, but for private circulation only.

Our Contemporaries at Home and Abroad.

THE *British Journal of Photography*, in a leader on "A Mysterious Lantern Slide," says:—"A few weeks ago we received a parcel of French lantern slides from a correspondent, who informed us that they formed portion of some which he had taken with him to India, where they had been for two years. Observing that they had gradually been becoming somewhat obscured by a species of mistiness, he undid the binding of one of them with a view of wiping off the scum which seemed to have settled upon the covering glass, when he found that all the area not protected by the mat had become corroded. Only those slides of French manufacture were thus affected; those of English make suffered no change. Curious to know the cause of this corrosion, he sent them to us. . . . Knowing that the singular beauty of many of the French slides depends upon their being toned with mercury, we casually mentioned this when bringing the subject before the meeting of the London and Provincial Association on Thursday last week, and a clue to the difficulty was suggested by Mr. Everett, one of the members. Mercury, he said, was well known to attack glass, presumably from its affinity for lead. . . . Following up this idea, we think a valid cause of the disintegration of the glass is to be found in the fact that mercurial vapour, liberated from that imbedded in the interstices of the image by the heat of India, operated upon the glass and decomposed it." Other articles are "Photographing Interiors," "Sensitometry" (concluded), "Improvement of Faulty Negatives," "Coloured Photographs" (concluded), and "Novel Means of Remedying Certain Defects in Portraits."

The *Photographic* (Vienna) contains an excellent paper by S. Koller on the preparation of platinotype paper, and one by Anton Einsle in Wien, on "A New Method of Developing Dry Plates."

The *Eye* (Chicago), writing upon the Daguerre Memorial Fund, says:—"In the year of 1883 in France a very handsome monument was erected to the memory of Daguerre, the funds for the same being contributed by photographers from all parts of the world; even from Chicago many of us sent our mite. A bust by the celebrated Capellaro is surmounted on a pedestal about eight feet high. Now, would it not be a good thing to have a similar monument for this country?"

The *Journal of the Photographic Society of Great Britain* (December 20th) contains an interesting paper by Mr. G. M. Whipple, Superintendent of the Kew Observatory, on "Photography in Relation to Meteorological Work," read at the meeting on the 10th December. In the course of the paper he said: "I shall not attempt to go into the history of the discovery of the various instruments which were employed by the meteorologists when photography came into notice. It was soon found to be a convenient handmaid which could be brought to his aid, and would relieve him of a considerable amount of watching, by recording instrumental changes which took place during periods when he was elsewhere engaged."

The *Journal of the Photographic Society of India* (Calcutta), in speaking of the photographs submitted to the editor for criticism, says: "A few days ago a gentleman handed me a plate that was as mixed as his feelings. The subject was an open-air group, but while some parts of the figures were negative, others were positive. The general aspect was weird enough to explain fully the enquiring look of my friend in handing me his work. Of course, the more experienced of my readers must have perceived that the plate was a partially reversed negative, and that its appearance was the effect of too strong action of light, or of what is technically known as solarisation. My friend, however, believed that either the plate-maker had played him a trick, or that a certain unmentionable personage had resumed his connection with our 'black art.' He had read Robinson, and, in humility trying to follow him by having the sun facing the camera, had produced a monster instead of a picture. We may not all be Robinsons, but we can all shade our lens." The number also contains Mr. J. Gale's article, published in the *AMATEUR PHOTOGRAPHER*, on "The Natural in Photography," and one by Lieut.-Colonel J. Waterhouse on "Orthochromatic Photography."

The *Photographer* (Glasgow), in its notes, says: "There is to be held shortly a competition of instantaneous photographs, in which all amateurs are invited to take part. The arrangements

are now being made by the Council of the Italian Photographic Society. There is to be a public competition, and all amateurs, irrespective of nationality, will be invited. The exact date of the competition will be announced later on." There are also continuing articles on "Dry-Plate Photography for Beginners," "Photography on Glass," and "The Practical Printer."

The *Photographic News*, speaking of Mr. Lyonel Clark's paper before the Camera Club on "Sensitising Drawing Papers," says: "For photographic use, starch is a better substance than gelatine for the sizing of papers, and genuine Bermuda arrowroot is a convenient and easily obtainable form of starch for the purpose. In the substitution of gelatine for albumen, time may possibly prove that little or no advantage has been gained, so far as the durability of pictures printed out fully by sunlight is concerned." It deals, in other articles, with "Dark-Rooms," "The Studio Roof," "The Progress of Quinol Development," and "Artistic Feeling."

The *Photographische Notizen* (Vienna) contains articles on the magnesium-light studio of Professor Schirm at Berlin, and on the "Warm-Bath Platinotype Process."

The *Photographic Review*, in a critique on the new edition of "Naturalistic Photography"—with a copy of which, by the way, we have not been favoured—says: "We may express a pretty confident opinion that, had it not been for the fact of the old conventionalists of the photographic world so vigorously writing and talking against this 'positively outrageous work,' to use a favourite phrase, it would have fallen absolutely dead upon the market, and probably the bulk of those who can understand and appreciate it would neither have heard of it nor seen it." There are articles on "Hydroquinone Development," "The Inflammability of Celluloid," "Solar Photography," and "Blisters on Prints."

The *Photographic Times* (New York), in an article on "Subjects for Prize Photographs," says:—"For such a purpose I would suggest a series of photographs of heads or whole figures representing the emotions of the human soul in joy and grief, in happiness and despair, in innocent or vicious moods, sounding, in fact, the whole scale of emotions and passions as reflected in the human face. . . . All these and similar prize offers might be competed for by every amateur possessing a 5 by 4 camera." Other articles are on "Christmastide in Shakespeare's County," with a magnificent reproduction of a photograph of the "Weir Brake," in hoar frost; "Photographing Winter Scenes;" "Winter Pictures;" "Film Photography," with an excellent reproduction of a photograph of the facade of the Duomo of Florence; "Chemistry of Photography," etc. There is also a very fine reproduction by the Electro-Tint Engraving Company of a photograph of the head of a greyhound, which is a most successful specimen of the art.

Photography, in an article on "Exhibition Matters," says:—"That professional photographers are capable judges of technical skill cannot be gainsaid. But, as has been said, 'The obligation of labour destroys the poetry of a calling,' very few of them have been able to spare the time for studying the higher walks of art. So if the artistic quality of a photograph is to be the first consideration, it will generally be found better to secure either the services of a painter, or, better still, two or three painters, and the help of some photographer who has not to grind hard for his daily bread, but who can afford to work for love, to express a verdict on the artistic merit of the work shown." Later on, dealing with the point of "advertisement" medals, it says:—"If these awards go on increasing, we may, in time, expect to see that Mr. James Glashier and members of the Council of the P.S.G.B. have for distribution fifty handsome medals, offered by Messrs. Recketts and Colman, for the best photographs exhibited at Pall Mall mounted with their respective starches. But exhibitors don't seem to value these awards very much, as may be seen by the sorry lot of entries at recent shows; we find on consulting late catalogues that in some cases only one or two entries, in others none at all, were made in some of these private classes. Very few photographers, happily, are like the man who took his turtle to a flower show, hoping to gain a prize because it was the only one there, but value the award according to the number of competitors and acknowledged capability of the judges." Other articles are on "Colour Correct Photography for Landscapes," "Photogravure," and "Photographing in the Public Parks."

The *Photographische Rundschau* (Vienna) contains a good reproduction of an instantaneous seascape, and a charming interior by Lichtdruck process, articles on "Retouching," "The Proceedings of the Vienna Photographic Society," and shorter articles on "Cameras," etc.

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

FALKIRK AM: PHOT: ASSOC.—The usual monthly meeting was held on the 19th ult., when a lecture was delivered by Jas. Craig Annan, Secretary of the Glasgow Photographic Association, on the "History of Art Illustration, and its Relation to Photography at the Present Time," illustrated with specimens of the various processes. The lecturer handled his subject with great ability, and proved himself to be a gentleman of artistic taste.

PHOT: SOC: OF IRELAND.—A technical meeting was held at the Society's rooms, 15, Dawson Street, Dublin, on the 20th ult., Mr. Louis Meldon in the chair. Dr. Cosgrave, F.R.Q.C.P., read some notes on Ilford lantern plates relative to his experiments with those plates under varying periods of exposure to the light of an ordinary gas jet, the results obtained being exhibited at the same time through the lantern. Dr. Scott, F.R.C.S.I., showed in the same manner a set of these plates, some exposed to the light of a paraffin lamp, and some to that of magnesium wire, the developer being eikonogen with all. Very rapid results were obtained with the magnesium wire. Mr. Conan brought forward the subject of the construction, etc., of the dark-room proposed to be fitted up on the Society's premises. An interesting discussion followed, in which many of the members took part. The negatives taken during an excursion of the Society to Poula-phouca in September were handed round for inspection and criticism. Eleven new members were elected, and seven more proposed at this meeting.

WEST LONDON PHOT: SOC.—On the 27th December a technical meeting of the above society was held at the Addison Hall, Mr. C. Garner Richardson, M.A., occupying the chair. Mr. St. Clair Buxton, F.R.C.S., Mr. W. H. Whitear, and Mr. Miller were elected members of the Society. Acting upon a suggestion from the Chairman, the discussion on Mr. Stein's paper on "Hand Cameras" was adjourned until the second meeting in January. The Secretary (Mr. Hodges) informed the meeting that the annual exhibition would be held on the 10th inst., at 7.30. The exhibition would remain open on Saturday, the 11th, from 3 to 9.30. In addition to the pictures a musical programme would be arranged for each evening, and light refreshments provided. Mr. Miall, the inventor of the Facile detective camera, attended and explained its construction to the members. In reply to the following question: "Would the addition of sulphurous acid to the fixing bath have an injurious effect on the negatives?" Mr. Stein said the effect would be to liberate sulphur, which would be prejudicial to the negatives. Mr. Hodges thought it not advisable to add any acid to the fixing bath, and least of all sulphurous acid. Mr. Rickford desired to know the proper quantity of magnesium ribbon to burn when reducing half-plate negatives

to lantern size by reduction in the camera. Mr. Bennett said he had produced many slides in that way, and had found three to five feet necessary, burnt about three inches behind the negative. Mr. Winter thought the amount excessive. What plates were used? Mr. Bennett: Mawson and Swan's and Thomas's. Thomas's required more ribbon than Swan's. Mr. Cobb showed some bromide prints which had been bleached by immersing in a solution of bichromate of potassium acidified with hydrochloric acid, and after exposure to light re-developed with ferrous oxalate. The tones produced were warm brown. Mr. Hodges said the degree of warmth would depend upon the amount of re-exposure given. Bromide prints would tone to a good brown with the ordinary uranium intensifier. Mr. Leslie Selby recommended bleaching with mercury, and subsequent treatment with sulphite of soda, as advocated by Mr. A. R. Dresser. The proceedings then terminated.

MESSRS. FREY AND Co. have produced a novel form of celluloid film for positive work. This film has compounded with it sufficient white pigment to give it the appearance of ivory, and positives printed upon it have a wonderfully soft and attractive appearance. Pictures so produced can be inserted in albums in the usual way, or, printed deeper, will make admirable window transparencies.

A SUBSTITUTE FOR CHRISTMAS CARDS.—One of the two successful competitions in a recent "Suggestion Competition" for a substitute for Christmas cards, promoted by the *Birmingham Weekly Mercury*, suggested photographs of various kinds for the purpose. He put first photographs of family parties engaged at dinner, or some game, taken by the flash-light; secondly, copies of some object or objects of interest in the locality; thirdly, portrayal of the parties, with a background of some scene abroad in which they are all interested. The scheme is good, though the idea is a somewhat old one.

NEWCASTLE (STAFFS.) AND DISTRICT AM: PHOT: SOC. intend to hold an exhibition of photographic work by members early in March, with two extra classes, one open to local professionals, and one open to the members of the Utttoxeter Society, which is the only other photographic society in North Staffordshire. As no entrance fees are to be charged for exhibits, the Society itself is unable to offer prizes for competition, but three or four members are subscribing to present a bronze medal in each of the twelve classes. In the "Pure Landscape and Seascape" class the proprietors of the *AMATEUR PHOTOGRAPHER* have very kindly offered a bronze medal, subject to their usual conditions. An Exhibition Committee has been elected, and arrangements are being made to keep the exhibition open for three days, and to open it with a conversation. This will be the first exhibition of photographs in North Staffordshire, exception being made to the *AMATEUR PHOTOGRAPHER* Monthly Competition prints which have been publicly exhibited on several occasions by the Society. The Society, although it has only been in existence three months, has already a roll of fifty members.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.

2. Write each Query or answer on a separate sheet of paper.

3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editors do not undertake to answer questions by post.

6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3334. Obnetter Paper.—(1) Can the bath for this paper be used over again in the same manner as the toning bath for silver prints? (2) A hint respecting the process of filtering with kaolin will oblige. Have tried this, but only got a muddy mixture of kaolin and toning bath. (3) Does an old toning bath require to be tested for acid in the same manner as the bath for albumenised silver prints? (4) I fail in getting prints that have been squeezed on glass to lie flat when mounted. They invariably bulge out at the middle. Is there any special method of mounting this paper to get it to lie flat?—**PETARR.**

3335. Intensifier.—Would "Radiation" please inform me if Edwards' solution of pyro would suit the intensifier as well as the sulpho-pyrogallol? And if so, how many grains of pyro per ounce must be used? Should Edwards' pyro not suit, please state how many grains of pyro is contained in the 3 minims?—**T. J. O'CONNOR.**

3336. Spoiled Negative.—While in contact with Pizzighelli paper, a quantity of black spots broke out over it like black dust. I cannot efface them. The negative is a valuable one. Can these be got rid of?—**MEPHISTO.**

3337. Lantern Plates.—Can lantern plates be prepared with the same emulsion as the ferro-prussiate paper so as to obtain blue transparencies?—**LANTERN.**

3338. Platinum v. Gold.—Does platinum tone with as good effect as, and at much less expense and with greater ease than gold? If so, why is it not usually employed instead?—**G. M. S.**

3339. Oiled Glass.—If oiled glass has been used for drying and glazing prints in optical contact, is it advisable not to put more oil on for the next time, but to trust to the oil remaining in the pores of the glass?—**G. M. S.**

3340. Phosphate Bath.—If a gold and phosphate bath steadfastly refuses to tone, however alkaline, is it likely to be improved by keeping, or anything else?—**G. M. S.**

3341. Criticising Photographs.—Wanted, name, etc., of amateur photographic club where members' photographs are criticised by a good photographer and sent round every month.—**DLE.**

3342. Zincography.—I am anxious to learn zincography and process work generally. Can any one kindly tell me where I can take lessons? also can they recommend a book on the subject?—**P. S. O.**

3343. Argentine Republic.—"Gringo" would be

obliged for loan of views or negatives illustrating life in the above.—JOHN NEWTON (address with Editors).

3344. **Lenses.**—I am anxious to use with a new camera, besides a landscape lens, the front combination of a Ross R.S., but for the latter the camera is just too short. An inch and a half tube screwing into the flange of the single lens and taking at the other end the screw of the Ross, would give the extra length required and enable both lenses to be used. Would the tube cut off the view or immoderately lengthen exposure? I should be grateful for suggestions of a better plan other than lengthening the camera.—MELCHIOR.

3345. **Toning.**—Can any of your numerous readers tell me why my purple-toned prints turn to a brown tone on being placed in the hypo bath? I use the borax bath.—J. C.

3346. **Intensification.**—I intensified some of my negatives taken this summer with bichloride of mercury and iodide of potassium. Wishing to take a few more prints a short time ago, I was annoyed to find some of the negatives spoilt. The intensification appears to have gone on in the high lights, producing ugly dark patches. What is the cause and remedy (if any)?—J. C.

3347. **Cloud Negatives.**—I should be glad of information as to the best way of preventing spots on Wylies cloud negatives. It is unpleasant to be obliged to re-oil them each time previous to occasional usage. I have kept them in oiled and waxed papers.—CLERICUS.

3348. **Leimtype.**—Can any of your correspondents give me any practical information as to the working of the "Leimtype" process (or any similar process for producing relief plates), or tell me where the information may be obtained? I want a list of materials required and details of working.—RELIEF.

3349. **Photographing Flowers.**—What lens is best to use—background, method of arrangement, lighting, exposure, plates, and printing paper? Are Fry's celluloid films and the Platinotype Company's paper appropriate? Is there any manual giving directions?—S. E.

3350. **Finder.**—Can any one give me instructions how to make a finder for a detective camera? I can get some small lenses $\frac{1}{2}$ in. and 1 in. focus. A small sketch would be acceptable.—NEMO.

QUERIES UNANSWERED.

Dec. 6th.—Nos. 3274, 3277, 3283, 3284, 3286, 3289, 3290, 3291, 3293.
13th.—Nos. 3297, 3298, 3300, 3302, 3304, 3305, 3306, 3307, 3312, 3314.
20th.—Nos. 3318, 3319, 3320, 3321, 3324, 3325.
27th.—Nos. 3329, 3330, 3332.

ANSWERS.

3317. **Sensitized Paper.**—As I use a carbonate of soda toning bath, and can obtain almost any tone with and use the same plates as "Amateur," I shall be glad to give him the formula.—MEPHISTOPHELES (address with Editors).

3323. **Hydroquinone.**—On referring to Mr. H. C. Taylor's formula in the issue of Nov. 9th (not 16th), 1888, I find that the "A" solution contains 120 grs. hydroquinone in a mixture of 1 oz. alcohol and (about) 3 ozs. water. The result of a series of rough experiments made some months since to obtain the approximate solubility of hydroquinone in both water and alcohol leads me to believe that the quantity of liquid is not sufficient to take up that amount of quinol. I had had six test tubes, each containing 4 drms. of distilled water, and added 10 grs. hydroquinone to each; the first two had the water raised to boiling point, the second two had the water cold and dissolved by raising the temperature gradually, while the others dissolved the hydroquinone cold (52 degs.). None of the test tubes had more than $\frac{1}{2}$ gr. undissolved, and the next day the entire contents were emptied into a stoppered bottle. I next took two tubes, each containing 2 drms. alcohol, and added 40 grs. hydroquinone to each, which was all dissolved but about 1 gr. in each case. The contents of these latter tubes were emptied into the same bottle as before, which then contained 140 grs. hydroquinone in a mixture of 3 ozs. water and $\frac{1}{2}$ oz. alcohol. A few days afterwards I found that nearly the whole of the hydroquinone was deposited at the bottom of the bottle, instead of the 4 or 5 grs. I had expected to find, about one-half of the crystals being of irregular form, while the others were long and spinous. I have not had opportunity to go further in the matter since then, but incline to the belief that the irregular crystals are those that were dissolved in the water, and the others in alcohol. In any case I think "Enquirer" will come to the conclusion that it is hydroquinone that is thrown down in his solution, and would recommend him to use the Thomas or Ilford formulae in preference.—THE SMITH.

3331. **North Queensland.**—Ilford's are largely sent to Brisbane, and are kept in stock in all sizes by Messrs. Lither and Co., in that town.—J. H.

3333. **Spain.**—Ilford plates can be had from F. Arenas, 5, Plaza Regomi, Barcelona, who keeps all et ceteras for photography.—J. H.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT:

P. S. C.—We think that there is a decided advantage in using the plates which you refer to, and we happen to know that certain well-known workers do use them for the particular purpose specified in your letter. For ordinary use, No. 3; instantaneous, 7 or 8.

G. M. S.—There has been much discussion as to what should be an actual ten per cent. solution, but for all practical purposes it is represented by, say, one ounce of a salt or liquid made up to ten ounces by the addition of water. This, although not scientifically correct, is what most compounders mean when they direct the use of a ten per cent. solution.

PALMAM.—There are so many shutters in the market that your question is a difficult one to answer. Would it not be best for you to consult our recent back numbers, where you will find reports about many kinds, and, in some cases, evidence of their efficiency?

R. C. G.—(1) See answer to "Palmam." (2) An article on the subject will appear very soon.

G. B.—The mark is due to undissolved bromide of silver. In other words, the hypo has not fully acted upon this particular part of the print. Remedy: Move the prints about in the fixing bath, and let them have a longer sojourn there. Many thanks for your good wishes for the new year, which we reciprocate.

G. Y.—We should certainly recommend No. 1 on your list, which will act well as a single lens when required.

R. C. M.—The limelight would be most unsuitable for the purpose, and, used in the manner which you suggest, would require about an hour's exposure. You would do far better with a magnesium ribbon lamp, moving it about so as to illuminate every portion of the copy in turn, and taking precautions against any direct rays from it entering the lens. An entry form will be forwarded to you.

W. P.—You should get a text-book and read it. Your failure is probably due to under-exposure.

D. R. G.—There is no restriction as to size or shape of opening of lantern-slide mask. You can get masks of any shape at any large photographic dealers. You are quite right as to the injury often done by adapting only part of a negative to lantern purposes.

TORY.—A very pretty little picture, and one which does you credit. Thank you for your kind wish, which we return to you with interest.

"CAN'T DO IT."—Certainly, it can be done by using a 12 by 10 camera.

G. W. S.—Thank you very much; we will accept your kind offer.

E. M. T.—You would do better to buy No. 2. The firm you name are not lens makers, and there is no guarantee in buying from them. You cannot expect a lens made to cover a certain sized plate to stretch over a larger one without detriment to the picture.

Z. Q. A. (Upper Burma).—Your pictures are very interesting, and creditable under the circumstances detailed in your letter. Your exposures have hardly been quick enough to secure the best results.

C. DARLINGTON.—Your pictures show good work. We should, however, have preferred to photograph the waterfalls in actual sunlight, so as to get light and shade on the foam.

J. B.—Not bad for a beginner and considering that they are taken under adverse conditions. Do not carry your development so far, and you will secure softer results.

D. M.—(1) The two names mean the same salt. (2) The solution should be clear and light, but this would not be the case if you mixed the pyro with the water, and afterwards added the sulphite, instead of vice versa.

W. BARRETT.—Received too late.

THOS. WIDDOP.—Publishers will write you. Thanks for letter.

H. D. C.—In our opinion B is the better plate. Have never seen or used the C candle. The D lamp should give you plenty of light.

G. C. LEMAN.—You give no address, but it is hardly worth while to publish the protest you send us. The matter must drop.

E. B. GREVILLE.—Your letter shall have attention.

E. J. JACKSON.—You are quite right, and medal will be sent you in due course. You must not of course enter the same photograph in our future competitions, but you may enter other photographs in one or all.

W. R. FERGUSON.—The prints shall be returned. If you read the conditions of the "Prize Tour Competition" you will find that you are not eligible.

C. L. GREENALL.—Your letter shall receive our best attention. No doubt we can let you have the prints on the date named, but will write you.

GREENWOOD.—Will try and secure some. We think very highly of the process.

J. MCMURDO.—The remarks refer to the "enlargement," and not the negative. For "name of plate" give name of paper, etc.

Stereoscopic Slide Competition.

(Third Year.)

SLIDES have been received from:—

J. Taylor ...	Dawsbury.
C. V. Shadbolt ...	Chislehurst.
F. B. Ellison ...	Ripley.
M. W. Thompson ...	Manchester.
H. G. Williamson ...	Bollington.
F. Howard ...	Wallingford.
W. Bevan ...	Hoole.
H. G. Ridgway ...	Sunderland.
S. Griffin ...	Salisbury.
Capt. T. Lamb ...	Channel Isles.
T. R. Marriott ...	London.
F. Daft ...	Leicester.
H. Forsyth ...	Bradford.

W. H. Charlesworth ...	Huddersfield.
S. Stamp ...	Stockton-on-Tees.
T. Ferguson ...	Kilmarnock.
W. Slinger ...	Lancaster.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less, and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, from commencement to date, five vols. bound; price £2 10s., or exchange for detective camera.—Address, H. Nunn, 1, Queen's Gate Place, London, S.W.

Backgrounds.—Two backgrounds, canvas on rollers, graduated, 6s.; exterior, 7s. 6d.—Tooth, Caldecott Street, Rugby.

Burnisher, etc.—Useful burnisher, 8 in., 9s.; Lancaster's Universal stand, half-plate, 12s.; quarter-plate washing tank, 2s.; flash lamp, 1s.—M. Blacow, 110, Ulleswater Road, Lancaster.

Cameras.—Lancaster's Instantograph whole-plate, complete, as advertised in Lancaster's 1889 catalogue; £5; new.—Ward, Glen Lea, Haslemere, Surrey.

New 12 by 10 Thornton's patent tourist camera, with all latest improvements, complete with two double dark-slides, five inner frames, patent revolving back, patent turn-table, and set of three-fold sliding bottom legs, only been used a few times; approval; deposit; price £14 10s.; cost £17 10s.—W. Clare, 3, Southend, Ledbury.

Camera, Lens, etc.—Quarter Rayment's patent long-extension camera, three double backs in cases; 5 by 4 Optimus R.R. lens, condition new, in leather case, £5 5s.; Optimus plunge shutter, 20s.; Wood's washer, 7s. 6d.; magnesium hand lamp, 3s.; four-fold stand, 12s. 6d.—T. 379A, Strand, W.C.

Dark-Slides.—Set of 6 Tylar's metal dark-slides, half-plate, equal to new; 18s. lot.—F. W., 15, Canal, Salisbury.

Lenses.—7 by 5 Optimus rapid Euryscope lens, aperture f/6, nearly new; only £3.—Alpha, 8, Bath Street, Brighton.

Lancaster's half-plate rapid and W.A. Rectigraphs, 35s. and 22s.; exchange Eastman's quarter roll-holder.—Lancaster, 15, Wharton Road, West Kensington.

Lancaster's wide-angle Rectigraph quarter, new, never used; cost 30s.; sell 24s.; approval; deposit.—Jowett, 21, Cheapside, Lancaster.

Sets.—Marlow's Instanto camera, half-plate, all movements, instantaneous lens, shutter, tripod, and view-finder, splendid condition; cost 88s. 6d.; sell 60s.—Drake, Pavilion Place, Exeter.

Quarter-plate pocket camera, by Rouch, and six double backs, 50s.; pair of $\frac{1}{2}$ in. condensers, unmounted, 5s.; Rouch's patent half-plate camera, and Hare's changing box for 12 plates, £5; Diamond detective camera, £1.—G. H. Franklin, Rickmansworth.

For sale, half-plate Instantograph camera, in best

condition, fitted with Optimus R.R. 7 by 5 lens, Waterhouse stops, two double dark-slides, folding tripod, canvas waterproof satchel and case, and a few trays, etc.; £4 15s. the lot.—Apply, Alexander Albu, 2, Great Prescot Street, London, E.

Half-plate camera, Lancaster's Instantograph, latest pattern, leather bellows, and all improvements, including reversing back, fitted with fine rapid rectilinear lens and Waterhouse stops, for either views or portraits, slide, carrier, and stand, guaranteed finest order; approval; 75s.—Cooper, 9, Sussex Terrace, Markfield Road, Page Green, N.

Scott's quarter-plate camera for sale, with Ross' rapid symmetrical $4\frac{1}{2}$ in. lens, which may be made into a single lens 9 in. focus, complete in canvas case, with set of stops, printing and developing dishes, almost new; price £3 10s.; cost double; only selling to get larger camera.—F. Liddell, Mossley Hill, Liverpool.

Underwood's 1889 quarter-plate Albion set, complete; cost 52s. 6d.; used twice; bargain, 40s.—Ernest, Woodlands Mills, Stroud.

Lancaster's Instantograph half-plate camera, 1889, leather bellows, reversing back, rising and falling fronts, fitted very fine rapid rectilinear lens, fine definition, covers well, Waterhouse stops, folding stand, double dark-slide, and quarter carrier; approval; 75s.—Cooper, 9, Sussex Terrace, Markfield Road, Page Green, N.

Camera, Furnival half-plate, all latest movements,

three mahogany double backs, folding tripod, leather and canvas cases, etc.; bargain, £8.—C., 30, Brooke Road, Stoke Newington.

For sale, Lancaster's quarter-plate Merveilleux camera (1837 patent), with guinea instantaneous lens and patent shutter, perfect condition; also Lancaster's 5s. quarter-plate landscape lens; offers wanted.—Wren, 54, Adelaide Square, Bedford.

Shutters, etc.—For sale, Thornton's time and instantaneous shutter, aperture $2\frac{1}{2}$ ins., cost 25s., price 14s.; Lancaster's quarter-plate changing box, slightly damaged, cost 21s., price 7s.; one quarter-plate double back, cost 7s. 6d., price 3s. 6d.; wanted, 7 in. equivalent focus R.R. lens.—H. Wilkinson, Massey Park, Liscard, Cheshire.

WANTED.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, 1888, in exchange for "Photographic News," 1888; must be clean and perfect, with supplements.—J. Higgin, Athenaeum, Manchester.

Burnisher.—Burnisher, full-plate or larger, cheap.—Harrison, 239, Oxford Street, London.

Cameras.—A good half-plate camera, in exchange for a quarter-plate set, complete.—Mr. Jack, Adlington, Lancashire.

Camera, etc.—To exchange 9 in. burnisher and lamp as new, cost 35s., for quarter-plate camera, lens, and dark-slide.—Evans, Minehead, Somerset.

Condenser.—4 in. condenser; exterior background exchange slides.—Greaves, 190, Heyside, Oldham.

Lanterns.—Lime-light lantern, Sciopticon or similar; also portable gas generator, Chadwick's or similar, good condition.—Address, Dr. Bennett, Riverside House, Bandon, co. Cork.

Second-hand Optimus lantern, 4 in. condensers, complete; in exchange for very handsome paraffin lamp, with heavy real bronze stand, value about 30s.—H., 16, Carberry Place, Leeds.

Lantern Slides.—Good lantern slides to illustrate a popular lecture on coal mining.—Thomas Reader, 171, Hemingford Road, N.

Lens.—Ross' 8 by 5 rapid symmetrical.—Tilston, 51, Amity Road, West Ham, E.

Outfit.—Second-hand photographic outfit, quarter-plate, good condition.—H. Norris, Fernacre, Urms-ton, Manchester.

Prints.—Will any brother photographer kindly send some spare prints of general interest for sale at bazaar next Tuesday and Wednesday, for church being built here?—Rev. E. Page, Torquay.

Set.—Half-plate camera, dark-slide, lens, and stand; state price and maker.—Bertram, Kidlington, Oxon.

Slides.—Double dry-slide, book form, whole-plate, cheap; state price.—Gubbins, Galway.

Stereoscopic Camera.—Old stereoscopic camera.—Hum hries, 29, Grafton Road, Holloway, London.

<i>Seventh</i> "	1 11 6	" " "
<i>Eighth</i> "	1 1 0	" Certificate.
<i>Ninth</i> "	15 0	" " "
<i>Tenth</i> "	10 6	" " "

All photographs and MSS. must be endorsed "Prize Tour Competition," and addressed to the

Editors, AMATEUR PHOTOGRAPHER,

1, Creed Lane,

Ludgate Hill, London, E.C.,

on or before the 28th of February, 1890.

NOTE.—A copy of rules, form of declaration, and competitor's form will be sent on receipt of stamp.

PHOTOGRAPHIC QUARTERLY.

Illustrations for future Numbers.

It is intended in the future numbers of the "PHOTOGRAPHIC QUARTERLY" to present Subscribers with a Photogravure of some well-known Photograph. Will the Readers of the "AMATEUR PHOTOGRAPHER" fill up the annexed Coupon, with the Title of Picture and Name of Photographer whose work they consider most suitable for the purpose. The publishers will endeavour to reproduce the Photographs receiving the largest number of votes.

If preferred, Title of Picture and Name of Photographer may be sent on a Post Card, but in any case the Name and Address of the Voter must be given.

The Coupon or Card must be returned on or before Monday, the 13th of January, 1890, addressed to:—

The Editor, "PHOTOGRAPHIC QUARTERLY,"

1, CREED LANE, LUDGATE HILL, LONDON, E.C.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

NOTE.—All Communications for the Editorial Department are to be addressed to—
The Editors,
"Amateur Photographer,"
1, Creed Lane, Ludgate Hill,
London, E.C.

The Editors are "At Home" on Tuesday Afternoons from 2 o'clock till 5.

We are sure our readers will be much interested to read Mr. H. P. Robinson's "Complete Photographer," which commences in this number. Mr. Robinson's teaching contained in the dialogue can but be for good, and the admirable light set of his remarks will afford much pleasure to those who study our columns.

* * * *

PHOTOGRAPHY is being written upon in journals and magazines of all kinds, but we believe the articles being written for the *Art Journal* by Mr. H. P. Robinson upon "Winter Photography" are the first of the kind published in that admirably conducted journal. It is a proof, if proof were needed, that the world of art and artists are keenly alive to the necessity of studying and making themselves masters of photography. Whilst writing upon the doings of Mr. Robinson we would mention his contribution to the *Photographic News* upon the life and work of O. G. Rejlander. Mr. Robinson is well able to tell of his wonderful works, having made his acquaintance in the year 1858, and until the day of his death kept in constant touch with him and the work that he was engaged upon. We cordially commend the article to the consideration of those who visit or have visited the collection of Rejlander's photographic work now on view at the Camera Club.

* * * *

Will readers of the AMATEUR PHOTOGRAPHER kindly send in the coupons with their vote as to the best illustrations for the PHOTOGRAPHIC QUARTERLY? All coupons must be received on or before the 13th inst.

THE PHOTOGRAPHIC QUARTERLY has come in for considerable commendation, and the frontispiece, "Harmony," is much approved. The April number will be, if anything, in advance of either of the numbers that have been published.

* * * *

BINDING and reading cases for the PHOTOGRAPHIC SOCIETIES' REPORTER are being prepared. The REPORTER will make a very useful volume for the libraries of photographic societies, and our publishers will be glad to receive orders. The number of volumes at their disposal is exceedingly limited, owing to the very heavy call made for the back numbers.

* * * *

For some time we have been busily engaged in preparing the first number of the AMATEUR PHOTOGRAPHER *Prize Pictures*. If the one about to be published is appreciated by the public and proves a commercial success, others will speedily be issued. No. 1 will contain five reproductions of Mr. Alex. Keighley's photographs contributed to the AMATEUR PHOTOGRAPHER "Home Portraiture Competition," and for which at the hands of the judges he was awarded our gold medal. The pictures reproduced are "A Thorn in the Foot," "Times is Bad," "Gee Up," "See-Saw," and "Who's Coming?" An essay upon "Photography as a Recreation" accompanies the photographs, and also a short description of the pictures. The book will be "got up" in a highly artistic manner, and will, we feel sure, prove very acceptable to many of our readers at home and abroad.

* * * *

NEXT week we shall publish particulars of the "Competitive Papers," and also the "Competition Prints." We are sure that both these competitions will be extremely popular during the year.

* * * *

We must remind ladies and gentlemen to whom the competitive prints are being loaned that they must send them forward without fail on the day named in our advice

For Contents, Prize Competitions, Notices, etc., see page 32.

letter. If this is not done, great disappointment and inconvenience will result. We have fixed the dates close together, in order that many may see the work of their brother photographers, but all our plans will be upset *unless* every recipient acts in strict accordance with the instructions given.

* * * *

THE Crystal Palace Photographic Exhibition is already an assured success. The applications for space, especially for those charmingly arranged alcoves, are far in advance of any previous years. It is intended to increase the prize-list. We have received the following special notice:—

"In deference to a generally expressed wish, a special class will be formed in addition to the published schedule, and a silver medal will be awarded for the best picture, irrespective of subject, to be selected by the judges from amongst those pictures which have never been previously shown at a public exhibition. Pictures entered for this prize will be equally eligible for award in their several classes. Two additional silver medals will also be given by Mr. Buchanan Wollaston and Mr. J. F. Peasgood—(A) one by Mr. B. Wollaston for the best picture, irrespective of class, in the amateur section; and (B) one by Mr. J. F. Peasgood for the best picture, irrespective of class, in the professional section, neither picture having taken any other award in this exhibition. The whole of the exhibitors in the apparatus division will be asked to adjudicate upon these supplementary awards."

The last paragraph savours of the popular vote.

* * * *

WITH regard to the pictures for our "Prize Tour Competition," we would remind intending competitors that it will be a very great convenience if the photographs, whether framed or unframed, are sent in as early as possible. On no account will any photographs be received after the 28th of February. The work of registering and cataloguing is likely to be very heavy, and the time at our disposal for hanging them at the Crystal Palace will be exceedingly limited. We must therefore urge competitors to forward their work as early as possible. We will undertake to frame photographs for competitors, and upon receipt of the number and size of mounts will forward memorandum of cost.

* * * *

THE remarks made above apply also, as far as promptness in sending in, to the Lantern Slide Competition. The work of registering and titling is considerable, and if the slides are ready we shall be glad to have them as early as possible. The last day is the 14th of February.

* * * *

THE stereoscopic slides will be adjudicated upon by Mr. A. Stroh, to whom our grateful thanks are due. They will be placed in his hands this week, and his award may be looked for in an early issue.

* * * *

WE have received a very encouraging letter from Mr. W. McLean, of Forbes, New South Wales. He says:

"For a long time past I have been a subscriber to your interesting and instructive paper, and have many times felt desirous of entering photographs in your different competitions.

"You will at once see that in the ordinary way this is simply impossible, as I do not receive your paper until after each month's competition is over and dealt with.

"My object, however, in now writing to you is to request that you will, if possible, kindly allow one or more of the photographs forwarded by me under separate covers to compete in any Monthly Competition for which eligible.

"I have no idea how my pictures will compare with those of

the no doubt many amateur photographers who take part in the interesting competitions; but even if not successful in being worthy of a prize, the copies forwarded may be of some interest to your many subscribers and friends, as showing pictures of subjects in this remote colony, and taken by an amateur whose skill, such as it is, was acquired entirely from the study of books on photography, and the careful reading of the pages of the AMATEUR PHOTOGRAPHER from time to time.

"P.S.—I see photographs are given by different amateurs to the 'Hospital Albums.' After my pictures are dealt with by the Editors of the AMATEUR PHOTOGRAPHER, I shall be pleased if they are accepted for this purpose."

The list of subjects which will be fixed as being those for competition each month, will enable our friend at the Antipodes to compete. The photographs are, considering the disadvantages under which Mr. McLean works, of fair merit; they are not quite up to exhibition standard, but would doubtless be of interest to many who have friends in the colonies.

* * * *

MANY of our readers know what an enthusiastic worker in photography we have in Mr. Paul Lange, the immediate Past President of the Birkenhead Photographic Society and the present President of the Liverpool Amateur Photographic Association. This gentleman spent a considerable time in Norway last year, and took a great number of photographs. He has from these selected about 100 for illustration by the lantern, and is announced to give a lecture on Norway upon the 24th January. We are sure that the views and lecture will be much appreciated by a large audience.

* * * *

WRITING upon the QUARTERLY, a correspondent says:

"I cannot refrain from writing to congratulate you on the last number of the QUARTERLY. The reproduction, "Harmony," is simply exquisite; the expression, pose, and tone are indeed most artistic; it is certainly the best reproduction of its kind I have ever seen. The photogravure of J. W. Swan is simply perfect. Altogether it is a model number, and I heartily wish you every success."

* * * *

NEXT week we shall comment upon the photographs exhibited at Keighley. Owing mainly to the exertions of Mr. J. A. Robson, the admirable Secretary of the Institute, the exhibition is a great success. The photographs are, perhaps, not quite as numerous as heretofore, but the general average of merit is considerably in advance. This is proved by the fact that, except in one class—"Lantern Slides," professional—no awards were withheld. The Institute is to be congratulated upon the exhibition, for the first time, of Mr. H. P. Robinson's new picture, "A Gossip on the Beach."

* * * *

WHEN loaning the photographs contributed to AMATEUR PHOTOGRAPHER Competitions, for exhibition at social gatherings, we felt assured that it would be a means of advancing photography. Although they have hardly commenced their journeying, the formation of another society has resulted mainly from their exhibition. In another column we give a short report of a "drawing-room" meeting held at Louth on the 3rd inst., when it was unanimously resolved to form a photographic society. The Hon. Secretary, Mr. S. Francis Clarke, L.D.S., of 8, Upgate, Louth, will be pleased to hear from any workers in photography who may be desirous of joining the society. Mr. Clarke, in writing us, says—

"It becomes my pleasant duty to inform you that at the

drawing-room meeting of amateurs held here on Friday last (Jan. 3rd), a most hearty vote of thanks was unanimously passed to you for the loan of pictures, 'Hayfield,' 'Seaside,' 'Animal Life,' and 'Inland Scenery,' which I assure you contributed much to the success of our meeting.

"From the enclosed report, which will appear in the local press, you will see that we 'resolved to establish a photographic society for this part of Lincolnshire,' and that for the present I act as Hon. Secretary.

"If, sir, with your usual considerate kindness, you could find an opportunity to draw the attention of amateurs in this part of the country whom I may not have been able to reach, to the movement, and that I shall be pleased to communicate with anyone interested, you will greatly aid the establishment of the new society.

"Personally I again thank you for so kindly sending the photos, and which were again sent 'on journey' by the noon train on Saturday."

* * * *

THROUGH the kind courtesy of Mr. C. H. Bothamley, F.I.C., F.C.S., we had an opportunity this week of inspecting the whole of the buildings belonging to the Yorkshire College. In them we found much to interest us, and were, perhaps, most struck with the universal use of the lantern as a means of illustrating almost every section of science taught in the College. Mr. Bothamley has consented to write an article for the April number of the QUARTERLY upon the "Use of the Lantern in Connection with the Teaching of the Sciences."

* * * *

ABOUT PATENTING.

It has been estimated that of those who take out patents in this country for the protection of their inventions ninety-nine out of every hundred are losers by the transaction. This statement, which we believe is founded on good authority, should deter those who are anxious to distinguish themselves as patentees; and it is no secret that there are large numbers of amateur photographers who are tempted to step in that direction. It is noteworthy that the more simple the thing patented the more is it likely to pay the inventor, always provided that it is of such a nature that it can be utilized by the million. A case in point is the notion of perforating the spaces between the rows of postage stamps, about which there is a legend to the effect that the inventor thereof became a millionaire. This we are much inclined to doubt, for we know that Government departments are not too lavish in their treatment of inventors. But another more recent case is that of the little glass marble which is now so commonly used instead of a cork for bottling mineral waters and effervescing drinks generally. This little contrivance has, we learn, brought a large fortune in royalties to its fortunate inventor. Another example is found in the carbon thread which is rendered incandescent in the electric glow lamp, which Mr. Swan of Newcastle (of photographic fame as well) was the first to think of. There are many inventions, on the other hand, of a far more complex character, such as calculating machines, type-setting contrivances, and the like, which, from their comparatively small employment, can never repay the clever men who have spent their lives, and perhaps all they possessed, in perfecting them.

Although our patent laws have, within recent years, been revised and been rendered more convenient to the poor inventor by spreading payment of the fees over a longer period, the fees themselves have not been much reduced. To the disinterested outsider it would almost seem as if the Government strove their hardest, by imposing this tax upon

ingenuity, to prevent people inventing anything at all. Indeed, they might as well say "the man who commits the crime of inventing anything for the benefit of his fellows is subject to a penalty of two hundred pounds," for the sum of the fees payable in order to protect an invention for the full period amounts to about this sum.

But there is one glaring enormity connected with the Patenting Office, which were it practised by anyone in his private capacity would be called by a very ugly name indeed. As an instance of what we refer to, let us suppose that A. has conceived the idea of a certain form of camera, and thinking that it would be a good thing to patent it, he obtains provisional protection on payment of certain fees. In a few days' time the same idea occurs to C., who spends his money in protecting the same invention. Dozens of unfortunates may follow in the wake of these pioneers, and their fees are taken for a thing which has already been sold to another. A case of this kind recently came under our notice, where the victim had obtained, as he believed, provisional protection for his invention, and had paid the initial fee. He afterwards ascertained that another had obtained protection for the same idea a few days previously. And he subsequently received from the Patent Office, at frequent intervals, some dozens of circulars headed "Notice of interference," each circular intimating that a fresh victim had paid his fee for that which it was impossible to assign to him.

In America the patent laws are far more fair to inventors than they are here. We understand that a single payment of seven pounds will protect an invention for a period of many years. And that payment of this sum is not demanded until search has been made by the authorities in order to ascertain whether the inventor has not already been forestalled by another. The wisdom of making the business of patenting easy and cheap is seen in the wonderful variety of small and unconsidered trifles which are patented by our American cousins. These come over here in vast quantities, and are commonly called "notions." We are accustomed to regard the Americans as unusually clever and ingenious, for the reason that so many of these useful little devices are put upon the market, and our own artificers seem dull in comparison. But we venture to think that if our English inventors had the same facilities for patenting that the Americans possess, they would not be behind them in production of "notions."

Under existing conditions patenting an article is something like a delusion and a snare, and should not be entertained by anyone unless he has some capital at his back, for the protection, when obtained, does not prevent others from manufacturing the patented article, although they can be stopped in their nefarious operations by an action at law. But, as we all know, law is an expensive amusement, and the poor patentee cannot obtain justice unless he is prepared to pay for it. We, therefore, advise amateur photographers when they invent anything new to arrange with some good house to finance the thing for them, and to be content with a royalty upon its sale. Our photographic apparatus manufacturers are so enterprising that they will not let a good thing slip, and a more honourable class of men does not exist.

NORTH SURREY PHOT. SOC.—The annual exhibition and soirée of this society is to be held at the Norwood Institute, Knight's Hill, on the 20th inst.

Letters to the Editors.

FUNDS REQUIRED.

SIRS,—Some time ago you kindly noticed in your leader, the Homes for Orphans, Swanley, Kent. I soon after favoured them with a trial order, and am very much gratified at the result as to work, which gives great credit to the boys and their tutors.

I have no doubt you are aware they are in want of funds to carry on the work. May I ask my brother amateurs to give a helping hand, by sending them printing to do, and selling the same at bazaars, and handing the profits to the institution. I am sure it will be the means of making good use of surplus negatives, that may be utilised to a good purpose. Of course the negatives would be returned to their respective owners. Should your readers require price list, I should advise them to send for one, as the prices are very reasonable, and the prints could be sold at a very reasonable price and ensure a good sale.

This appears to me a means of turning photography to a good purpose, and hoping your readers will give a helping hand. Could not a fund be opened in the AMATEUR PHOTOGRAPHER so that every reader could subscribe his mite?—I am, sir, yours obediently,

J. C. DAWSON.

January 6th, 1890.

* * * *

PHOTOGRAPHING AT BOULOGNE.

SIRS,—In June, 1886, I addressed to you a letter setting forth the extortionate demand of sixty francs made to me by Monsieur de Guildbont, the treasurer of the cathedral, for permission to photograph the interior of that church. Perhaps Mr. Strickland, who, in his letter of the 26th December, gives his experiences of the photographic capabilities of Boulogne, can inform his brother amateurs whether the above prohibitive tax has been removed or not.—Yours faithfully,

GEO. H. VERNEY (Lt.-Col.)

January 3rd, 1890.

CHEAP PLATES.

SIRS,—In last week's issue a correspondent expressed his wonder why not all plate manufacturers were ready to supply half-plates at the rate of 13s. the gross, at which rate he had been in the habit of purchasing. The answer is, that it would not and could not pay in a legitimate way of business; that is to say, with a reasonable profit to both manufacturer and dealer. At least one plate factory has recently shut up altogether, and probably it has been to realise stock therefrom that half-plates have been sold at the price mentioned.

Compared with the 1s. for quarter-plates, 2s. 3d. for half-plates may seem high, but the fact is that it is the former price which is unfairly low. Some manufacturer has originally started the 1s. for a dozen quarter-plates motion, probably as an "advertisement cry," and then everybody has had to follow suit, although the game must be about as nearly profitless as it is possible for a thing to be that does not actually bring a loss. Therefore it is not fair, nor is it ever likely to come about, to demand the rates for the larger sizes of plates to be regulated by the price for quarter-plates.—I am, gentlemen, yours obediently,

January 4th, 1890.

ARITHMETICIAN.

SIRS,—Referring to the remarks of your correspondent, "A Country Cousin," I, in common with, I am sure, many other amateurs, would be glad to know where half-plates at 13s. per gross can be obtained. Considering these are days of competition, I am surprised the price keeps up, as the profit on them is very large, and the trouble of coating, etc., is much less than that of collodion, and not unhealthy like the latter.—I am, sir, yours truly,

January 6th, 1890.

E. B. K.

GLAZED-SURFACE PRINTS.

SIRS,—I have read your leader on the above subject, and whilst I can fully appreciate the genuine, artistic merits of matt-surface prints, such as platinotype and bromide paper yield, I own to an appreciation of a well-burnished print also. I think if we were to adopt the plan of producing our prints in the several styles, we should be able the more fairly to judge whether such and such a print presented the best effect on either the one or the other kind of paper. Probably for view work the matt

surface lends a charm often from the original negative having been taken with the lens stopped down so as to yield unnecessary sharpness, and in such case the excellent softening effect of a platinotype or bromide print is advantageous.

On the other hand, I often experiment by printing portraits in the two styles, and, provided the negative is a good one, and *not* as sharp as a common line engraving, I give the preference to an albumen print with a finely-glazed surface.

Perhaps I may add one word as to obtaining this polished surface without any trouble or risk to the print. I notice your remark that when squeegeeing prints on glass or other material a careful use of chalk or talc is necessary. Now, this is a tedious and not always successful plan, and to obviate all difficulty and risk I may mention that there is a special enamelled metal plate in the market that only requires to have the wet print squeegeed on to its surface, and to be left to itself to dry without heat. When dry, the print falls off of its own accord! It never requires touching, and never refuses to fall off of itself when quite dry. No preparation of the plate is necessary, no talc or chalk required. I had the pleasure to send you one of these plates some time ago, and now enclose a print for you to see the surface it imparts. Perhaps I may add that these metal plates are obtainable at Messrs. Fallowfield's, or of Mr. Gotz, of Buckingham Street, Strand.—I am, sir, yours faithfully,

January 6th, 1890.

C. HETHTON LEWIS.

NOTE.—The prints sent have a high glaze.—EDS. A. P.

* * * *

NEGATIVE EXCHANGE CLUBS.

SIRS,—May I state here that the official year of the above clubs which I am connected with has expired, and I shall be glad if members will hurry up with the boxes, so that I may start afresh with the new year; also, I shall be glad to hear from any wishing to join, and also from those who were members of my different clubs if they wish to continue so, on account of getting new boxes made and cards printed.—I am, sir, very truly,

January 7th, 1890.

WENTWORTH A. J. CROKE.

* * * *

PRINTING IN CARBON.

SIRS,—Is it usual with workers in carbon to print by means of magnesium? I find that from half-plate, portraits may be printed in a few seconds in portrait purple with an expenditure of 12 ft. of magnesium ribbon, equal to 30 grs. in weight. Six inches of ribbon prints a quarter-plate papyrotype, a bichromated gelatine without pigment.—I am, sir, yours faithfully,

January 6th, 1890.

GEO. W. BASKETT.

* * * *

IS HYDROQUINONE POISONOUS?

SIRS,—In propounding the above query, my object is to discover if any of your readers have experienced any ill effects from its use. Of course I do not want to contemplate its effect taken internally, but can one be affected by its absorption through the pores of the skin in a similar manner to bichromate poisoning? My own experience decidedly points to the affirmative.

In the middle of last summer I returned from a tour, and developed about six dozen exposures with hydroquinone and a caustic alkali, shortly after which every small abrasion of the skin, not only on my hands but on the legs, refused to heal, and grew in a few days into a painful ulcer that obstinately refused to close up. I little suspected the real cause, and when my usual remedy in these cases—viz., a good sharp knife—failed, I went to the best medical man I knew, who prescribed for me under the idea that it was simply a case of bodily weakness. However, his drugs did no good, and I went away for a time, and gradually recovered. When I returned home I developed some bromide prints with hydroquinone, and next morning had the old symptoms returning at once. Thus the cat was out of the bag, and ever since I have been very careful to keep my fingers out of the developer as much as possible, and by this means have not been troubled since.

Now that hydroquinone is so generally used I certainly think that a question like this is worth discussing, more especially as I see in a contemporary, "A member of the Photographic Society of France states that hydroquinone is as poisonous as the alkaline bichromates, and will produce painful and obstinate ulcers"—which would seem to confirm my theories.—Yours truly,

January 8th 1890.

A VICTIM.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

BY H. P. ROBINSON.

CHAPTER I.

(Compartment of a Railway Carriage. Enter PHOTOGRAPHER to ANGLER and PAINTER.)

PHOTOGRAPHER: Good morning, gentlemen. We all seem bent on taking our pleasures in the country; do you travel far?

PAINTER: The sunshine of the early year is so tempting as to draw all lovers of the country as with a magnet. I cannot resist a run out, although I shall probably idle away the day.

PHOTOGRAPHER: Neither do I expect to do much the first day out, except, perhaps, over-expose some plates in this sudden brightness after so long a winter.

ANGLER: You don't seem to remember me.

PHOTOGRAPHER: Why, my old friend! We have not met for years! What with your having been out of England so long, and my jumping into the carriage so suddenly, I did not recognise you. We will chat over old times anon. You seem to be going fishing?

ANGLER: Yes, like St. Peter, "I go a-fishing." I also have been tempted by the freshness of the spring. Yet, what is food for your art will be poison to mine. I cannot expect to catch many fish in this brilliant sunshine, yet a rod, like a camera or a sketch book, is an excellent excuse for a stroll by the river.

PAINTER: I have often felt an inkling for photography, but I have feared it may interfere with my legitimate occupation, and perhaps spoil me as an artist. I know several friends whose art has deteriorated since they took up your craft. The fatal facility of the camera has made them lazy over the study of nature. Instead of sitting down before "a bit," and steadily working away, taking in colour as well as line and light and shade, they have been content to bring home nature in a plate-box, and accept her at second hand.

PHOTOGRAPHER: And it serves them right if their work loses quality. Photography should be practiced for itself, and not as a handmaid to any other art, although I admit there are many ways in which it may be legitimately useful to a painter, and even advisable for his use if taken in moderation. It is complete in itself as far as it goes. The photographer can "express himself" without any outside help, and so should the painter. Yet there is no reason why the painter should not practice photography, and carry it to its legitimate issue. The best photographers have been those who were trained to art and had begun with painting.

PAINTER: I happened to go with a friend to the last conference of the Camera Club, and heard a well-known A. R. A. interpolate a remark in a paper he read to the effect that there were only one or two artists among the photographers, and that even that was a mistake, as nature had evidently intended they should be painters.

PHOTOGRAPHER: Ah! I remember it. I know him well. He is nothing if not severe, and perhaps a little paradoxical. Painters are beginning to recognise that there is a good deal of art in photography, and that those who know how to make pictures by its aid are increasing.

ANGLER: Yet how I longed for a camera in my travels! There is such a lot of drudgery in photography, such a lot of uninteresting study to go through before you come to picture-making.

PHOTOGRAPHER: Not necessarily. It is no longer compulsory to have a profound knowledge of chemistry, optics, and cabinet work, although all are interesting, and even the painter should have some knowledge of the constitution of the materials he uses. There was a time—hundreds of years ago—when painters had to make their own paint, or keep colour-grinders in their studio. In the words of the song, "They never do it now." In the old days of wet photography it was necessary for photographers to know something of chemistry, but it is not so now for a picture-maker by photography to know more on this side the art than how to use the materials supplied to him by men whose business and interest it is to supply them of the best. Fancy a great artist now-a-days trusting himself to paint anything of greater value than an experimental picture in home-made colours! Reynolds tried experiments, and his posterity suffers.

ANGLER: Then photography is not a science?

PHOTOGRAPHER: No. Photography is the art of using certain materials to produce certain results. The invention and production of these materials is science. Art and science are far apart; this was well recognised at the late Paris Exhibition, where an enormous space, occupied by the industries, natural products, and mechanical appliances of the whole world, intervened between them.

PAINTER: We are not safe yet as regards the permanence of our colours. There is another side to the question. The earliest oil painters made their own colours, and their work stood. See the wonderful Van Eycks in the National Gallery, which are as fresh as they were 400 years ago. Notice also, while you are about it, the exquisite finish of these pictures. There was no impressionist nonsense in those days to advocate the beauty and naturalistic effect of scamped work, manufactured to suit a passing market. Then, on the other hand, look at Turner's pictures; he bought his colours, and the works of the greatest landscape painter of any age are perishing.

PHOTOGRAPHER: We can match you even in fading, modern and ancient, as in nearly all else. Photographers made their own albumenised paper at first, and their works stood; they buy it now, and yesterday's print fades. But that does not affect my argument, which was that photographers can buy their materials better than they can make them, and that it was as legitimate to do so as for painters to buy their colours.

PAINTER: You suggested there was a parallel between painting and photography?

PHOTOGRAPHER: There is a great analogy between the two arts, so great that it is worth while to follow it out. The early painters, as I have said, had to make their own paints, or have them made in their studios; they do not do so now. The early photographers had to prepare their own materials, but there is no necessity now; it should be a distinct business. Raphael, Leonardo, and Michael Angelo, or their assistants, ground the colours used, and prepared their own walls and canvasses, but we don't hear that Leighton, Millais, or Watts do the same thing; they prefer to send to Newman's or Winsor and Newton's, and get the work done better without bothering their heads about it. It is no more necessary for an artist-photographer to prepare his own plates than it is for a painter to prepare his canvass. If he does, his work is sure to suffer, for he cannot make them so well as a man whose business it is. I grant you that admirable plates are made by amateurs, but are they not rather, in this capacity, amateur chemists than photographers?

PAINTER: You are making rather sweeping assertions.

PHOTOGRAPHER: Yes. I am stating the case boldly. Photography is so often thought to be a matter of scales

and weights, and $x-y$, and $f/32$. But I think the time has come when photography proper should begin where chemistry leaves off. I could carry the parallel much further, but will content myself at present with one other, one that will perhaps startle you, but I will state it without insisting on it. There is the sculptor and the photographer. Taking into consideration their methods of proceeding only, I do not know which is the greater artist.

PAINTER: Oh! come!

PHOTOGRAPHER: I thought I should astonish you. Both artists—I mean in the higher phases of both arts—imagine their subjects. They both work out their subjects by aid of a machine. The pointing machine of the sculptor is quite as mechanical as the camera, and the work is nearly always done by assistants; now the camera for the highest work is not left to operators. When the statue is wrought out by assistants by aid of the machine, the sculptor goes over it and gives a finishing touch here and there. In fact, he does the retouching!

PAINTER: You have forgotten one very important fact. The sculptor makes a model of clay. This is really the important part of his work, where the imaginative faculties are exercised.

PHOTOGRAPHER: I am not beaten yet. One is so apt to judge of an art by what one sees every day. It is not the policy of an artist to show you all the little difficulties he encounters, and the method he uses on his way to his perfected work. You see an amateur unlimber and shoot without much thought, and think that is how all photographs are made. But I have seen different to this. I have seen a dozen sketches, some of them completed drawings, and perhaps a dozen or twenty small preliminary photographs of parts or variations, all tending to the production of one picture, to be executed by photography. Is that good enough?

PAINTER: That never struck me before, but it seems plausible—only plausible, mind you. But, oh! the difference in results!

PHOTOGRAPHER: Matters of degree, not principle. Of course, photography cannot produce a statue, any more than a sculptor can give you a landscape, although both try sometimes and fail. We all have our limits, and should respect them. There is still too much attempt to make the productions of one art look like those of another. We are emerging from the age of sham, and things are coming right, yet there is still a desire with some photographers that their work should be taken for drawings, or engravings, or etchings, or anything but photographs.

PAINTER: The sculptor puts life and soul into his inanimate statue; the retoucher takes out any life there might have been in the photograph. Your simile is strained here.

PHOTOGRAPHER: It is very clever of you to say that. It is, perhaps, new to you to compare a first-rate artist with a blundering photographer, but it is an old dodge. There are few of the former, and many of the latter. I, of course, only intended a sculptor and retoucher of equal skill in their respective arts. Let us for once reverse the usual course, and take the mean controversial advantage of comparing the bad sculptor or painter, of which there are many, with the best photographers, of which there are few. Then photography will come out as a fine art, and sculpture and painting as mechanical trades. Anyhow, I hope I have convinced you that it is no more necessary for a photographer than a painter to go deep into chemistry, and that you may become a complete photographer without becoming a complete chemist. We should, of course, be very grateful to those who have invented tools, materials, and processes for us, but it is the business of the artist to take the goods

the gods have provided, and show their gratitude by putting them to the best use.

ANGLER: This conversation reminds me of that between a Fisherman, a Hunter, and a Falconer, in Walton's "Angler," a small copy of which delightful book I have in my pocket. I would that I could be your pupil as Venator was that of Piscator. I have the advantage of Venator. He was a raw recruit to fishing, while I have had some little experience of photography, and know that you must look at the focussing screen and not through it. I have several friends who practice the art, and have seen their operations.

PHOTOGRAPHER: It is difficult to find anyone who is entirely ignorant of the elements of the art, but there is much to learn. In the words of your master, "Tis a match, sir." I also am a student of old Izaak, not that he knew, or professed to know, much about the only part of the Angler's art I care for—fly-fishing. But I enjoy the dainty quaintness of his style; his simplicity; his delightful faith in the wonderful stories of fish he gives, and the astonishing ignorance of natural history of little more than two hundred years ago makes this a book for half an hour and for all time. We are now nearing our station, and while our friend the painter loses himself in the mysteries of tone and tint, we will hold our first discourse on the banks of the stream. You will not find much use for your rod to-day, but put it together, and if the fish begin to rise we can break off, and you can tempt them with your lures, and I, peradventure, may have a chance of a shot at you struggling with a lusty trout.

(To be continued.)

Winter Work.—XIV.

By T. C. HEPPORTH, F.C.S.

CLOUDS IN LANTERN PICTURES.

No one will deny that a lantern picture is often improved by the addition of clouds, and if these happily appear in the one negative so much the better. Sometimes clouds are so buried in the over-dense sky of the negative that it is a difficult matter to get at them. Sometimes local reduction may be advisable, and if the worker is afraid of doctoring his negative with chemicals, after he has looked upon it as finished and done with, he may with advantage adopt that mechanical mode of reduction which is possible by rubbing with old linen moistened with alcohol. (This method will, by the way, often unearth the details of a church window, which before had been lost in halation.) If, however, there are no clouds in the negative, and a large expanse of white is the printed result, we must adopt other means to remedy the defect, for defect it is. In the case of a snow scene, or, indeed, any picture where there are brilliant high lights, the sky can be toned after printing by exposing it to light, shielding the rest of the picture. It can even be done after partial development—the redevelopment finishing the landscape and toning the sky at the same time. But when actual clouds are requisite, a separate cloud negative must be used. The work is by no means as easy as it is in the case of a silver print on paper, for the reason that so much judgment is required during the exposure, first of the landscape, and then of the sky negative, the actual results not being apparent until development. Some advocate the printing of the sky on a separate plate, and then making that plate the cover glass of the finished slide. But the difficulties are increased by such procedure, for the image of the clouds is reversed. I believe that the best plan to adopt is as follows. First of all select the sky negative for

use, taking care that the clouds are lighted from the proper direction. (To make all safe, it is as well to make a trial silver print from the combined negatives, in order to see if one is really fitted to the other.) Next fix a 3-inch mask on the glass side of each negative, so that the lantern plate can readily be removed from one to the other, and will be in register for both. Measure the height of the horizontal line on the landscape negative, and if it be, say, an inch and a half from the bottom of the paper mask referred to, make a pencil mark at that height on the mask which is affixed to the cloud negative. Now give the necessary exposure to the landscape—preferably by gaslight, as then there is plenty of latitude—and then (by ruby light) remove the plate from its frame and place it in another frame, on the cloud negative. Fasten it up securely, turn the frame over, and note the position of the pencil mark on the mask. Now turn up the gas once more, and during exposure shield that portion of the plate below the pencil mark with a piece of card. Keep the card in motion well above the mark so as to get a graduated tint, and after due exposure turn down the gas and prepare for development. Be sure to have at hand a ten per cent. solution of bromide, with a camel-hair brush in it ready for use. It may not be wanted, but if it should be, it will be wanted badly. For instance, the sky may soon show that it has received more than sufficient exposure, while the landscape has not had enough and hangs back. In such a case, rinse the sky portion of the plate, and paint it over with the bromide solution; then redevelop. But a little practice with this method of double-printing will render such dodges unnecessary, for the operator will soon acquire the habit of exposing his plates to suit the needs of both negatives. But when all is said and done, the best effect is to be obtained when the one negative is adorned with natural clouds. Very often in this climate clouds are more common than is desirable, especially as they generally hold a remarkable quantity of rain; but on the sunny days vouchsafed to us the clouds are welcome, from an artistic point of view, at any rate. In lately looking over a set of instantaneous seascapes taken last autumn on the south coast, I was surprised to find that a cloudless sky was the exception rather than the rule. One more word. Do not lose the opportunity of securing cloud negatives, for they can be obtained on days when other photographic work is next to impossible. At the same time, make a note by compass of the direction in which the camera is pointed, and the hour at which the negative is taken. Similar notes regarding landscape negatives will enable the operator to wed any two without a sacrifice of truth. Thus, supposing, for the sake of illustration, we have a picture of Shakespeare's Cliff, taken at 5 p.m., in August, from the Admiralty Pier, of which it is due west. A westerly sky negative taken in the same month, at the same time, can be associated with it without hesitation. The question of altitude of clouds need not trouble us if the camera be always kept level, and the horizontal line be made to register in both landscape and cloud negatives, as I have already pointed out.

Most instantaneous shutters are so constructed that they will give a much shorter exposure to the sky than to the landscape beneath, and if clouds be present they will be reproduced in the negative in a printable form. A shutter for the express purpose of producing pictures adorned with natural clouds was invented some time back by Mr. Leisk, and is sold, I believe, by Messrs. Marion. But I fancy that it was adapted more for seascape, where there is an unbroken horizontal line, than for more general work. In my own practice, when I am anxious to secure cloud effects I use a shutter which was designed and brought out about twenty-five years back by Mr. Dallmeyer, but which, like

many other things, has been of late years revived and re-introduced, in a slightly altered and perhaps improved form. In its modern dress it is known as Place's shutter, and its chief merits lie in its simplicity, and in the control which the hand can exercise over it during exposure. It consists of a frame having two grooves, in each of which slides an ebonite plate. These plates are connected together by cords which run over a small roller at the top of the contrivance. When one ebonite plate is down in front of the lens, the other is raised in its groove out of the way. By a string attached to this upper plate it is pulled down, and as it descends the other plate rises and the exposure is made. The duration of exposure, and the amount of extra time devoted to the exposure of the foreground, is therefore directly under the control of the hand which pulls the string. I have found it convenient to keep this shutter on my lens during the whole of a day's tramp with the camera, for, as will be evident, it is serviceable for any kind of subject which is likely to be met with, from that which requires a quick exposure, to the many seconds wanted when the camera is beneath the shade of thick foliage.

There is one thing to be guarded against in the use of separate cloud negatives, and that is the tendency to use them for every picture without consideration. In our exhibitions a large proportion of the works hung are often spoilt by being wedded with incongruous clouds, and many amateurs seem to think that if there is only a little patch of open sky it must have a bit of cloud pitchforked into it somehow. This is a mistake. In landscapes containing plenty of subject, and more especially in those in which there is a tracery of foliage against a large portion of the sky, the picture is the better for not being tampered with. A sunlit landscape photograph is very often spoilt by association with a dark cloudy sky through which in nature no sunlight could possibly penetrate. I may mention in concluding this portion of my work, that an excellent article on printing-in clouds in lantern slides from the pen of Mr. Lyonel Clark appeared in the October (1889) number of the *Photographic Quarterly*.

(To be continued.)

Photographic Printing Processes.

No. VII.

By ANDREW PRINGLE.

PRINTING ON "PLAIN" PAPER SALTED.

We have now reached the process which bids fair to be the most popular of all "silver-printing" processes, and there is no doubt that the plain paper has claims on the attention of those who wish to print in silver for pictorial purposes. Albumenised paper has certainly its strong points—a delicacy of detail, a smoothness of surface, and favour with a large mass of the general public. But why the albumen process, with its glossy surface and strange unfamiliar tones—for the tones were unfamiliar when the process was new—held sway so long and so completely, I never could understand. Very few workers until recent years ever seemed to wander away from the beaten track of albumen, but the last year or two has seen a marked change, a very conspicuous waking up to the merits of plain paper. The plain paper process is, of course, older than the other, but we have now reached a very decided *renaissance* of plain paper printing.

It seems to me that if we accept the plain paper as our standard printing process we must also modify our tones, for most of our readers will probably agree that what we

consider the finest tones on albumen paper are anything but fine on plain paper. The circumstances, indeed, are different, for the fact that the image in one case lies in a glossy stratum above the surface of the paper, and in the other case lies in the texture of the paper, makes a great difference in the kind of tone we require. The dark rich warm *purple* tone so much valued in albumen paper looks crude, flat, and dismal on plain paper; the fine details are lost in the fabric of the paper. The warm *brown* tone aimed at by other workers on albumen looks almost offensive on plain paper. But plain paper has browns peculiarly appropriate to itself, and if we can get tones approaching to black we have a great power in our hands for producing prints that will recommend themselves to the artistic eye. I spent a very long time myself in efforts to get really black tones on plain paper, but my efforts were fruitless. I got many tones intermediate between brick-red and very dark brown, tones such as are sometimes shown now as new discoveries, but I never got what I wanted. The fact of the matter is that so long as we begin to tone an image with any redness in it we shall never, so far as I know, be able to tone it to a real black, such as the tone of a good engraving.

The very first matter we have to consider with a view to black tones is the sizing of the paper. It is now pretty generally understood, and my own experiments convinced me that the best size for paper to be salted and silvered is arrowroot; at all events, arrowroot ought to constitute the greater bulk of the size. Iceland moss is sometimes recommended, and I have used it with satisfactory results. The choice of a sizing solution should depend on the kind of paper to be used, an open-grained paper requiring naturally a more viscous (or strong) size. The object, of course, is to prevent the image being entirely lost in the paper. If the size is too thick, the image may be too much on the surface, and there is also an evident difference between the result of floating the paper on the solution and immersing it entirely in the size. Some authorities float, others immerse the paper. If my size is thick, I float or brush on the solution; if thin, I immerse the paper entirely.

Thin Saxe or Rive paper may be floated on one of the following solutions:—

I.				
Gelatine, any pure sample	..	..	20	grs.
Arrowroot	..	..	40	"
Ammonium chloride	..	..	160	"
Water	..	..	20	ozs.
II.				
Gelatine	..	..	20	grs.
Ammonium chloride	..	..	60	"
Water	..	..	20	ozs.
(Hardwick).				
III.				
Sodium chloride	..	..	25	parts.
Citric acid	..	..	1	part.
Irish moss	..	..	5	parts.
Gelatine	..	..	2	"
Albumen	..	..	50	"
Water	..	..	200	"
(Schölzig).				

Nos. 1 and 2 will be suitable for the ammonio-nitrate bath. No. 3 will be more suitable for a plain silver nitrate bath. It must be understood that paper ready sized and often suitably sized can be got in the market; for instance, I believe that paper sized and salted as No. 3 can be obtained from Mr. Schölzig. Ready-sensitised plain paper can also be obtained from several sources; Messrs. Watson and Sons, High Holborn, keep it in stock, also I believe Mr. Schölzig. I have myself used paper from both these

sources, and both brands of paper gave me good results. And Mr. Lyonel Clark has lately given instructions for salting and sensitising plain paper. As Mr. Clark's experiments have so lately appeared in the photographic papers, and as I have not yet found time to repeat the experiments, I do not propose to reiterate what has already been so well said on this particular subject.

But if the reader proposes to sensitise his own paper, he may use a 60 grs. nitrate of silver bath (silver nitrate 60 grs., distilled water 1 oz.), or better, in most cases, especially for black tones, he may use the Hardwick formula for ammonio-nitrate thus: Dissolve the full quantity of silver required in one-half the total quantity of distilled water. Then drop in very slowly, stirring all the time, strong liquor ammonia. At first a brown precipitate will be formed, but after further addition of ammonia the precipitate will begin to be redissolved, and at last a point will be reached when the whole of the precipitate is just redissolved; after this a crystal of silver nitrate may be added, or a few drops of a solution of silver nitrate till there is a very slight cloudiness. Then add distilled water to the required measure. Or the method quoted by Mr. Lyonel Clark may be adopted, or lastly, nitric acid may be added to the bath prepared by Hardwick's process till the alkalinity of the original is considerably lessened, or nearly neutralised. So far as result is concerned, I cannot pretend to have detected any notable difference between these processes, but in keeping quality of the paper there will be found a great difference. The more alkaline, the bath is, the less time the paper will keep. Paper sensitised on the plain ammonio-nitrate bath will not keep for a day; the addition of nitric acid improves the keeping qualities in proportion, perhaps direct, to the quantity of acid added. If the paper after being floated on the plain silver nitrate bath be floated on a 10 per cent. solution of citric acid, the paper will keep for a long time, but I fear the tones will not be improved, certainly the black tones will be more difficult to obtain.

The ammonio-nitrate solutions should be applied to the paper with a glass rod; pour a pool of the solution on the centre of the sheet to be sensitised, then as rapidly as convenient spread the solution equally over the paper with the rod. If we float our paper on an ammonio-nitrate bath, the bath will very soon become useless.

Before proceeding to the question of toning, I wish to say that so far as my somewhat extensive experience of this process goes, I do not find that the process of sensitising makes any notable difference in the results. I find I get practically the same tones on Watson's and Schölzig's paper as I used to get on my own. And Mr. Clark's tones, though produced by a process I never tried, simply reminded me of my own efforts of past years, so far as appearance goes; Mr. Clark's results may be more permanent than mine. There is no doubt that the process of that gentleman deserves study. I am at present trying a process of toning new to me, but not in any way originating with me; it promises well, and I hope to give some account of it in my chapter on toning plain paper.

(To be continued.)

MESSRS. HINTON AND Co. have introduced a novelty which will be welcomed by all lantern-slide makers. This is a perfectly colourless limpid varnish which can be applied to the film without the aid of heat at any stage of the process. The gelatine men will welcome this innovation as a means of protecting their work against the effects of damp and mildew, and the wet plate and collodio-bromide workers will find the value of a medium which will so effectually protect their tender films from mechanical injury.

Competitive Papers.—No. XII.

ENLARGEMENTS.

First Prize—REV. T. PERKINS.

The general principles upon which the possibility of making enlargements depends can be best explained by considering the case of a convergent lens in its simplest form, namely, a double convex lens made of a single piece of glass with surfaces of equal curvature, such as is represented in the first figure.

Let AB be the lens, C its centre, PQ an object in front of it emitting or reflecting light. Let PA, PB be two rays proceeding from P and passing through the top and the bottom of the lens; these after refraction by the lens will converge to a point P', such that P, C, and P' will all be on the same straight line. An image of P will then be formed at P'; similar rays proceeding from various points in the object PQ will converge to various points along P'Q', so that an image of the whole object PQ will be formed at P'Q'. It is evident from the figure that the height of the object and its image will be proportional to CR and CR', their respective distances from the optical centre of the lens. It is found that as PQ is moved nearer to the lens, P'Q' moves further away from it, and as PQ moves away from it P'Q' moves nearer to it, until when PQ is so far off that the rays PA and PB are practically parallel, the point R' moves up to a certain point F', which is called the principal focus of the lens; a point F situated on the axis on the other side of the lens, so that CF is equal to CF'

FIG 1.

is also called the principal focus. R and R' are called conjugate foci. If the object PQ were placed between F and C, the rays after refraction by the lens would no longer converge, and consequently no image would be formed, but as long as CR is greater than CF, a real image will be formed on a screen suitably placed behind the lens.

It is found that the positions of the conjugate foci are connected by the following relation.

$$\frac{1}{CR} + \frac{1}{CR'} = \frac{1}{CF}.$$

If we denote CR by u , CR' by u' , and CF by f , the formula may be written:

$$\frac{1}{u} + \frac{1}{u'} = \frac{1}{f}.$$

When a view is being taken, u is considerable compared with f and u' , consequently the image is small compared with the object; but when u is made equal to $2f$ the formula shows that u' will also be equal to $2f$, and consequently the image will be equal in size to the object.

If, therefore, a negative is placed in front of a lens attached to a camera, such that the front remains fixed in position, and the focussing is done at the back, we shall, if the distance of the negative from the lens exceeds twice the focal length, get a reduced image on the ground-glass, and the image will increase in size as the negative is moved nearer to the lens if the focussing screen is

drawn away from it so as to keep the image always sharp. When the distance of the negative from the lens is equal to twice the focal length, the image will be the same size as the object, and if the negative is moved nearer we shall get an enlarged image, provided that we move our focussing screen back so that the image on it remains sharp. If we wish to form an image n times the size of the object, we shall have to make u' equal to nu , and the formula will take the form

$$\frac{1}{u} + \frac{1}{nu} = \frac{1}{f},$$

from which it follows that $u = \frac{(n+1)f}{n}$. This shows that CR

must always be greater than CF, as previously stated.

If it is required, for instance, to enlarge a quarter-plate negative up to whole-plate size, which is twice as long and twice as broad, 2 must be substituted for n , and the proper distance in front of the optical centre of the lens to place the negative is

$\frac{3f}{2}$. All then that theoretically is required for enlarging is some arrangement by which the lens may be fixed, and the negative can be placed in any desired position with its plane perpendicular to the axis of the lens, and the sensitive medium on which the enlargement is to be made may be shifted nearer to or further from the lens until sharpness is obtained, and then held firmly in position with its plane perpendicular to the axis of the lens. It is, of course, absolutely necessary that no light should fall on the sensitive medium, save that which comes through the lens, and it is desirable that as little light as possible, save that which comes through the negative, should pass through the lens. Arrangements more or less complicated for securing these necessary conditions are used, but before describing any of them it will be well to say a few words about the lens used in copying. Any lens that has a sufficiently wide angle to embrace the negative to be enlarged when in the desired position will give an enlargement, but it by no means follows that all lenses will give equally good ones, even though the lenses themselves be good. What is required is equality of illumination, great flatness of field, and entire absence of distortion. Depth of focus is of no importance; what we require is a lens that will represent a flat object on a flat field. Single lenses must be rejected, on account of their curved fields and distortion of straight lines; and a doublet must not be used so as to embrace a wide angle, otherwise we shall not get equality of illumination. Perhaps the best lens that can be used for the purpose is one of Dallmeyer's triplets, the focal length of which is about twice the length of the negative to be copied, with the tube reversed so that the larger lens is towards the negative; but if such a lens is not at hand, a rapid rectilinear of the same focus may be employed, and as with this the two lenses are symmetrical, no reversing of the tube is required; a lens of the same focus as that with which the original negative was taken is, theoretically the best. But as increased length of focus in the lens necessitates a greater distance between the negative and the sensitive medium, we may sometimes be compelled by want of room to use a lens of shorter focus than we otherwise should employ. In enlarging a quarter-plate negative to whole-plate size, if we use a 4 in. lens the distance of the negative from the lens will be 6 ins., and the distance from the lens to the sensitive medium 12 ins., or 18 ins. in all; while if we use an 8 in. lens the corresponding distances will be 12 and 24 ins., or 3 ft. in all.

The sensitive medium on which enlargements are now most frequently made is bromide paper, but since "Enlargements on Bromide Paper" is the subject of a separate competition, we will confine our description to a method by which an enlarged negative on a glass plate or film may be made, from which positives may be printed by any of the usual processes.

There are two ways in which this negative may be produced—

(1) A positive transparency may be made from the original small negative by contact printing, and from this transparency an enlarged negative may be made; or (2) An enlarged transparency may be made from the original negative, and from this a negative may be obtained by contact printing. Each method has its advantages. The first requires only one large plate, an advantage on economical grounds, yet it has the disadvantage that any accidental defects on the plate on which the transparency is made are enlarged, as well as those due to flaws on the original negative, whereas if we employ the second method only those defects that are on the original negative are enlarged, and as plates are

* In mathematical books it is usual to take account of the sign of u and u' , counting them positive if measured in one direction, negative if measured in the other, and when lenses of different forms are discussed it is needful to pay attention to this, but as we are dealing only with convergent lenses so used that the object and image are on different sides of the lens, we may use the formula given in the text.

seldom entirely free from flaws, the second method is on this account the better when circumstances allow it to be employed.

The simplest method of enlarging by daylight is to use a camera. It must be one which focusses at the back, and has a long body; a wooden-bodied one has the advantage of rigidity. When it is desired to lengthen it still further, a rigid box, with a flange at one end to carry the lens, and at the other a slide fitting into the grooves of the camera which usually take the sliding front, may be attached to the front of the camera. The end opposite to the lens must, of course, be removed. The camera should be capable of being screwed firmly in any desired position to a long plank of wood; along the sides of this

FIG. 2.
FRONT VIEW OF BASE BOARD.

should be fitted two strips of wood as shown in fig. 2, with a rebate so as to allow the sliding piece, shown in fig. 3, which holds the negative carrier to be moved nearer to or further from

FIG. 3.
FRONT VIEW OF SLIDING FRAME HOLDING CARRIER.

the lens. The carrier should be provided with springs similar to those used in magic lanterns (see fig. 4), to allow the frame carrying the negative or transparency to be shifted horizontally

FIG. 4.
SIDE VIEW OF SLIDING FRAME HOLDING CARRIER.

or vertically, so that any part of the picture to be copied can be brought opposite to the centre of the lens. A black cloth, supported if necessary on strips of wood, may be thrown over the camera and the top of the negative-holding frame, so as to cut off all light from the lens save that which comes through the picture to be copied. To get even illumination behind the negative or transparency, one of two plans may be adopted. The board may be tilted so that the axis of the lens may be placed at such an angle to the horizontal that no terrestrial objects cut off the light of the sky, or when this is not possible, a looking-glass may be fastened outside the window or to the front of the board, which must then be placed so that its front is outside the window. The board is now used in a horizontal position, and the looking-glass is inclined at an angle of 45° to the vertical, so that it reflects the light of the sky in the neighbourhood of the zenith through the picture in the frame. Care must be taken that the looking-glass is sufficiently large to subtend an angle rather

larger than the lens is used to include. A sheet of white card may be used instead of the looking-glass, but the light reflected by, or, to be more accurate, scattered from it is not so strong as that reflected from the looking-glass. The plate or film on which the enlargement is to be made is exposed in an ordinary dark back in the same way as when a direct negative is taken. It may often be necessary to make a trial exposure to test the quality and intensity of the light; a small plate, the rapidity of which compared with the large one we intend to use is known, will be all that is needed for this.

The method above described has the advantage that it may be employed in any ordinary room without any arrangements for darkening it, a thing which would be necessary if no camera were used. A room with a north aspect is the best, as no direct sunlight should fall upon the negative or positive transparency while it is being copied. Negatives which have plenty of detail and with sharp definition are the best for enlarging; it is well also that they should not be over-dense. The development of the enlarged negative will be conducted much in the same manner as if it were taken direct.

It will probably always be a disputed point as to whether an enlargement from a small negative or a direct large negative produces the more pleasing prints. No doubt it often happens that many small or moderate-sized negatives, which give pleasing prints of their own size, do not bear enlarging, on account of unsuitability of subject or want of sharpness, or from other causes, but the enlarged picture has certain well-marked advantages over large negatives taken direct from nature, for large negatives must be taken with longer-focussed lenses, which possess little depth of focus, so that unless very small stops are used, if the view is one that has objects at various distances, some parts will be much out of focus, while others will probably be sharp; whereas a small negative, taken with a shorter-focussed lens, even if comparatively large stops are used, will be much more uniformly sharp, and this sharpness will be equally softened all over the picture in the enlargement, which, in my opinion, is far more pleasing than when one part of a picture is decidedly sharp and the rest much blurred. Enlargements, at any rate of instantaneous pictures, have an advantage over large ones taken with the same exposure and correspondingly large stops. Moreover, as a matter of convenience in the field, it is an advantage to have only a small camera, half-plate or quarter-plate, to carry, and then to enlarge two and a half or four diameters respectively, rather than to have to carry a camera capable of taking a 16 by 12 negative direct.

Reviews.

The British Journal Photographic Almanac, 1890.

This publication has now been going on for so many years that photographers regard it with much the same feeling as they do the other accessories of Christmas time. It has been gradually growing bigger and bigger, until now it forms a portentous volume of 900 pages. It is only fair to say that two-thirds of the volume are devoted to advertisements, but such a collection represents a valuable encyclopædia of photographic apparatus—which cannot fail to be useful to all workers, both amateur and professional. Its contents are, as usual, very varied, and amongst those things which may prove most useful is a good dodge for making an adjustable vignetter, which has every promise of being most effective and is easily made. Eikonogen and hydroquinone are there in various shades of light, and one begins to wonder, after hearing all that is claimed for the former, whether we shall not soon be able to dispense with the exposure of the plate altogether! There is a good argentic bromide print of Mrs. Stirling (spelt with an *e*, by the way), and there are also specimen prints of photo-etching on glass, and of photo-mezzotype, both good of their kind. Mr. Dallmeyer gives a very simple method of arriving at the focus of a lens, and Major Nott gives timely hints on the manipulation of stripping films, whilst Mr. William Ouin makes the suggestion of an Institute of Photography, which subject, however, was dealt with in our columns some considerable time ago. Generally speaking, the articles are of interest to the photographer, and there are many hints which will be found useful, not only to the amateur, but also to the professional worker.

Our Contemporaries at Home and Abroad.

At, in its January number, gives the first of a series of articles on "Photography," dealing with it from both a theoretical and practical point of view. The articles are by Mr. Walter E. Woodbury, whose acquaintance with his subject is sufficient guarantee that the papers will be all that could be desired. The magazine also contains serial stories by G. Manville Fenn and Alice Price, and other interesting and useful matter.

The *American Journal of Photography*, in an article on "Photographic Theorising," says:—"The old conflict of theory *versus* practice is seen every day in an art like photography. We constantly meet with photographers who make excellent work, and yet are so ignorant of the principles involved in the production of the said work, that it seems wonderful they should be favoured with so fair a share of success. And it is no less wonderful, on the other hand, that men who have been blessed with every opportunity of acquiring a fine scientific education, should so often be wanting when they take up an art as practical in its nature as photography." There is a charming picture of a child posed as a statue, and other articles on "Photographing the Baby," "Fading of Silver Prints," "Brilliant Prints," "A New Developer," etc.

The *Journal of Microscopy and Natural Science* contains a series of reproductions of photo-micrographic subjects, with descriptive letterpress of a most instructive and interesting character. It quotes the following:—"M. Duchesnes, writing in the *Bulletin* of the French Photographic Society, very emphatically insists on the desirability of the microscopical student making use of photography in his work, and points out how well suited certain diatoms are for first trials in micro-photography. He especially refers to the siliceous skeleton of *Amphipleura pellucida* as an example of a diatom having remarkably delicate structure, and serving well as a test-object to measure the success of photographic illustrations."

The *British Journal of Photography*, in an article on "Salted Paper Redivivus," says:—"It will be seen that the conditions under which the old pictures were produced differ widely from those existing under the more modern system of working, and this will fully account for the difference in the results obtained. If there were really any 'lost art' in making matt-surface silver prints, it must be sought for in the conditions under which they were produced, and not in mere formulæ." Other articles are on "Plate Etching," "New Benzoline Limelight," "Coloured *au Naturel*," "Actions of Mercury on Glass," and "Action of Light on Silver Chloride."

L'Amateur Photographie (Paris) announces a prize competition for negatives of all kinds, the cut-sizes of the plates being 9 by 12, and 18 by 24. It also contains the programme of a series of lessons on "Photography and its Application to Various Industries," to be given by M. Ch. Gravier, which will include lessons on the various reproducing processes, enlargement, reduction, and colouring, and upon which notes will be given in the paper.

The *Magic Lantern* has the following:—"At a recent lantern entertainment given at New York, the audience were shown a slide which was of a particularly interesting character. While the meeting was in process, a flash light picture was taken of the audience, which, after its development, and a transparency made from it, was projected on the screen in a short space of time, much to the delight of the audience." It also contains articles on the "Opaque Lantern," "New Limelight," "Lantern-Slide Mounting," "Lantern-Slides and Slide Making," etc.

The *Naturalists' Record*, a very interesting little periodical, devotes some space to photography, and under that heading says:—"We are very pleased to notice that through the unwearied efforts of the Editors of the AMATEUR PHOTOGRAPHER the establishment of a Photographic Institute will shortly be 'the talk of the town.' The matter has made so much progress that ere we reach January, 1891, 'The Photographic Institute' will be really established in all probability." It also announces that in its next issue will appear "Hints on Photography for Naturalists," by Dr. Emerson.

The *Photographic Art Journal*, we are pleased to see, is waking up, and puts forward a programme for the New Year, which, if

carried out in its entirety, will make the paper one of the most interesting photographic publications of the day. In the introduction to the new volume it says:—"Holding firmly to our announced profession of devotion to the 'interests of Photography as a Fine Art,' we give prominence to such contributions and articles as have to do particularly with its artistic aspect; and this with the avoidance of embittered controversy, which has of late done so much to cast ridicule upon interesting and important matter discussed in photographic circles." Other articles are on "Accessories," "Halation," "Instantaneous or Time Exposures for Figure in Landscape," "Lyonel Clark's Platinum Toning Process," etc. The two illustrations of the North West from water-colour drawings are hardly up to the standard of an art journal, and we might suggest that in a monthly the articles should be as complete as possible.

The *Photographic News* in its first article, dealing with matters "Prospective and Retrospective," says:—"An outcome of such intercommunication is the discovery that a wide-spread desire exists for practical instruction in the photo-mechanical processes, and suggests that the time has arrived when classes for the practice of Collotype, Woodburytype, etc., might very well be formed in one or more of our technical institutes." Other articles are on "Photographic Tourists' Baggage," "Intensifying Collodion Negatives with Hydroquinone," "Lewis Morris Rutherford," "Ornamental Printing in Photography," "Photographing Winter Scenes," "Oscar Gustav Rejlander," etc. The number also contains a copious index to the last volume.

The *Photographic Review* in an article on "Stereoscopic Photography," says:—"Another great, if not fatal, hindrance to the continuance of a reinstatement of portrait stereoscopic photography, was the introduction of the practice of retouching. The stereoscope is in some sense an instrument of precision, and may be used as such to distinguish trifling differences between two otherwise similar drawings or other designs. A spot or other small marking which may pass unnoticed in a single picture, becomes evident when another picture, similar in all respects but the mark in question, is put beside it, and the two images are, by means of the stereoscope, superposed to the observation of the spectator." There are other articles on "Practical Experience as to Magnesium Lighting," "Argentometers," "Mountants," etc.

Photographic Scraps contains an article on "Enlargement," and says, amongst the scraps:—"It is becoming understood by photographers of all grades that technical excellence of negatives standing by itself is of little avail; it is only when this technical excellence is combined with artistic merit that a good picture results; and of the two requisite qualities, perhaps artistic merit is the most essential."

Photography, in a letter on "Softness in Photography," by Fred H. Evans, concludes with the following extract from "Sylvie and Bruno," by Lewis Carroll, an old amateur. The scene is a picnic at an old ruin, a would-be art critic is boring the company with his platitudes:—

"'Do you observe' (such was the phrase with which the wretch began each sentence), 'Do you observe where those trees slope down the hill' (indicating them with a sweep of the hand, and with all the patronising air of a man who has himself arranged the landscape), 'how the mists rising from the river fill up exactly those intervals where we need indistinctness for artistic effect? Here, in the foreground, a few clear touches are not amiss; but a back-ground without mist, you know! It is simply barbarous! Yes, we need indistinctness!'"

"The orator looked so pointedly at me as he uttered these words that I felt bound to reply by murmuring something to the effect that I hardly felt the need myself, and that I enjoyed looking at a thing better when I could see it."

"Quite so," the great man sharply took me up. "From your point of view, that is correctly put. But for anyone who has a soul for Art such a view is preposterous. Nature is one thing; Art is another. Nature shows us the world as it is; but Art—as a Latin author tells us—Art, you know—the words have escaped my memory—"

"Ars est celare Naturam," Arthur interposed with a delightful promptitude.

"Quite so," the orator replied with an air of relief. "I thank you. Ars est celare Naturam—but that isn't it!" And for a few peaceful moments the orator brooded frowningly over the quotation."

There are also articles on "Shutters," "Darkness in Skies in a Photograph, and How to Measure It," "Photographs Sent by Telegraph," etc.

Wilson's Photographic Magazine (New York) has a frontispiece of nine small phototypes of mayors of Philadelphia since the Consolidation (1854 to 1887), and also a good reproduction of an interior. In its New Year article, our contemporary says, and we re-echo the sentiment:—"Every one of our readers—the humble and obscure ones as well as the most prosperous and noted ones—has it in his power to do something for the good

and growth of all the others. Let us all try, then, harder than ever before to make photography honour us and help us one and all. Let us have a care too, that it does not outgrow and get beyond any of us." The Magazine also contains a large number of interesting and useful articles, including, "How to find the Focal Length of a Lens," "Hints for the Printer," "On Bromide Enlarging," "Single Chapters on Practical Photo Chemistry," and "Enlarging Processes."

The *Studio* (New York) enters on a new series with the December number, and is a most interesting and admirably got-up magazine. It contains a splendid etching of "Venus and Juno," from Barye's Candelabrum, also smaller illustrations of Barye, and his "Lioness," "Candelabrum," "The Sitting Lion of the Tuileries," "Tiger-Devouring Crocodile," and others. There are also a large number of articles on art subjects.

Societies' Meetings.

ABNEY CAMERA CLUB.—At the last meeting of the above Society, held on January 3rd, Mr. Flack gave a paper and demonstration on "Bromide Printing." At the end of a very instructive paper several pictures were exposed and developed, the light employed being the magnesium ribbon, and the developers ferrous-oxalate and hydroquinone. In spite of the lecturer's apparent preference for the latter, the general opinion was that the tone given by iron was the more pleasant of the two. During the evening a series of excellent bromide prints were handed round for inspection. A vote of thanks was moved by Mr. Hibberd, and seconded by Mr. D. W. Hill. The Hon. Sec. announced that on January 17th he had promised to read a paper on the "Chemistry of Photography."

BRIXTON AND CLAPHAM CAMERA CLUB.—On Friday, 3rd inst., the President (Mr. A. R. Dresser) gave a New Year's address to the members, advising them on the choice of apparatus, materials, and processes. To all except those going in solely for exhibition work, he recommended the purchase of a hand-camera, and the subsequent enlargement of the best pictures. He said that the recent introduction of roller films would obviate the question of plate-changing, without involving the troublesome operations connected with paper negatives. As a practical illustration of his remarks, he showed a number of bromide prints enlarged from hand-camera negatives, which were examined with great interest by those present. He also announced that he would give a prize for lantern slides, the competition to be on somewhat novel lines. The oxy-hydrogen lantern was then brought into requisition, and about 100 slides by Mr. Dresser were passed through, concluding a very pleasant evening's entertainment.

PECKHAM AND EAST DULWICH PHOT. SOC.—This Society, which was established last May, and now numbers over sixty active members, held its first annual exhibition and competition at Shawbury Hall, on Friday, the 3rd inst. The result of the Members' Competition was announced by Mr. Edwards (President of the Society), who remarked that owing to the excellence of the work the judges' task had been a difficult one. However, after careful consideration the silver medal had been awarded to Mr. Kelly, who was to be congratulated on his success. The next gentleman to receive honours was Mr. Rice; but he would mention with reference to the second and third prizes that the judges were quite at a loss on whom to confer them. They had, therefore, decided to grant another medal, which would be given to Mr. Dowling, who was one of the hardest-working members. Being a young society, they could not award all medals, but certificates would be conferred upon Mr. Kirby and Mr. Boydell, who was one of the youngest and most energetic members of the Society, and fully deserved the honour. The medals and certificates were presented to the fortunate recipients by Mrs. Horace Banks. An excellent lantern exhibition followed, when, owing to the uniform excellence of the slides exhibited, the judges decided to withhold the presentation of the contemplated certificates. Special mention should be made of a good exhibition of platinotype work, kindly lent by the President, Mr. Edwards.

SOUTHEAST AM. PHOT. SOC.—At a special meeting on Friday, January 3rd, the President, Captain T. Lamb, read a paper on a "Photographic Tour in Germany." Numerous views of the principal places of interest in Berlin, Dresden, Leipzig, Magdeburg, and Brunswick were shown on the screen. The most curious

objects in the street views were the "dog-carts" and "advertisement columns," whilst the chimney sweeps were noticeable for their "chimney-pot" hats. All the views were taken with a hand-camera on celluloid films. Captain Lamb was unable to get lantern plates anywhere in Germany, neither could he find such a thing as an optical lantern in any of the towns he visited. He found no difficulty in passing the Customs. At the close of the meeting Captain Lamb bid good-bye to the members, as his regiment was leaving in a few days for the Channel Islands. He trusted that the members would take up the photographic survey of Portsmouth with energy, and presented the society with a splendid album for mounting the prints. Mr. Fisher proposed, and the Hon. Secretary seconded, a vote of thanks to Captain Lamb for the deep interest he had taken in the society, and the valuable aid he had given in its formation, and also for the handsome album he had just presented. This was carried unanimously amidst general expressions of regret at the loss the society would sustain by his departure.

WEST SURREY AM. PHOT. SOC.—A meeting was held on the 1st inst. at Crichton Hall, Clapham Junction. The rules for the new library were approved, and the question of the second exhibition discussed and referred to the Committee. The evening was devoted to an exhibition of lantern slides, several of which were of an amusing nature. The Editors of the *AMATEUR PHOTOGRAPHER* kindly lent a parcel of about fifty, and they were much appreciated and admired. Mr. Davison also had a large parcel. The next meeting will be on the 15th inst.

A PHOTOGRAPHIC SOCIETY FOR LOUTH AND DISTRICT.

A DRAWING-ROOM meeting of the amateur photographers of Louth and district was held at the residence of Mr. S. F. Clarke, Ugate, on Friday last, to consider the advisability of forming a local photographic society.

Captain Ranshaw, who was in the chair, showed some very fine photographs by Mr. J. Gale, also some reproductions of that gentleman's most famous pictures.

There was also on view a large collection of over 400 photographs kindly lent for the occasion by the Editors of the *AMATEUR PHOTOGRAPHER*, including pictures to which prizes had been awarded in various competitions, landscapes, seascapes, views in the hayfield, pictures of animal life, etc.

Mr. Clarke exhibited photo-micrographs by which he secured a diploma at Vienna, and some duplicates of his lantern slides that won the gold and silver medals at the recent exhibition at Coventry.

On the motion of the Rev. C. W. Whisler, seconded by Mr. E. Hall, it was decided to form a photographic society for the district. A committee was formed to draft rules and to take necessary steps. The proceedings closed with a vote of thanks to the Chairman, to Mrs. and Mr. Clarke, and to the Editors of the *AMATEUR PHOTOGRAPHER* for their kindness in sending down the interesting collection of photographs on view.

Mr. Clarke was appointed Hon. Sec. *pro tem.*, and will be pleased to answer any inquiries from those in the district interested in the movement.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

THURSDAY, January 2nd, was a lantern evening, and there was a large attendance of members.

The chief part of the exhibition consisted of a selection from a number of slides kindly lent by the Birmingham Photographic Society. After these, other slides were shown by Mr. T. Charters White, general landscape and microscopic; Mr. Frank Howard, landscape and landscape with figure; Mr. Rooper Leventhorpe, pictures taken in North Italy; Rev. C. F. Fison, English country scenes; Mr. F. Howlett, a series of views on the Thames; and in conclusion a set by Mr. J. B. B. Wellington, of landscape and landscape with figure, etc. Some of Mr. Wellington's slides were especially effective and attracted much attention.

The subject for Thursday, January 16th, is "Plane Polarization of Light," when an address will be given by Mr. R. Tindall. The lecture will be illustrated. Meeting at 8 p.m.

Exhibitions.

KEIGHLEY PHOTOGRAPHIC EXHIBITION AWARDS.

PROFESSIONALS.

Landscape or Seascape—Silver medal, Lyd. Sawyer; bronze medal, J. P. Gibson; certificate, James E. Gould.

Subject Pictures—Silver medal, H. P. Robinson; bronze medal, E. W. Sutcliffe; certificate, Mr. and Mrs. Auckorn.

Architectural and Interiors—Silver medal, W. E. Henry; bronze medal, Thomas Scotton; certificate, R. W. Robinson.

Enlargements—Silver medal, J. N. Edwards; bronze medal, J. A. Faulks; certificate, J. A. Faulks.

Portraiture—Silver medal, W. W. Winter; bronze medal, W. J. Byrne; certificate, E. Greaves.

Lantern Transparencies—Silver medal, G. W. Wilson and Co.; certificate, Dew and Co.

AMATEURS.

Landscape or Seascape—Silver medal, Alex. Keighley; bronze medal, Ernest Beck; certificate, Jno. E. Austin.

Subject Pictures—Silver medal, Alex. Keighley; bronze medal, Jno. E. Austin; certificate, J. W. R. Brocklebank.

Architectural and Interior—Silver medal, W. H. Banks; bronze medal, C. C. Cole; certificate, Rev. T. Melloley.

Enlargements—Silver medal, Thos. J. Bright; bronze medal, A. R. Dresser; certificate, H. D. Arnott.

Portraiture—Silver medal, Mrs. G. Young; bronze medal, A. R. Dresser; certificate, Clarisse Miles.

Lantern Transparencies—Silver medal, E. G. Lee; bronze medal, A. R. Dresser; certificate, Ernest Beck.

GENERAL.

Mechanical—Silver medal, F. W. Edwards; bronze medal, T. Scotton; certificate, J. W. Darling.

Scientific—Bronze medal, E. T. Shelton; certificate, Fred. Riley.

Champion—Silver medal, F. W. Sutcliffe; bronze medal, W. W. Winter; certificate, R. W. Robinson.

The *Photography* Prize—Silver medal, W. W. Winter; bronze medal, Lyd. Sawyer.

The *AMATEUR PHOTOGRAPHER* prize—Silver medal, A. Keighley; bronze medal, T. J. Bright.

The Institute Prize—Silver medal, Thomas Heaps.

The Photographic Association Prize—First grade, Alex. Keighley; second grade, Rev. T. Melloley; third grade, J. W. Darling.

Mr. C. H. Bothamley, F.I.C., F.C.S., adjudicated in the scientific class, Mr. Charles W. Hastings being retained for all the other classes.

THE FORTH BRIDGE.—Messrs. G. W. Wilson and Co., of Aberdeen, have just published a short lecture on the Forth Bridge, which is to be illustrated by a series of twelve lantern slides, showing longitudinal section, tableau of principle, cross section at pier, skeleton plan, showing taper, caissons floating out, foundations, Queensferry, cantilever, upright part, mode of building out cantilever, progress of work, end of shore cantilever, approach viaducts, and bridge completed. The lecture is in very interesting form, and will give the audience a good conception of the magnitude and progress of the undertaking, and will help to emphasise the fact, which of late years has been doubted in some quarters, that British engineers are yet hard to be beaten.

Miscellaneous Items.

A CORRESPONDENT writes complaining that negatives sent to an exchange club, formed by Mr. J. F. Hardy, of West Hartlepool, have not been returned.

HASTINGS AND ST. LEONARDS PHOT. SOC.—This society announces its annual meeting for the 13th inst., when a paper, with illustrations, on the "Limelight" will be read by Mr. A. K. Dresser.

ILFORD PLATES AT BLACKPOOL.—Mr. J. Jackson writes, with reference to answer 2990, in the issue of September 13th, that he has been for seventeen years supplying all kinds of photographic goods.

THE *Phonetic Journal*.—We have received the first number of the new volume of this journal. It maintains its character for interest and clearness, and must be of great use to young photographers.

MESSRS. MCGHIE AND CO., of Glasgow, have sent us a charmingly got-up almanac. The card to which the monthly slips are attached is embellished with a print from a fine steel engraving of a yacht in full sail.

"HOMEWARD BOUND" is the title of a charming print (7½ by 5) of a yacht sailing up the Humber, with Hull in the dim distance. The picture is tastefully mounted, and at the back are appropriate lines. It comes with the season's greeting from Mr. J. Campbell-Thompson, and is a pleasant innovation on the old style of New Year's Cards.

SUTHERLAND PHOT. ASSOC.—In regard to the competition recently held by the members of this association, the judge, Mr. J. Haswell, D.C.L., has announced that he did not consider any of the pictures sent in of sufficient merit to be awarded the medal offered by the Editors of the *AMATEUR PHOTOGRAPHER*. The medals, silver and bronze, are again placed at the disposal of the Association, and will be competed for at a later date.

MR. TYLAR has added another to his long list of photographic "notions," in the production of a medium for backing plates to prevent halation. The plates are laid, film side down, on a sheet of tissue paper, and the medium is applied with a dabber, which forms part of the apparatus supplied. The medium is of such a nature that it can be easily removed by a warm sponge just before development.

MESSRS. TALBOT AND EAMER advise us that they are about to introduce a new quarter-plate hand-camera, constructed on a somewhat similar principle to the "Diamond" hand-camera, and which will possess the following advantages:—Size, 4½ by 5 by 8. No double chamber, consequently small and light. Purchaser's own lens can be fitted, as to an ordinary camera. Holds one dozen plates, which when exposed can be replaced by another dozen in open daylight. Fitted with Thornton-Pickard shutter.

MR. C. C. VEYERS, of Leeds, has sent us a sample of his shilling magnesium flash pistol, which is of very ingenious design. As will be seen by the annexed cut, it consists of a wire frame,

spring, and cast the contents of the box into the fiery furnace in front, the said furnace being a wire-wove plate soaked in methylated spirit. The design is most ingenious and effective for the purpose intended.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.

2. Write each Query or answer on a separate sheet of paper.

3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editors do not undertake to answer questions by post.

6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3351. **Spotted Prints.**—Can you or any brother photographer give me the reason and a remedy for the above? When I take my prints out of the frame they are stuck to the negative.—W. H. R.

3352. **Detective Camera.**—As I am thinking of making a half-plate detective camera, I should be greatly obliged if some of the readers of the **AMATEUR PHOTOGRAPHER** would tell me of a good lens for the same. Would a wide-angle lens be best? Exact focus and price would greatly oblige.—G. K. I.

3353. **Magnesium for Enlarging.**—In trying to use a magnesium ribbon hand-lamp in an enlarging lantern, the ribbon, as soon as lighted, runs into a sort of bulb, of varying length, out of the axis of the condensers, which prevents an even white illumination of the field. Has any fellow-enlarger found this difficulty; and is it remediable by using any other form of same illuminant?—FRED DAVIS.

3354. **Honeycomb Frilling.**—Can any of your readers give the reason why three of my Ilford dry-plates frilled up like honeycomb on being placed in cold water after fixing?—JOHN H. MONTAGU.

3355. **Gelatine.**—What renders gelatine insoluble besides bichromate of potassium and alum? Would readers give a reliable formula?—ANON.

3356. **Lancaster's Special.**—Is Lancaster's 12 by 10 Special patent 1886 camera reliable for hard work?—ANON.

3357. **Exhibition Matters.**—Would some of your numerous exhibitors kindly let fellow-readers know particulars on the following:—Silver prints, etc., for exhibition: Are they as a rule mounted; if so, on what kind of mounts and frames; are more than one 12 by 10 or whole-plate put in a frame, and is there glass placed in front, and what distance from the prints; if they are unmounted, what is a good background? Any other hints would be welcomed by many who have never seen an exhibition, as well as.—IDRS.

3358. **Cheap Plates.**—Perhaps "Country Cousin" will let us know where he can get the cheap plates he speaks about in last week's number, page 6, as no doubt they would be welcomed by many besides.—IDRS.

3359. **Fancy Bazaar.**—Would selling my photographs at a bazaar for church restoration disqualify my exhibiting at prize competitions as an amateur?—X. Y. Z.

3360. **Covering Power of Lens.**—I have a whole-plate lens which will cover a whole-plate at 6 ft. from sitter, but if used at about 30 ft. from sitter, it will cover little more than half-plate, cutting off so much of the corners of the plate or field. What is the cause, and how can I remedy it?—D. B. B.

3361. **Silver-Ring Rectigraph Lens.**—I want a first-class R.R. lens. Can any readers give me their opinion of Lancaster's whole-plate Silver-ring Rapid Rectigraph lens?—ADVANCED.

3362. **Ten Per Cent. Solution.**—Will Mr. Lyonel Clark kindly give me the exact proportions for a 10 per cent. solution of pyro, using distilled water, as I cannot quite understand his formula as given in issue of 6th December? Should sulphate of soda and sulphurous acid be used with distilled water, or would it be better to do so?—PYROGALLOL.

3363. **Negative Varnish Formula.**—Can anyone kindly give a reliable formula for a varnish for gelatine negatives, that will withstand the rain if left

out for a night, and at the same time is tough and durable?—G. B.

3364. **Pizzighelli Paper Staining Plate.**—When printing the other day, using Pizzighelli platinum paper, the paper got wet whilst in the printing frame, and was stained; it also stained the negative, which was pitted all over where the paper had got wet. Could anyone kindly inform me how to remedy the above, so as to restore the negative to the same condition as before? I may add the negative was not varnished, but I found the same thing happened when the negative was varnished. If any solution is recommended, kindly state whether it tends to reduce the negative or not. I soaked the negative in water, which made the pitted places less deep, but they still remain.—AMATEUR.

3365. **Water Condenser.**—Will any correspondent kindly tell me where concave glasses (clock faces) suitable for water condensers can be obtained? Also any information on the making of water condensing lenses will be thankfully received.—FESTINA LENTE.

3366. **Loan of Negatives.**—Will any friend lend me a few quarter-plate negatives for making lantern slides from. I intend giving free entertainments to the poor operatives here in Lancashire. Any negative views, such as these people have no chance of visiting would be very acceptable.—Squizz.

3367. **Jefferies' Patent Washer.**—I find that in the above the prints stick to the outlet. I should be much obliged if someone will kindly tell me if this can be avoided, and if so, how?—W. HALL.

QUERIES UNANSWERED.

Dec. 6th.—Nos. 3274, 3277, 3283, 3284, 3286, 3289, 3290, 3291, 3293.

13th.—Nos. 3297, 3298, 3300, 3302, 3304, 3305, 3306, 3307, 3312, 3314.

20th.—Nos. 3318, 3319, 3321, 3324, 3325.

27th.—Nos. 3329, 3330, 3332.

Jan. 3rd.—Nos. 3339, 3341, 3347, 3348.

ANSWERS.

3334. **Obnetter Paper.**—This querist seems to have got into a muddle all round, and all because he will try to use the same solutions over and over again. Surely if a thing is worth doing well, it is worth while to mix up fresh solutions. Kaolin is generally used for carrying down impurities in silver baths, and not for other purposes. Pictures will lie flat if mounted with the spirit medium sold for the purpose.—HELPSFUL.

3335. **Intensifier.**—Never having used Edwards' developer, I cannot definitely assure you about the matter; but no objection to its use in connection with the intensifier presents itself to me. As to quantity, I meant by 3 minims of sulpho-pyrogallol 3 grs. of pyro dissolved in 30 minims of water, with a certain weight (say 12 grs.) of sulphate of soda as a preservative. If you have worked out how many grains per ounce the strength of your pyro solution is, take the equivalent of 3 grs., and add this to the silver solution. But remember by this means you are considerably diluting its strength.—RADIATION.

3336. **Spilled Negative.**—"Mephisto" has rejected advice which has often been insisted upon in the columns of "ours," and has paid the penalty. He should have varnished his negative, and it would not have suffered. Perhaps the Platinotype people from whom he obtained the paper can suggest a remedy.—BROMO.

3337. **Lantern Plates.**—Certainly; but if "Lantern" means to coat plates, the following is the method.—Clean glass to be coated well and dry, then place on a levelled board or table. Take

Gelatine (best) 1 oz.

Hot water 20 ozs.

Dissolve and filter; then coat glass at a temperature of 130 degs. Fahr. (not too thickly), allow gelatine to set, and when set place vertically to dry in a place free from dust. When dry, sensitise with the following:—

A.

Iron-ammonia citrate 7½ drms.

Distilled water 4 ozs.

B.

Ferridyranide potass. (red) ... 5 drms.

Distilled water 4 ozs.

Mix A and B in equal proportions, and filter into a dish. The plate or plates are immersed in this solution, face up, for five minutes, always having enough solution to cover plates well; then take out and place vertically in dark to dry, which drying should by some means be quickened. When dry they are printed on, and treated in the same manner as the paper. N.B.—Sensitising can only be done by gas or lamp light, and a few drops of a ten per cent. solution of potassium bromide to the sensitising bath is an improvement. Only sensitise as many as are required for immediate use. The best subjects for this process are yachts on sea, and water views in general.—SILVER.

3338. **Platinum v. Gold.**—Let this querist read what has recently been done by Mr. Lyonel Clark and others, and refrain from asking such absurd questions. His oiled glass question he should settle by experiment.—L. L.

3340. **Phosphate Bath.**—It is distinctly bad to

make it too alkaline, and if you have made it too much so, dilute it to the proper strength, and add the right quantity of gold, which evidently should have been done at first, instead of making it so alkaline.—RADIATION.

3342. **Zincography.**—A book on this subject has been published. The author's name is Wilkinson.—JACK.

3344. **Lenses.**—Melchior does not give the focal length of his lens tube as he intends using it, nor diameter of tube to hold it, without which it is impossible to answer his question as to cutting off part of view. But if he draws a horizontal line equal to focal length of lens, and using it as a centre, at one end sets off at right angles a line equal to largest dimension of plate used, and at the other a point representing lens centre by ruling lines from lens centre to corners of plate, he has the light ray; and by sketching the diameter of tube in its position he will at once see if rays are cut off or not. As to lengthening exposure, it will not do so any more than if camera was right length.—LINDUM.

3345. **Toning.**—The prints should be deeper toned, perhaps deeper printed, and they will not then lose colour.—B. C.

3346. **Intensification.**—Try negatives in a very strong mercury bath, and, when white, in a strong ammonia bath. To intensify, the plates must always be "perfectly" free from hypo, and after the mercury bath, require to be washed well (under a tap if possible) for twenty minutes at least; then it is best to blacken in a bath of strong ammonia, and again well wash in a current of water. Ilford plates give fine results under this intensification. I cannot speak of other makes, but I have some very delicate negatives that have remained totally unchanged in three years after the mercury and ammonia baths; but well washing means long life.—A. W. GOTTLIEB.

3349. **Photographing Flowers.**—No special form of lens is requisite for this work, about which there is no great difficulty. Certainly, use isochromatic plates.—T. B. K.

3350. **Finder.**—A short focus spectacle lens, a sloping mirror, and a bit of ground glass will make a good finder. Could not this querist make better use of his powers of observation?—JIM CROW.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT:

V.A.—The nearest society is at your own town, and the President is the Rev. T. Perkins, Grammar School, Shaftesbury.

SISTER E.—We should certainly advise you to obtain the two lenses by the maker first named. They can be made to fit the same flange by means of an adapter. Of course, we cannot tell whether your camera will open out long enough for one of these. An alternative plan would be to use the back lens of the R.R. as a single lens well stopped down for distant views. There is no difficulty now in getting the Iris diaphragm fitted to any lens.

R. B.—We were very pleased to look over your pictures, which are very creditable to a worker of such recent standing. The seascape is especially pleasing. We should now advise you to aim at getting artistic figures into your pictures, in order to invest them with greater interest.

SYLVER.—Old plates can never be as good as those which are freshly made, and it is often quite impossible to trace the actual cause of deterioration. The clear spots may be caused by dust, and especially by the kind of dust in a dark-room. We know of no remedy against damp-spoiled plates.

J. E. S.—The maker you name is quite safe to deal with. But we have had no actual experience of this particular lens, nor can we venture to state whether or not it is inferior to those of another maker.

P. W.—We believe that 1 and 2 are the best of those which you name.

W. H. R.—We cannot trace the cause of the spots upon the print which you send. They look as if the negative had by some means been abraded.

ELECTRA.—Our publishers will attend to your requirements. We should not advise you to use the portrait lens for detective work. The "extra rapid," whether half-plate or quarter-plate, should be equal in rapidity.

O. LAMBERT.—Thank you very much: the returned slides received safely. It is kind of you to send us such good wishes.

A. SCOTT.—No stamps were sent with your advertisement, consequently it was not inserted.

J. W. CARPENTER.—Your slides are very fair and are eligible for entry in subject g. See conditions of our "Lantern Slide Competition." You can have the prints back when you like.

C. S. MYERS.—Index will be sent out with next week's issue.

T. M. BROOK.—Your letter is most encouraging. The **QUARTERLY** has been well received, and we anticipate a very large sale.

J. W. MUNRO.—Send us the MS., and we will advise you as to publication.

JAMES FINDLAY.—The lens you name will give the same image and cover a half-plate, using a small stop. Hope your good wishes may all come true.

G. S. BIGLAND.—(a) Send your vote on a post-card; (b) will be inserted next week; (c) see advertisements.

B. M.—Your query should have been sent us as an advertisement to our Sale and Exchange column.

T. O'CONNOR.—Have lost sight of your query.

W. EDDYMAN AND CO.—Buy the PHOTOGRAPHIC SOCIETIES' REPORTER, and write to the secretary of the West London Photographic Society, which would be the best for you to join.

A. G. COBB.—Thank you, but it is very poor looked at from a photographic point.

F. DAVIES.—We have put your letter in our "suggestion" book.

W. P. PITTS.—Very glad the reason has been made plain to you.

H. MACLEAN.—We are very sorry, but on your own showing your work will not be eligible for our "Prize Tour Competition." The conditions have been drawn up with great care to meet the special objects of the Competition, and will be most rigidly adhered to. You should have entered for "Holiday Work," which was quite a go-as-you-please affair.

J. W. HALL.—We cannot give you the information asked. We were asked to select the best of a list, and have done so; this we shall be glad to do for you if you name three or four makers of plates.

J. G. PATTERSON.—Your idea is a good one and shall have our best attention. It has been placed in our "suggestion book." Some weeks must elapse before we can commence another special.

W. CLEMENT WILLIAMS.—We have your two letters, and will write you. Your suggestions are very admirable, and we shall certainly not fail to seriously consider them.

SQUIZZY.—We will help you and loan you some slides. Write us as to date, etc., and the matter shall have attention.

H. G. RICHARDSON.—The iridescent stains are due to chemical fog. Your negatives can be had at any time.

J. A. RANDALL.—At present we cannot meet your views.

LEWIS W. TINDAL.—We shall have much pleasure in framing your photographs contributed to our "Prize Tour Competition."

S. H. B.—They will be ready for return at the end of the month.

W. F.—We have no set of slides specially suited for illustrating a paper on "Hand Cameras." We shall be pleased to let you have fifty slides of the ordinary type. Many thanks for good wishes.

THOS. GILBERTSON.—No. 2 or 4 you will find very good lenses.

J. F. PEASGOOD.—Duly noted.

ALFRED PALENZ.—Cannot trace the receipt of any book by Robert Talbot.

L. C. BARKER.—The developing dish will be advertised very shortly, we understand.

E. LLOYD EDWARDS.—You will be quite safe, we think, in taking the camera with the lens recommended. Both lenses are admirable for the purpose. They are in focus beyond a certain distance. Would not advise you to have the other camera you mention.

ISLEY R. CODMAN.—Sorry not to have you in our competition, but shall hope to upon some other occasion.

MARTIN J. HARDING.—(1) The lantern slides can be made from the negatives certainly. (2) The fact you mention will not debar your entering the competition.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less, and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to *Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill.* A single figure, or group of figures undivided by letter, space, stop, or words, counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to *Hazell, Watson, and Viney, Ltd.* A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to *Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.*

Amateur Photographer.—**AMATEUR PHOTOGRAPHER**, unbound, clean, from November 21st, 1884, to December 23rd, 1889 (numbers missing, October 9th, 1885, and October 8th, 1886). What offers in cash? *M. Clarke's Library, Richmond Road, South Kensington.*

AMATEUR PHOTOGRAPHER, from commencement to date, complete, unbound, indexes, plates, and special numbers, splendid condition; lot for 25s.—*Hedderwick, Hogganfield, Glasgow.*

Amateur Photographer, etc.—**AMATEUR PHOTOGRAPHER**, volumes 3 to 6 bound, and 7 to date unbound; *Photographic News*, bound, 1885; several year-books and other works on photography. What offers? or will exchange for good hand-camera or quarter-plate set.—*Photo, 173, Hemingford Road, Barnsbury.*

Camera.—Good ha'f-plate Instantograph camera, complete, equal to new; three double dark slides; 75s., or exchange for whole-plate, with rectilinear lens.—*60, Load Street, Bewdley.*

Wanted to exchange, full-plate camera (with rising and sliding front, rack and pinion focussing arrangement, bellows body, reversible, new condition) for half-plate, with same arrangements.—*Geo. Howard, 19, Boston Castle Grove, Rotherham.*

Camera with Lens.—Special patent, very portable, light, whole-plate conic camera, complete, rectigraph lens, Iris diaphragm, splendid definition, and threefold field stand; all guaranteed in very good condition, as new; sacrifice £7 10s. Purchasing larger apparatus.—*Porphyrus (address with Publishers).*

Engine.—Model paddle engine, brass boiler; price 35s.—*Burt, 67, Forest Road, Dalston.*

Gas Cylinder.—Gas cylinder, 40 ft., with about 30 ft. of oxygen gas; £2 2s.—*W. Hargreaves, 83, St. James' Street, Burnley.*

Hand-Camera.—Defective camera, by Thistleton, 5 by 4 Beck R.R. lens, with Iris, time and instantaneous shutter working between lenses, finder, six double backs; price £3 6s. Also a Facile. £2 12s. Specimens shown.—*G. R. B., 136, Junction Road, N.*

Lantern Slides.—Several dozen lantern slides, 4s. 6d. per dozen, or will exchange for good hand-camera, or quarter-plate set.—*Photo, 173, Hemingford Road, Barnsbury, N.*

Lenses.—R.R. lens, by Stereoscopic Company, excellent condition, with stops.—£1 ls.—*Laurel Cottage, Heath, Leighton Buzzard.*

7 by 5 Kyrscope rectilinear; cost £4; price £2 19s. Whole-plate rectilinear, 3ls. 6d.; half-plate rectilinear, 2ls. Bargains, half-cost.—*P., 82, Preston New Road, Blackburn.*

Lens with Shutter.—7 by 5 Optimus R.R., as new, £2; with pneumatic shutter, £2 3s. 6d.—*L. S., 41, Waldemar Avenue, Fulham, S.W.*

Organ.—Handsome American organ, 9 sets, 18 stops, 8 ft. 6 ins. high, 29 gold embellish pipes on top; £36. Photograph 4 stamps.—*Burt, 67, Forest Road, Dalston.*

Retouching Desk, etc.—Best make mahogany retouching desk for 12 by 10 to quarter plates; cost 35s.; price 15s. 12 by 10 tripod, best make; cost 42s.; price 18s. 6d. Also a few photographic sundries, cheap.—*Thomson, 31, Lee Terrace, Lee.*

Safety, diamond pattern, unsoiled; list £15, sacrifice £7 10s. Approval, anywhere.—*Potter, 2, Peter's Street, Norwich.*

Studio, etc.—Studio, portable, 15 ft. by 6½ ft., 130 ft. glass; modern half-plate camera, studio stand, tripod, quarter-plate camera, and lens; 120 **AMATEUR PHOTOGRAPHERS**; £10.—*Mason, 5, Pleasant Row, Hyson Green, Nottingham.*

Quarter studio camera, tripod, lens, slide, nine printing frames; price 30s., bargain.—*250, Hornsey Road, Holloway.*

Set.—Quarter studio camera, tripod, slide, lens, nine printing frames; price 30s., bargain.—*Locken, 250, Hornsey Road, Holloway.*

Lancaster's Instantograph, 1889, half-plate, fitted all latest movements and improvements, double extension, reversing back, Instantograph lens and shutter, Iris stops, double dark-slide, quarter-plate carrier, and folding mahogany stand; set complete; approval; 74s.—Cousins, 5, Stanley Villas, Bruce Grove, Tottenham.

15 by 12 camera, two double dark-slides for films or glass, and strong stand, specially useful for enlarging; only £2. Also Lancaster's quarter-plate International, with rapid rectilinear lens, stand, and four double dark-slides; cost £5; sacrifice for price of the lens only, viz., £2, or useful photographic exchange.—*Write V. A. G., 20, Pembroke Road, Kensington.*

Camera, Farnival half-plate, all latest movements, three mahogany double backs, folding tripod, leather and canvas cases, etc.; bargain, £5.—C., 30, Brooke Road, Stoke Newington.

WANTED.

Camera.—Facile or any good detective camera; exchange violin, value 70s., and cash.—*Walter Davies, Newbury.*

Lancaster's half Instantograph, 1889 (no lens or tripod); cheap; approval.—*Stevens, 209, High Street Sheerness.*

Camera, etc.—Half-plate square-bellows camera, by good maker, three or four double backs.—*State price and particulars to James Balmforth, Wellington Street, Batley.*

Hand-Camera.—Hand-camera, perfect.—*Price and sample to Ward, Merton Road, Southsea.*

Lantern Slides.—Good lantern slides and part cash, or otherwise, for handsome 12-air musical box, six bells, price new last year £12.—*Write C., 41, Thornhill Road, N.*

Phot Soc Reporter.—**PHOTOGRAPHIC SOCIETIES REPORTER**, Nos. 1 and 2. State price.—*Samuel Woolley, 75, Victoria Street, Ashton-under-Lyne.*

Set.—Camera, dark-slide, lens, and stand; cheap.—*H. P., Broad Street, Bath.*

PHOTOGRAPHIC QUARTERLY.

Illustrations for future Numbers.

It is intended in the future numbers of the "PHOTOGRAPHIC QUARTERLY" to present Subscribers with a Photogravure of some well-known Photograph. Will the Readers of the "AMATEUR PHOTOGRAPHER" fill up the annexed Coupon, with the Title of Picture and Name of Photographer whose work they consider most suitable for the purpose. The publishers will endeavour to reproduce the Photographs receiving the largest number of votes.

If preferred, Title of Picture and Name of Photographer may be sent on a Post Card, but in any case the Name and Address of the Voter must be given.

The Coupon or Card must be returned on or before Monday, the 13th of January, 1890, addressed to:—

The Editor, "PHOTOGRAPHIC QUARTERLY,"

1, CREED LANE, LUDGATE HILL, LONDON, E.C.

<i>Eighth</i> "	1 1 0	" Certificate.
<i>Ninth</i> "	15 0	" " "
<i>Tenth</i> "	10 6	" " "

All photographs and MSS. must be endorsed "Prize Tour Competition," and addressed to the

Editors, *AMATEUR PHOTOGRAPHER*,
1, Creed Lane,
Ludgate Hill, London, E.C.,

on or before the 28th of February, 1890.

NOTE.—A copy of rules, form of declaration, and competitor's form will be sent on receipt of stamp.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITION.

No. 8.—"ENLARGEMENTS" (January 16th).

Two Silver and Two Bronze Medals.

(All pictures must have attached to them a print from the original negative; they must be mounted, and can be of any subject.)

Entry form forwarded on receipt of stamped and addressed envelope.

Address:—"Monthly Photographic Competition," The Editors, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

Crystal Palace Photographic Exhibition.

MARCH 11th to 29th, 1890.

SPECIAL NOTICE.—ADDITIONAL PRIZES.

In deference to a generally expressed wish, a Special Class will be formed in addition to the published Schedule, and a Silver Medal will be awarded for the best Picture, irrespective of subject, to be selected by the Judges from amongst those Pictures which have never been previously shown at a public Exhibition. Pictures entered for this Prize will be equally eligible for award in their several Classes.

Two Additional Silver Medals

Will be given by Mr. BUCHANAN WOLLASTON and Mr. J. F. PEASGOOD—(A) one by Mr. B. WOLLASTON for the best Picture, irrespective of Class, in the *Amateur Section*; and (B) one by Mr. J. F. PEASGOOD for the best Picture, irrespective of Class, in the *Professional Section*, neither Picture having taken any other award in this Exhibition. The whole of the Exhibitors in the Apparatus Division will be asked to adjudicate upon these Supplementary Awards.

VEYERS' MAGNESIUM FLASH PISTOL. Post Free 1/3

1/- Complete. For taking Instantaneous Photos at Night.

From 3 to 3 grains Magnesium only required.

No blowing or pneumatic arrangement required. Fired same as an ordinary pistol!! Great diffusion of light; absolute certainty in every case. No chance of failure whatever!!! Complete directions with each, or, post free, One Stamp.

Magnesium Powder (of Guaranteed Purity), 1/7 per oz. Postage, etc., 2d.

Nothing breakable. Made entirely of brass and steel. Folds up for carrying in waist-coat pocket!

VEYERS' COLOURED LANTERN SLIDE BINDERS.

Put up in boxes of 100 strips, each sufficient for one slide. Colours: Green, Blue, Pink, Orange, and Lilac. The price—like all Veyers' Specialities—just half that charged for the ordinary black binders. 6d., post free 7d.; in box. 9d.

VOL. XI. No. 276.]

FRIDAY, JANUARY 17, 1890.

[PRICE TWOPENCE.]

◀ OUR VIEWS. ▶

"To hold as 'twere the mirror up to nature."—*Shakespeare*.

A VERY interesting letter is published in another column upon the establishment of a lantern club. The uses of such a club are very numerous, and we should say that Mr. T. H. Holding's suggestions will receive the ready support of many of our readers. We shall be pleased to receive letters upon the subject, and will render the scheme every assistance in our power. It is well known that we hold strong views as to the usefulness of the lantern as a means of giving instruction in an interesting and popular manner.

* * * *

OUR contemporary, *The Queen*, calls attention to the fact that Mrs. Eveleen Myers, sister of Miss Dorothy Tennant, the painter, has turned her attention to the artistic side of photography with great success.

"Mrs. Myers endeavours to bring out the possibilities of beauty in the subject she selects, rather than to produce a faithful likeness of any particular person. Her method is, in short, that of the painter or the sculptor who endeavours from the suggestions which a model affords to create a work of art in accordance with his own ideal. Mrs. Myers, it must be admitted, has been singularly fortunate in her models, and in none more so than the lovely children who form the subjects of several of her finest photographic studies. 'The Little St. John,' representing the lines, 'A young lamb's heart among the full-grown flocks,' is instinct with poetry and charm, as is also a winged head, entitled, 'The Compassionate Cherub.' 'Entering on Life' and 'I am a Monarch of all I Survey' are delightful examples of English childhood in its undaunted courage and innocence. In the last-named picture, the sheen of the child's silken draperies, the texture of the fur, and the modelling of the limbs are all reproduced with more than usual finish. The series also comprises some beautiful girls' heads."

Mrs. Myers also took several photographs of the late Mr. Browning, as well as two of the Rt. Hon. A. J. Balfour, M.P. We quite hope that Mrs. Myers may be induced to contribute to the PHOTOGRAPHIC QUARTERLY.

* * * *

A SUBSCRIBER, a professional photographer, writes us—

"THE PHOTOGRAPHIC QUARTERLY is a step in the right direction, and adds new dignity to photography by raising the status of photographic literature. The illustrations are good, by good processes, which is more than can be said for the usual process-illustrated year-books, etc.

"One very important feature, to my thinking, in your new venture is the portraits of men who have done good work for photography as a science and an art, and there is no doubt that you will earn the gratitude of all intelligent photographers, by continuing to issue in a *permanent* and detached form these portraits. It is a shame to our societies and clubs that no attempt (that I am aware of) has ever been made to form an historical collection of photographic celebrities."

Such a letter is exceedingly gratifying to the conductors of the QUARTERLY, and the suggestion held out will not be lost sight of.

* * * *

WITH regard to the "popular vote," we must admit that the number of coupons received has not been so great as we should have thought. Next week we shall publish the order of the six pictures which have received the largest number of votes, and shall communicate with the artists whose names are mentioned, and ask their permission to reproduce the photographs. Each one will be a frontispiece, and will, we trust, form an agreeable addition to the illustrated photography of the day.

* * * *

It is only right that we should publish the following extract from a letter received from the Secretary of the Sunderland Photographic Society in regard to the recent adjudication of Dr. Haswell:—

"Your letter to Dr. Haswell came before our Committee meeting a day or two ago. We are very much obliged for your kind offer of two medals, and we propose holding a competition for them about June, if you are agreeable. We consider we have been very fortunate in having such a good judge as Dr. Haswell, and quite agree with you that he decided very wisely in withholding the medal if the work was in his opinion unworthy of the honour. It is the best way to incite the members to make fresh efforts to attain a higher standard of excellence; and I think all the members of the society agree with me, now that they have looked at the matter in the right light."

The letter is exceedingly gratifying to us, and we feel sure that the competition in June will see better all-round work.

* * * *

THE Secretary of the Birmingham Photographic Society advises us that the exhibition of members' work will be

For Contents, Prize Competitions, Notices, etc., see page 48.

considerably more extensive this year. The members have sent in nearly 400 exhibits—surely a first-class record of work done.

* * * *

DR. EMERSON'S name has been so constantly before the public with reference to "Naturalistic Photography," that it will be quite a relief to our readers to "change the venue." A work from Dr. Emerson's pen has just been published under the title of "English Idylls." The following is an excerpt from the notice of the book which appeared a few days since in the *Pall Mall Gazette* :—

"Word-painting, like all other arts, has its proper times and uses, but we doubt whether it has ever been less appropriately employed than in Mr. Emerson's description of a fisher-maiden putting a worm on the hook—a process on which the poet or artist should scarcely care to dwell. 'As she fenced with the lively bait that 'twixt her fingers slipt, like silvery eels through the narrow meshes of a net, her hair sable as the coot's wing—loosely enkerchiefed—waved wantonly 'gainst her temples. . . . While striving with the dew-worm, her eyes, bright and humid, were in turn like skies in April; but when the bait was thrird and dangled in the stream she silent sat, and so gently flowed the tide along that she could hear the drowsy moths flutter as they sipped the nectar from the fragrant lychnis cups, and the tardy warblers piping in their swaying nests.' There is too much of this sort of thing in the volume. Mr. Emerson has made the fatal mistake of supposing that such elaborate bombast, full of tropes and inversions, is more 'idyllic' than a simple and unembellished narration of facts."

* * * *

WE have been favoured with a copy of the current issue of the *Art Journal*, to which we briefly referred last week. The article on "Winter Photography for the Artist," by H. P. Robinson, concerns us most. It is in the admirable style so well known and appreciated; as might be expected, it is somewhat educational, and is, of course, written mainly for those who require only to practise photography as an aid or helpmate to painting. In writing of snow scenes, he says, "The painting of snow does not rise above the quality of figure-painters' landscape. Turner's 'Frosty Morning' is perhaps the truest rendering of a black frost ever painted." The illustrations accompanying the article are, "Study of Hoar Frost on the Buss-Alp Path, Grindelwald," by Capt. Abney; "A Frost Study," by Frank Hopp; "A Quiet Stream," by Ernest Spencer; and "Sandringham," by H. Bedford Lemere. Mr. Robinson says, "Winter offers a great number of good subjects for the painter, but there are almost insuperable difficulties in the way of studying the infinite detail of wintry nature out of doors. Here steps in the younger sister, Photography, as the beneficent handmaid to the older art. . . . In making snow pictures, I should, with few exceptions, prefer sunlight. The increased contrast would give the delicate light and shade a better chance. I do not think that any appreciative difference in exposure need be made between scenes of the kind taken in sunlight, providing the light is otherwise the same." The whole article is worthy of close perusal, but we have given the above quotation because we feel that many of our readers will value the opinion of so able a master in the art upon the subject of "Winter Photography." The Bishop of Ripon contributes an able article to the same number upon "Art and Culture." We are in accord with much that he writes, and many of our readers will be ready to find an answer to the following, which we extract from the article :—"Who can resist Pleasure when

she comes adorned with all the attractions of art and culture?"

* * * *

A NOTION appears to have got abroad that we intend abandoning the "Home Portraiture" Special Number of the AMATEUR PHOTOGRAPHER. This is not the case; the work is well advanced, the illustrations being nearly all ready. It will far surpass any of our previous "Specials," and will contain an autotype print, "Children of the City," by Alex. Keighley; Woodburytype print, "Meditation," by Alfred Stieglitz; a collotype, "Day Lilies," by Mrs. Brian Hodgson; and another collotype, "Little Lord Fauntleroy," by A. R. Dresser, and about forty process blocks. We offer to our subscribers sincere regret at the delay, but hope soon to be able to fix definitely the date of publication.

* * * *

THE Newcastle-on-Tyne and Northern Counties Photographic Association are providing a very extensive exhibition, which will be opened on the 18th of April, and remain open until the 3rd of May, in the Central Exchange Art Gallery. We note that no less than eleven classes in photography and four in lantern slides are open to "professionals and amateurs." We regret this exceedingly, for reasons we have often stated. The rules and regulations state, "Rule 6: In the amateur classes the work must be entirely the work of the exhibitor." There are five classes "open to amateurs only;" all the work entered in these classes, we take it, "must be entirely the work of the exhibitor." What about photographs entered in the eleven classes open to "professionals and amateurs"?

The conditions under which photographs are entered for competition at photographic exhibitions are far too loosely drawn. There does not appear to be any form of declaration attached to the prospectus, and although the executive have an admirable list of classes, and no less than two gold, twenty silver, and eighteen bronze medals to award, we venture to predict that upon such a carelessly arranged prospectus the number of entries will not be numerous, and the best class of exhibitors will not compete.

* * * *

It is not the first time that we have called attention to want of care in drawing conditions for photographic exhibitions, and we venture to think that the time of the Council of the Photographic Convention and the Conference Committee of the Camera Club would not be wasted in drawing up a set of rules, conditions, and classes, as suggestions for the promoters of photographic exhibitions. There are too many exhibitions, prizes are far too numerous, and as a consequence the work shown is frequently of a very ordinary character.

* * * *

MR. A. STROH, we regret to say, has been somewhat indisposed, and it will be a few days before we receive his award upon the slides contributed to our "Stereoscopic Slide Competition."

* * * *

IN connection with the AMATEUR PHOTOGRAPHER Competitions we have made the conditions as stringent as possible, resulting, we are pleased to say, in an increase in the number of competitors, and a far higher standard of

excellence. We are quite certain that the same end would be gained at exhibitions if greater care was taken in arranging conditions and classes.

* * * *

WE are pleased to note the formation of another photographic society, under the title of the Spen Valley Photographic Club. The head-quarters of the club will be at Cleckheaton, and Mr. W. H. Wright, of that town, will be pleased to hear from any gentlemen who may be desirous of joining.

* * * *

PHOTOGRAPHS AT KEIGHLEY.

BEFORE making our few remarks upon the principal photographs entered for competition at the Keighley Photographic Exhibition, we would state that we have received a press copy of a somewhat lengthy letter addressed by Mr. J. A. L. Robson, the very able and courteous Secretary of the Keighley Institute, to our contemporary *Photography*, with a request that we should publish the same; this request we regret we cannot comply with. The letter answers certain misstatements made by our contemporary with which we have no concern, but we cannot refrain from saying that the reflections made upon the exhibition by the editor and his reporter are quite unwarrantable, and show considerable ignorance and much bad taste.

The photographs contributed to the exhibition this year are certainly of a higher standard than last year; they may not be as numerous, but, as a whole, the competitors show much more care and attention both to the technical and artistic qualities of the photographs they have entered for competition.

The four pictures entered by Mr. Lyd. Sawyer have many characteristic points; they are all typical of the Tyne. "On the River Tyne," for which Mr. Sawyer was awarded first prize, is perhaps the most truthful, and is a faithful picture of the life and bustle of the river. In one, or two, of the others Mr. Sawyer has "hazed off" his distance, in our opinion, "not wisely, but too well;" still, they are four very fine pictures. Mr. J. P. Gibson, of Hexham, takes the second prize in this class; he exhibits only two pictures, "June" and "September." We much prefer the former, which is an admirably-chosen scene of perfect balance, well lighted, and with an unobtrusive figure introduced. Mr. George T. Harris shows four good frames, "A Jersey Farmstead," "Gathering Seaweed," "A Jersey Lane," and "Mont Orgueil Castle;" this latter view secured him the certificate. All the views are well chosen, and "Gathering Seaweed" would be the best picture were it not for the stiff posing of the figures.

In this class Mr. F. W. Sutcliffe exhibits two or three of his landscapes, which, in our opinion, are neither of artistic or technical value. A few fairly-chosen frost scenes are exhibited by Mr. F. Scamell; and the two exhibits by Mr. E. Greaves of "Views in Derwentwater," deserve notice, but each suffer from the fault of the day—too much foreground.

In the next class, "Subject Picture," Mr. H. P. Robinson takes the first prize with "Gossip on the Beach." This is Mr. Robinson's latest picture, and certainly is far in front of "Merry Fisher Maidens." We gazed very thoughtfully at the picture, and would first grumble because it is hung above the line of sight; this exaggerates

what we would very respectfully suggest is a fault in the composition, the horizon-line, which is placed too high in the picture. The figures also appear to us somewhat to obtrude themselves in the foreground; the grouping is crowded, and the accessories rather too numerous and obtrusive; still, we have a charming picture, and we would venture to hazard the opinion that there is no other man living who can portray such a subject in photography. The colouring is soft and grey, broken by bright flecks of light upon the water and the deep shadows of the figures. The earnestness of the gossippers is depicted with a truth quite surprising when we think of the unsympathetic lens and the instantaneous and unyielding receptiveness of the sensitive plate. Mr. Sutcliffe takes second place with a fine study of an old woman, truly a splendid portrait of a most admirable model. Mr. Sutcliffe exhibits other pictures; we have his everlasting Whitby fishermen and women, taken in front and behind, standing, sitting, kneeling, crouching, and so on *ad infinitum*. We have seen these men and women at every exhibition for years, and are tired of them. Lately Mr. Sutcliffe has thought fit to "haze off" the distance, until in some that he exhibits Whitby is completely enveloped in fog, although there is a bright light upon the men and women on the jetty. Mr. Sutcliffe is an old exhibitor, and ought not to give us the opportunity of calling attention to careless work, but it is a fact that on one print exhibited there are no less than *five blemishes*; of course, in these days such a thing is inexcusable. The certificate of the class went to Mr. and Mrs. Anckorn for "My Time is Done," really a subject picture. An old man has taken down the kitchen clock, and has done his best with the domestic bellows to denude it of the "dust of ages" all to no use, leaving one to draw the inference that the clock is done. The picture is well lighted, and the position of the figure not at all forced or unreal, as is the case with some of the photographs by the same exhibitors. Mr. Ralph W. Robinson shows a pretty study, "Good-bye, Granny," but we should much question the desirability of taking such a subject with a portrait lens; another by him is "The Jolly Young Miller," which, though good, is hardly a subject-picture. We notice that Mr. R. W. Robinson mounts his prints on Whatman's rough drawing-paper; the grain in the paper is a happy contrast to the smooth surface of the usual commercial mounts. Mr. Lyd. Sawyer exhibits in this class his "Here's a Nest, Lads!" which is strangely chosen, and we fancy there are signs of the brush on the print. Another by him, "How Happy could I be with Either," is badly grouped and lighted. The class is not a strong one, and there does not seem any direct departure from the beaten path, except by Mr. H. P. Robinson.

In Architectural and Interiors, professional, some most admirable work is exhibited by Mr. Wm. E. Henry; the first prize was awarded for "Minster (Lichfield) Spires" and "Sleeping Children." All the other frames were of equal merit, and thoroughly deserve recognition. The second prize was awarded to Mr. T. Scotton for a frame of nine views executed in platinotype. The centre one has been exhibited by him before, and we fancy medalled, in which case it had no right to have been included in the frame. The certificate went to Mr. R. W. Robinson for a most charmingly-lighted interior of "The Marble Hall." The light piercing through a screen, and the reflection of a fountain upon the floor are really marvellous. We should

like much to visit the place so well reproduced by photography. Messrs. Dew and Co. contributed several very good views of churches at Warwick, Lichfield, Coventry, etc.

Enlargements, professional, were a very small class. The first prize, "Study of an Old Man," by F. W. Edwards, was very fine. No other call for comment here.

In portraiture, "Miss Mabel Francis," by W. W. Winter, takes first prize, and is a fine example of the exhibitor's work. "Elsie" is another; but, Mr. Winter, you really must not draw as well as paint and still expect to have your work classed as a photograph. Mr. Winter is not so great a sinner with the brush as the recipient of the second prize, Mr. W. J. Byrne; that gentleman's portraits are really marvellous, and so long as the public require the photographer to call in the help of the painter, so long Mr. Byrne and others will provide for their requirements. The photographs exhibited are excellently executed, but they are more paintings than photographs. We were much struck with two portraits of girls, the work of Mr. E. Greaves, who was awarded a certificate for his work, and must compliment him upon the natural pose of the heads and the care displayed in retouching; in no way does it obtrude upon the sight, and we have not the least doubt that the pictures were very faithful portraits. A group by the same exhibitor showed great care. Mr. Ralph W. Robinson exhibited several of his admirable "Royal Academician" series, which are in every way up to those which have been medalled and received such very high praise in all quarters.

We shall have to leave the amateur section until our next issue, and trust we have said enough to prove that in our opinion the Exhibition at Keighley can hold its own, and is well worthy of support by all interested in photography, either as exhibitors or visitors.

* * * *

PHOTOGRAPHY AS AN ART TEACHER.

PHOTOGRAPHY has already done much by popularising works of art to make the general public familiar with and appreciative of good pictures. It is quite certain that the public were in need of such education at the time when photography stepped into the gap. Pictures they must have, and must have them at a price within their means, and as no English publisher saw the need, or had the enterprise to take advantage of it, the country was soon flooded with cheap German lithographs, plain and coloured, which were chiefly remarkable for their bad drawing, their utter defiance of the very grammar of art, and their want of truth to nature. The ignorance of everything which an artist ought to know descended even to their titles, which appeared in German on one side, and in English on the other—the latter generally being a ludicrous mistranslation of the former. Such pictures are still to be found in a few village inns and cottages, but the splendid coloured pictures issued by our illustrated papers and photography, together, have, we fervently hope, for ever stopped the sale of these awful specimens of German art.

But is photography as much used as it might be in educating the masses? Certainly it is not so much employed in this country as by our Continental neighbours, who seem to use it more largely for copying purposes. It may be that our artists and the owners of celebrated pictures do not care to see their works multiplied, and possibly fancy that the value of a work of art becomes

reduced when thus brought within the ken of the multitude. The first objection is a selfish one, and we can all well understand the feeling which prompts a man to keep a good thing to himself. But the other objection is, we fancy, purely imaginary, and not in any way justified by facts. Indeed, we can point to two instances in which popularity has greatly increased the value of a work of art. One of these was a picture painted by a leading artist for an illustrated paper, for which he received one thousand pounds. This picture after it had been reproduced and sown broadcast over the land, was sold by its proprietors for an enhanced sum, and a few months afterwards its new owner parted with it for more than three times its original price. The other example which we have in mind is the statuette "The Dirty Boy," which was originally exhibited in the Paris Exhibition of 1878. This was bought, as we all know, by Messrs. Pears for advertising purposes, and the sum they gave for it was five hundred guineas. Although this work has been copied and travestied in every conceivable form and material, there is no kind of question that its owners could easily make a profit on their purchase of three or four hundred per cent. if they cared to put up "The Dirty Boy" for sale. We think that these two cases will dispose of the erroneous belief that popularity of a work of art tends to decrease its value, for the reverse is the case.

For some reason which is not at once apparent, our French neighbours are not so conservative in their notions, and the best pictures in the *Salon* and other exhibitions are speedily and cheaply reproduced by "process." A glance at the illustrated books at any publisher's of foreign works, of which there are several in London, will at once show the extent to which these artistic productions are employed. But one publication which appears year after year seems to stand out boldly from the rest, both because of its excellent work and its cheapness. This is the *Figaro Salon*, by Albert Wolff, which is published in five parts, folio size, each part containing an average of fifteen pictures, which in quality are equal to fine steel engravings. A large proportion of these pictures cover a full page, that is to say, they measure about thirteen inches by nine, while a few are double this size. The process by which they are reproduced is that of Goupil (Boussod, Saladon et Cie), which is remarkable for producing a printing block in which the original marks of the artist's brush are plainly discernible. In this manner the best works of the modern French painters are brought to the homes of the people, and they cannot fail in fostering a love for that which is artistic and beautiful.

Photographic processes for the production of printing blocks are seen at their best in the reproduction of paintings. The old difficulty in dealing photographically with designs in colour has disappeared with the advent of Isochromatic plates. We therefore think that it is high time that the lovers of pictures in this country should have the same advantages as are possessed by their Continental neighbours. The only attempt in this direction which we can call to mind is the photographing of the pictures in the National Gallery, but the absurd prices asked for these photographs is prohibitory to the general public. There has also been an attempt to produce by process an illustrated catalogue of the Royal Academy pictures, but the work was not well done, nor was the price asked for it likely to make it popular.

Letters to the Editors.

WARM TONES IN BROMIDE PRINTS.

SIRS,—In my endeavour to find a developer that would give warm tones in bromide prints, I hit upon this formula. I fancy it is the old form of Thomas' hydroquinone for lantern plates.

I.					
Hydroquinone ..	..	..	..	80	grs.
Bromide potass. ..	..	..	..	15	"
Sulphite soda ..	..	..	..	1	oz.
Water ..	..	..	..	20	ozs.
Citric acid ..	..	..	..	60	grs.

II.					
Carbonate of soda ..	..	..	..	2	ozs.
Carbonate potash ..	..	..	..	2	"
Water ..	..	..	..	20	"

For use, equal quantities of each.

One is apt to get tired of the engraving black so much in demand, and a hankering still remains for the purple tones of the despised silver print. By this formula a happy compromise is effected, and a purplish brown is the result.

An ordinary negative requires an exposure of about fifteen seconds on the Ilford slow paper, a foot away from the gas, the image appears in about forty seconds, and development is complete in about three minutes. So much for its quickness. There is a tendency, however, in the misleading ruby light, to stop development at too early a stage, but it should be proceeded with until apparently rather deeper than required in the finished print, as a slight reduction is brought about in the hypo.

I cannot find any hydroquinone formula recommended by the Ilford people themselves for the bromide paper, and it seems to me a mistake that it is not included; the one mentioned works equally well with their brand of ordinary plates.

I enclose a print for your inspection.—Yours truly,

BERNARD ALFIERI.

AMATEUR PHOTOGRAPHERS IN THE ANTIPODES.

SIRS,—Now that a brother cornstalk has broken the ice with you, I venture to write you. Unlike Mr. McLean, I have had your paper from the first number till to date. The first time I saw it was in the window of a bookseller's shop in George Street, Sydney, N.S.W. (G. Robertson and Co.), in the shape of Vol. I. bound up. Needless to say, being in love with my camera, a then recent purchase, I entered the shop, examined the book, and bought it. The following morning, at breakfast, my landlady reminded me that gas was 8s. 6d. per 1,000 ft., and hoped I would be careful to turn the gas out before retiring in future. I had been up all night reading, but I did not mention it to her. Your magazine has been my only companion on many a lonely and lovely photographic ramble since then. Now that I have returned to England, I have a natural desire to try my luck, or skill rather, at one or another of your competitions. Your "Prize Tour" would have suited me to a T, but you say the pictures must have been taken in 1889. This kills me. I am sure you would have competitors from Sydney, Melbourne, Brisbane, and New Zealand, were some alteration made in your terms. You must remember that the Antipodean summer is the English winter, and although pictures can be had in the Australian winter quite as easily as in the English summer, still the "outings" of the societies in Australia are in their summer, because the days are longer, and the conditions of "camping out" are more comfortable. Were you to admit competitors from the Antipodes to your "Prize Tour," whose pictures had been taken within the twelve months prior to June 30th, 1889, that might meet the case. I am speaking from personal knowledge of many New South Wales amateurs, for I was at one time a member of the N.S.W. Amateur Photographic Society, and on the committee.—I am, yours faithfully,

January 11th, 1890.

CORNSTALK.

NOTE.—We will in this case accept the photographs taken in the year prior to June 30th, 1889.—EDS. AM. PHOT.

* * * *

GLAZED SURFACE PRINTS.

SIRS,—I always read with great interest any correspondence which appears in your columns referring to glazed surface prints,

as I have, in common with many others, failed in obtaining the gloss which I admire so much, and which I think admirably adapted to some prints, though on the other hand I must agree with Mr. C. Hethon Lewis that for view work a matt surface is in most cases preferable to a glazed one. In that gentleman's letter he made mention of an enamelled metal plate sold by Messrs. Fallowfield and Mr. Gotz. Will he kindly state for the benefit of others as well as myself the price of those plates, say for half-plate pictures, should they be sold in different sizes, also how he mounts his prints so that they retain that gloss. An answer, I feel sure, will oblige a large number of your readers as well as yours faithfully,

Jan. 13th, 1890.

* * * *

HYDROQUINONE.

SIRS,—I have been using the one-solution hydroquinone developer for some months, and, as a rule, with splendid results, but lately I have had another experience with it. Instead of the developer being clear, and giving clear, quick-printing negatives, it is of a dark purple colour, and gives a negative of a deep yellow tinge, which, of course, hinders printing very much. Also when of this colour it stains the hands almost as badly as pyro developer. I may say that the proportions of the developer are as follows:—

Hydroquinone ..	..	..	..	160	grs.
Sodium sulphite ..	..	..	..	300	"
Carb. potash ..	..	..	..	400	"
Water ..	..	..	..	20	ozs.

Perhaps some of your numerous readers will enlighten me on the subject.—Yours truly,

H. ROWLAND.

January 11th, 1890.

* * * *

GOLD AND PLATINUM.

SIRS,—Last summer I got an idea that a print in gold could be obtained by printing as usual on the Platinotype Company's col l, bath paper, and brushing over it a solution of gold. I tried it and the result was as I expected, a print in a violet-blue tint, due to reduced gold. Is this anything new, as I have not heard of it being done? I intend trying to obtain a rich dark tone by mixing some substance with the gold, but as yet I have had no time to further experiment. The print develops just as in the cold-bath development.—Yours, etc.,

SYDNEY WEISS.

* * * *

FORMATION OF A LANTERN CLUB.

SIRS,—Will you permit me to call the attention of your readers to a step which I trust now to see taken, viz., to bring together, either by means of a club or association, in a practical form, those who are interested in the work of photographic optical lanterns.

I will not here detail the advantages that may possibly accrue from such an association, except to suggest (a) the development and improvement of the lantern itself, (b) to help in popularizing it generally, (c) to enable those who are fond of so delightful and scientific an amusement to become known to each other, and thus develop their common pursuit, (d) to hold in London and the country periodical exhibitions, (e) to facilitate the interchange of photographic slides, and (f) generally to promote lantern work.

The basis of such an association and its rules remain to be formulated. Meanwhile I wish to put plainly through your columns a very pointed but respectful request, viz., will all those who are favourable to the idea, forward to me at 46, Chesilton Road, Munster Park, S.W., or to the Hon. Slingsby Bethel at Chelsea Lodge, Chelsea Embankment, their names and addresses, in order that they may be invited to a meeting or informed of any proceedings that may be taken.—I am, yours very truly,

T. H. HOLDING.

* * * *

PHOTOGRAPHY AT BOULOGNE.

SIRS,—I am sorry to say I cannot inform Col. Verney whether the tax has been removed, as though I wanted to photograph the cathedral very much myself, I could not do so, as I left Boulogne a week before I first intended, and I had put it off till the end.—Yours truly,

Jan. 11th, 1890,

GERALD STRICKLAND.

Winter Work.—XV.

By T. C. HEPWORTH, F.C.S.

ON FRAME-MAKING.

THE amateur photographer who is skilled in the use of carpenter's tools has a great advantage over his fellows, for he can not only fit up his dark-room with all kinds of conveniences, but he can make much of his apparatus with his own hands, and thus be independent of outside help. Those with long purses are apt to decry the efforts of the amateur carpenter, and perhaps naturally prefer to call in professional aid. But in doing so they quite lose sight of the pleasure which a man derives from constructing things for himself, and the advantage of producing results at the expenditure of a few shillings, whilst others will spend as many pounds, and fail to do as well. It may be said that picture frames are so cheap that it is not worth while to attempt to make them at home. But this argument might be applied to a hundred other things besides frames—and even to photographs themselves—for no one can say that nowadays they are not cheap. The true amateur will never listen to such pleadings, for his pleasure is found in his hobby and the thousand and one little employments which it brings to him.

I feel sure, therefore, that many of my readers who have leisure will be disposed to take up the art of frame-making, and will thus be able to beautify the walls of their rooms with the work of their cameras. The power of being able to make a frame will also often induce them to give a welcome present to a friend, and one which will be the more valued because it is of an unusual character.

As a beginning, the amateur frame-maker should confine himself to the purchase of mouldings, which are sold of various patterns in lengths of about 10 ft. A plain, flat oak moulding, with a gold slip inserted beneath the glass, is a safe pattern for a photograph, for it will always look well on any wall. But the most captious will be able to find a pattern and style to suit him, for the different mouldings now obtainable are of the most varied description.

Photographs of an ecclesiastical character will often look well in an Oxford frame, because of its cruciform corners. But it must be remembered that there is a stringent and very necessary law against the admission of pictures so framed to all exhibitions—not because there is any moral wrong in framing a picture in this way, but because their presence entails loss of wall space. An Oxford frame may be likened to an octopus, by reason of the eight projections with which it is furnished, and for which room must be found, unless they are at once ruthlessly amputated. Intending exhibitors must, therefore, eschew the Oxford style of frame, or keep them for home use. They are easy enough to make, and no one who has purchased one as a pattern, and is a little skilled in the use of tools, can fail even in the first attempt at constructing one. The only point where he is likely to be baffled is in cutting the rebate, in which will subsequently rest the picture, glass, and back. For this work, as well as for more general purposes, I have employed a very useful little tool, which I purchased long ago in Liverpool, and which may, for ought I know to the contrary, be obtainable in London, but I have never seen it here, except in my own workshop. It is shown at fig. 1, and is known as a rabbeting tool. It is here shown full size, and its parts will be readily understood by help of the reference letters. The vertical part is round, and made of brass, with an oblique stem springing from it on the right-hand side, which forms the shank to which the handle (not shown in the cut) is attached. C is a set-screw, the duty of which is to hold the cutter *a* tightly in position after it has been adjusted to give a cut of a certain depth. Another set-screw, *b*, controls

the position of a kind of right-angled shoe, which is hollowed out so as to clamp upon the vertical part. This shoe has a flat side facing the cutter, and it will be readily understood

FIG. 1.

that its distance from the cutter can be adjusted to any desired distance. Thus it will be seen that the depth of cut can be regulated, and also the width of the rebate which is cut. In the position in which the tool is shown in the drawing, the piece of wood upon which it is desired to operate would be held rigidly on the edge of the work bench or table, and after the cut had been made to its full depth, by repeated strokes the tool would be turned over so that the cutter acted vertically upon the top face of the same piece of wood. By this means the two cuts would meet, and a square rod would be cut out from the material operated upon, the space occupied by it forming the required rebate. By adjusting the set-screws between the two cuts the width and depth of the rebate can, of course, be varied to any required measurement. This useful little tool is invaluable to the amateur photographer, because it can be applied to so many other purposes. Suppose, for instance, that a carrier is required for the accommodation of a plate in a dark-slide which is far too big for it. This rabbeting tool will soon cut the necessary groove for the reception of the glass after the carrier has been cut out of soft pine. It is also of service in cutting the tongue upon each side of a temporary camera front, and for many other purposes too numerous to specify. Its cost is only about one shilling, and it is so solidly made that it will last a lifetime.

The necessary tools for general frame-making are few, but they should be of the very best quality. Their cost is very little, if the amateur worker be a good enough carpenter to make his own mitre-block and shooting-board. But let him not attempt to make these unless he is a first-rate workman, for if either be the least out of truth, every frame made will suffer for the fault. Both of these necessary appliances can be bought ready made, and I advise that they should be obtained thus, to save both disappointment with results and much loss of temper.

FIG. 2.

The simple mitre-block—whose duty it is to cut off lengths of moulding at an angle of 45 degs., so as to form a mitre joint at each corner of the frame—is shown at fig. 2. It needs but a few words of description, so simple is it in design. It consists of a baseboard, upon which is firmly glued and

screwed from below a somewhat thicker piece of wood, in which are three saw-cuts. One of these is straight across the centre, and the other two are each cut at an angle with it of 45 degs., but in reverse directions. The contrivance, it will be seen, forms a step, upon the lower level of which is placed the wood, or moulding, to be cut. By aid of the middle saw-cut—which now serves as a guide for the saw—the piece of wood thus inserted may be cut straight across, or, by utilising either of the other cuts, at an angle, which will at once render it fit to serve as part of a picture frame.

The other contrivance, pictured at fig. 3, is the shooting-

FIG. 3.

board, which needs almost less description than the mitre-block. Here, again, we have a step arrangement, and a means of holding the lengths of moulding which have already been cut on the mitre-block, in such a position that a plane run on its side along that lower step will effectually shave off enough of the cut end to make a clean join with another end which has been similarly treated. I may mention here that if the saw used in the first operation be of the right description, a fine tenon-saw, the necessity for this after-business of shooting—that is, planing—will be obviated, provided that the mitre-block is absolutely true. It must be true not only with regard to correct angles, but also in respect to the saw-cuts, which must be perpendicular to the baseboard, otherwise the frame will not lie flat—that is to say, its parts will not occupy one plane.

There is another form of mitre-block, shown in fig. 4,

FIG. 4.

which presents some advantages, and certainly it is a very easy one to construct. In this case the saw always occupies the same position in the transverse saw-cut, the pieces of wood, or moulding, being moved to the right or left of it as may be required. The only objection to the use of this instrument is that few persons are educated up to using either hands indifferently. Usually the right hand is used for guiding the saw, and in this case the left hand must be stretched over it to hold the wood whilst it is being cut. Those who use both hands indifferently will not suffer this inconvenience.

It need hardly be pointed out that the plane used for this wood must be square in section, or it will not give a true vertical cut when laid on its side. The actual form of the plane beyond this does not much matter, but it must be sharpened and set to a very fine adjustment. There is a

description of plane made with a single, instead of a double, iron, which does well for the work, but an ordinary "jack" or a "trying" plane will answer the purpose. Still, it is far better to devote a plane to this one purpose, and to use it for nothing else. A form of plane which cuts with great ease is one in which the iron is set obliquely—called, I believe, a bevel plane. All these different forms are made with the handle set in the side, instead of in the top, immediately behind the iron. This side arrangement gives better control over the tool, as it slides to and fro on the lower step of the shooting-board. But the instrument which is better than any for frame-making is a good metal plane. It can be set to cut a far finer shaving than a wooden tool, and it has the advantage of weight—that is to say, when once in motion it does half the work by its own impetus. It is not, moreover, subject to the scratches and other evidences of wear and tear which are common to wooden planes.

(The Yorkshire College, Victoria University).

WEIGHTS AND MEASURES.

THE *mass* of any substance is the absolute quantity of matter which is contained in it. It is measured by, and is proportional to, the *inertia* of the substance, *i.e.*, the resistance which it offers to any force which tends to set it in motion if it is at rest, or to stop it if it is moving. Two bodies have equal masses if they have the same inertia, or, in other words, if the same force acting on them for the same time produces the same effect. The particular force which is generally employed for the comparison of masses is the attraction of the earth, or, as it is technically termed, the earth's gravitation.

The *weight* of a substance is the attraction which the earth exerts upon it, and the weights of different substances at the same place are proportional to their respective masses. If one body A weighs twice as much as a second body B, the mass of A is double the mass of B; if it weighs three times as much as B, its mass is three times as great as the mass of B. A set of weights is merely a number of masses of metal or some other substance to which we have given numerical values derived from some unit. When we weigh a substance we compare the attraction which the earth exerts upon it with the attraction which the earth exerts upon our standard masses or "weights," and therefore, since this attraction is proportional to the masses, we compare the mass of the substance with our standard masses or "weights."

It is very important to observe that the mass of a body is quite distinct from its weight. The mass—the absolute quantity of matter which it contains—is invariable, and is quite independent of its shape, temperature, position, etc., but its weight—the attraction which the earth exerts upon it—varies with its position on the surface of the earth, or strictly speaking, with its distance from the earth's centre.

In these articles the weights of different substances will be taken, as is usual, as representing their relative masses.

The term "mass" will also frequently be used, and will always denote the absolute quantity of matter which a substance contains, without reference to its chemical nature.

The *volume* of a substance is the space which it occupies, and is generally expressed in terms of the unit of length. Volume is a property quite distinct from mass, and we frequently compare the volumes of substances without reference to their masses, and *vice versa*.

Units.—In all cases of measurement we must have some unit, in terms of which the magnitudes may be expressed. For example, if we say that the distance across a field is 30, the statement has no meaning, but if we say that it is 30 feet or 30 yards, it becomes intelligible, because the magnitude of the unit (a foot or a yard) is known. So, too, if we say that a certain substance weighs 10, no definite information is conveyed, but if we specify the particular unit by saying 10 grains, or 10 pounds, or 10 tons, we shall then be understood.

Units may be either *natural*, like the unit of time, which is based upon the motions of the heavenly bodies, or *arbitrary*, like the units of measures and weights, which have been selected and established by the decrees of national governments.

Two systems of weights and measures will be described—the ordinary English system, and the French, or metric, system. The exact relation between the two is known, and the knowledge is sometimes useful. Each system is, however, quite independent of the other, and the student may use one system without troubling himself about the other at all. Whichever system is selected must be rigidly adhered to, for if any attempt is made to use both systems concurrently, great confusion will arise.

The English System.—The unit of length is called the *yard*, and is the distance between two lines across two gold plugs in a bronze bar in the office of the Exchequer. The distance is quite familiar. The yard is sub-divided into three equal fractions termed *feet*, and each foot is divided into twelve equal fractions termed *inches*. Each inch may be sub-divided into any number of equal parts.

Volumes are expressed in terms of the unit of length, as a cubic foot, a cubic inch, etc.; and also sometimes in terms of the unit of weight.

The unit of weight is a certain piece of platinum in the office of the Exchequer, which is termed the *pound avoirdupois* (lb.). The pound is subdivided into ounces (oz.) and grains (gr.), which are the only subdivisions used in practice, and also the only subdivisions legalised by Parliament: 7,000 grs. = 1 lb.; 437.5 grs. = 1 oz.; 16 ozs. = 1 lb.

A slightly different system, known as “troy weight,” is used in buying and selling gold, silver, platinum, and other precious metals in the *metallic state*. The grain is the same as in the preceding system, but the value of the ounce and pound are different, and a special subdivision, the *penny-weight* (dwt.), is used.

$$\begin{aligned} 24 \text{ grs.} &= 1 \text{ dwt.} \\ 480 \text{ grs.} &= 20 \text{ dwts.} = 1 \text{ oz.} \\ 5,760 \text{ grs.} &= 240 \text{ dwts.} = 12 \text{ ozs.} = 1 \text{ lb.} \end{aligned}$$

A special system, known as “apothecaries’ weight,” was at one time used for dealing in drugs and chemicals and the compounding of prescriptions. The ounce and pound had the same value as in troy weight, but two special subdivisions, the scruple and the drachm, were used, thus:

$$\begin{aligned} 20 \text{ grs.} &= 1 \text{ scruple.} \\ 60 \text{ grs.} &= 3 \text{ scruples} = 1 \text{ drm.} \\ 480 \text{ grs.} &= 24 \text{ scruples} = 8 \text{ drms.} = 1 \text{ oz.} \\ 5,760 \text{ grs.} &= 288 \text{ scruples} = 96 \text{ drms.} = 12 \text{ ozs.} = 1 \text{ lb.} \end{aligned}$$

Since the Act of Parliament in 1864, this system of weights is no longer recognised, and the avoirdupois pound, ounce, and grain must be used in all dealings in chemicals, drugs, etc., just as in the case of other substances. All weights less than an ounce should, therefore, be expressed in grains; the scruple and the drachm are not used, and 1 oz. contains 437.5 grs.

Fluid measure is a method of measuring volume which is applied exclusively to liquids. It is intended to represent the volume of a definite weight of water at the particular temperature of 62 degs. F. The unit is the *gallon*, which is the

volume or bulk of 10 lbs. (70,000 grs.) of water at 62 degs. F. The useful subdivisions of the gallon proper are the quart and the pint, to which may be added the fluid ounce, thus:

$$\begin{aligned} 437.5 \text{ grs.} &= 1 \text{ fluid oz.} \\ 8,750 \text{ grs.} &= 20 \text{ fluid ozs.} = 1 \text{ pint.} \\ 17,500 \text{ grs.} &= 40 \text{ fluid ozs.} = 2 \text{ pints} = 1 \text{ quart.} \\ 70,000 \text{ grs.} &= 160 \text{ fluid ozs.} = 8 \text{ pints} = 4 \text{ quarts} = 1 \text{ gallon.} \end{aligned}$$

So far it will be seen that there is a simple relation between fluid measure and weight. The fluid grain is the bulk of the grain of water, the fluid ounce is the bulk of the ounce, the pint is the bulk of 20 ozs., and the gallon is the bulk of 10 lbs.

In the subdivisions of the fluid ounce, however, which are still used by pharmacists, and also very frequently in the making up of photographic formulae, this simple relation no longer holds. Unfortunately, when the fluid ounce was altered by Act of Parliament from the bulk of 480 grs. to the bulk of 437.5 grs., the original subdivisions were retained, and we now have the fluid ounce of water, weighing 437.5 grs., divided into 480 equal parts which are termed *minims*. Another sub-multiple employed is the fluid drachm.

$$\begin{aligned} 60 \text{ minims} &= 1 \text{ fluid drm.} \\ 480 \text{ minims} &= 8 \text{ fluid drms.} = 1 \text{ fluid oz. (437.5 grs.).} \end{aligned}$$

It will be seen that a minim is the bulk of only 0.91 gr. of water, and hence there is no simple relation between them. If the student decides to use the English system, he will do well to avoid minims and drachms altogether, and to use measures graduated in *fluid grains*, expressing as far as possible all weights in grains or ounces, and all measurements of liquids in fluid grains or fluid ounces.

(To be continued.)

By MAJOR J. FORTUNÉ NOTT.

APPARATUS.

(Continued from page 12.)

Hints Respecting the Focussing Screen.—An oiled rag rubbed over the rough surface of the glass occasionally, by making the graining less perceptible, facilitates careful focussing. Some small pieces of very thin glass, such as that used in mounting objects for the microscope, cemented at different points on the ground surface of the screen with Canada balsam, supply the means of focussing in cases where the utmost possible sharpness of image has to be obtained.

Manufacturers might with advantage to photographers rule the focussing screens attached to their larger-sized cameras into sections that would enable views to be arranged thereon within the exact compass of any of the smaller-sized plates it is occasionally found serviceable to employ. As these sub-divisions of the screen are not only frequently useful, but enable economy to be practised, the purchaser of a new camera, if it is above the dimensions of a half-plate, is recommended to make them himself with a fine pen. The illustration on the following page shows the way a screen may be ruled with advantage.

As this cut is drawn to scale one-fourth the size, and represents a $6\frac{1}{2} \times 8\frac{1}{2}$ plate subdivided into half and quarter plates, it can be used for the purpose of obtaining the correct measurements. The round spots show where the clearer points formed by the cemented glasses should be placed.

If the focussing screen gets broken, away from a town where it can be replaced, some substitute must be sought for. A celuloid film after immersion in a hypo bath, or one that has had the emulsion removed by hot water, can be utilised. An old glass plate, cleaned and subsequently dabbed over with putty to give it opacity, may be made to

serve the purpose. Even a piece of tissue paper may be successfully employed. A very little ingenuity can soon supply the desideratum. At a pinch a small piece of the broken focussing screen itself, held in register by the hand or fastened in position with a sheet of paper, can be made to answer the purpose. The writer adopted this method on one occasion, and although great care had to be exercised, which resulted in some loss of time, the negatives were in every case so perfectly satisfactory that the dread which had previously been felt now and again, when travelling, of the focussing screen sustaining damage, and so rendering the camera unavailable, has never since been experienced.

The Bellows.—This part of the camera should be constructed of Russian leather, which is both light, durable, and ornamental. Another advantage is claimed for this material by travellers in tropical countries, who say that it is less liable to the attacks of certain destructive insects than many other kinds of leather. In some cheap forms of cameras, chiefly those of American manufacture, the bellows are made of very unsuitable material, and as this part of a camera is a very important one, the would-be purchaser of photographic apparatus should give it most careful scrutiny.

Apart from the question of the material used in its construction, the interior should be *dead black*, in order to effectually prevent any stray rays of light from the lens being reflected on to the exposed plate, which would tend to produce a slight but very undesirable veiling of the negatives, that, of course, will only become apparent during their development. The length of the bellows will in many cases be found to determine the length to which the camera can be extended, and upon this point the remarks under a previous heading are applicable. The bellows should, of course, be capable of keeping the inside of the camera perfectly dark, and a thorough testing is the only way to prove whether it is entirely free from defects. It should be borne in mind that the most minute puncture therein, so small that the closest scrutiny may easily fail to detect it, is sufficient to render nugatory all other efforts to produce clear negatives. The shape of the bellows, whether it be of the square or conical pattern, is a somewhat unimportant detail. As before said, no folds, under any circumstances, should intercept any of the rays between the lens and the plate. Once this point is assured, the pattern preferred becomes a matter of taste. Cameras, however, made with the conical form of bellows can generally, for apparent reasons, be closed into a smaller compass than those having the other shape.

Hints respecting the Bellows.—After a camera has been acquired, the bellows become its weakest feature, for in all

probability wear and tear from usage will begin to tell thereon sooner than upon the parts constructed of wood. It should therefore be kept carefully protected, and be periodically examined. As it is also the part most prone to the collection and retention of dust—that arch enemy of good photography—the interior folds should be well dusted every time the camera is taken out for use.

These are, of course, minute details, and as they are here enumerated for the benefit of tyros in the art, it may be as well to point out a fact which is a recognised one by all producers of really good photographs, namely, that first-class work with the camera, or, for the matter of that, in every other branch of the art, can only be accomplished by strict attention being paid to certain details which might by the uninitiated be considered as being of the most trivial character. This feature of photography will, it is hoped, be deemed a good and sufficient excuse for any stress which has been, or on subsequent occasion may be, placed upon sundry minute particulars in cases where it can be shown that they are nevertheless capable of exerting important influences. An instance in point was lately discovered by Mr. Lyonel Clark, who found that the quality of the sensitive plate was deteriorated by exposure in a camera which had been kept in a damp place, the influence exerted by the moisture being sufficiently powerful to cause a fogging of the plate after it had been subjected to it for only a few minutes. The remedy for this previously unrecognised source of trouble is obvious.

If by any accident the bellows becomes perforated, it can easily be temporarily repaired with a little court-plaster, or, if this is not at hand, a postage stamp may be utilised to tide over the difficulty.

Camera Stand.—Except for studio work, this piece of apparatus is generally made in the portable form of a tripod, with the legs folding up. It can safely be asserted that a considerable improvement on this form of stand will have to be made before one that can be called perfect is placed at the service of photographers. The desideratum is to obtain a support, firm, fairly rigid, capable of being easily extended to a good height or lowered as required, and at the same time can be closed up, when not in use, into a compact and convenient shape. The lower joints should have extensions which slide up or, down, and when selecting a tripod it should be examined to see that these sliding attachments work easily, and can readily be clamped at any height. Well-seasoned wood is required in the manufacture of these stands, otherwise serious annoyance may be caused by the sliding parts refusing to move. Of course, the fewer joints there are in a tripod the firmer it will be; but here again something must be sacrificed for the sake of portability. A tripod that folds up compactly, is easily got ready for use, and of the required height is a serviceable article. If not all that it might be in the matter of stability, care when using it, and following some advice upon this point—which will be found in the practical hints regarding the employment of the camera, to which it is proposed to draw the reader's attention in another part of this work—will surmount the drawback. It is as well to have more than one tripod, and to have them varying in height, but if one is to be selected for all work it should be of sufficient length to allow of its being set up in a rigid manner, at a height that will enable the focussing to be accomplished without any stooping on the part of the operator.

Metal tripods made of tubing in which the parts slide one into the other after the manner of a telescope, and are fastened in position when extended by screw joints, are not recommended. They shut up into a comparatively small compass, but this is their only

attractive feature. They are far from rigid, and on a warm day the metal is liable to expand, which so tightens up the screws that they can defy all efforts to loosen them.*

Rambling Papers.—VIII.

By W. K. BURTON.

THE PLATINOTYPE PROCESS.

OF the later developments of platinum printing I have not here (in Japan) had the opportunity of having any experience. Nearly a year ago a few scraps of the "printing-out" paper were kindly sent me by a friend, but more to see whether it would stand the long journey or not than for practical purposes. It was merely wrapped in some yellow paper and enclosed in a letter, and it speaks very well for the keeping qualities of the paper that it gave quite brilliant prints, although it had been enclosed as described for nearly two months. It has been found impossible to send the "cold bath" paper here, and I do not think that I am abusing confidence in stating that the reason is that the coated paper will not keep well enough to be sent as far as this, and that Mr. Willis has told me (writing about the beginning of 1889) that, although the paper could be coated perfectly by machinery, he had not yet been able to completely overcome the difficulties of coating it by hand, so that there was no use of sending out the materials. I have, on the other hand, seen lately a great deal of the working of the old "hot bath" process, and, to tell the truth, do not want anything much better. The materials have been sent out here, and the paper has been coated as it was wanted. The result of experience in the coating of the paper is that I should recommend all who work on any but the very smallest scale to coat their own paper. There is no need for me minutely to describe the process, as it is so fully and lucidly described in the printed instructions sent out by the Platinotype Company. It consists in evenly coating the surface of the paper, laid, by preference, on a sheet of plate glass, by sponging over it a mixture of iron and platinum salts made up immediately before they are wanted, allowing the sheet to get nearly surface dry, and then rapidly drying by the aid of heat. A little manipulative dexterity is needed in spreading the solution, but it is very soon acquired, and there are great advantages in preparing the paper just as it is needed. Platinotype paper will sometimes keep well for a long time. I do not know for how long, but certainly for some months, but there appears to be some uncertainty in the matter, and there can be no doubt that better all-round work will result by using only freshly prepared paper.

I do not think that the dampness in England is ever so great as to make platinotype work, including the coating of the paper, impossible. Indeed, it is not right to say that even here, where the dampness is sometimes excessive, and is accompanied by great heat, it is ever absolutely impossible to work the process, but we came to the conclusion that, as it was very difficult to get uniformly good work when the weather was both hot and damp, it would be better not to attempt to work at all at such times, and I should certainly

advise the amateur who never needs to work continuously, and who can generally, more or less, choose his own time for doing any particular kind of work, to choose fine, dry, and temperate days for platinotype work. In such weather he ought to be able, coating his own paper as he needs it, to turn out work of uniformly excellent quality with a percentage of failure little, if at all, greater than in ordinary silver printing. The negatives must not be very thin, but need not be denser than is necessary to give a *vigorous* silver print. The main requisite is that the gradation, or, as I believe artists call it, the "tonality," be good.

MATT SURFACES FOR PHOTOGRAPHIC PRINTS IN GENERAL.

I think that as much credit is due to Willis and the Platinotype Company for the way in which they have educated the public taste, in making them appreciate a matt surface and a delicate black for photographs, as for anything else. It has already been remarked, in one of the photographic journals, how that, when first platinotype was introduced, the objection to it was the "dull" surface and the black colour, and that the generally expressed desire was that it should be made to yield a photograph more nearly resembling the common silver print on albumenized paper; but how that, some years ago, when the Eastman Company introduced a quality of gelatino-bromide paper that gave prints with a perfectly matt surface, it was, by many, chiefly admired because it would give prints *indistinguishable from platinotype prints*. Now the undoubted superiority of a matt surface artistically, is almost universally recognised, and, even in the case of silver printing, there is a tendency to give up the gloss of albumen. This is, I think, a thing to rejoice over. Not only is any gloss objectionable, but the material generally used to produce it, namely albumen, undoubtedly militates against the stability of silver prints, never, I fear, things that can be looked on as really permanent.

The chief difficulty in working the silver printing process on matt-surface paper is that, with the comparatively thin negatives that are common in these days, there is difficulty in getting anything but very dull prints. Greater density of negative is needed than when the paper is albumenized. This difficulty is, in great measure, overcome by using the "ammonia-nitrate" process, which gives more brilliant prints than the ordinary process with a neutral bath. Probably most of your readers are familiar with the ammonia-nitrate process, but I give a brief description of it, as some probably are not.

THE AMMONIA-NITRATE PROCESS OF SILVER PRINTING.

The paper generally used is "Saxe," but any very pure paper may be used. Very beautiful results can be got with the finer qualities of Japanese paper, but it is rather difficult to work. It is very tough when *dry*, but becomes very soft and unmanageable when soaked in water. For large work exceedingly artistic pictures will be got by using Whatman's drawing paper.

Salting Bath.

Chloride of ammonium	60 grs.
Gelatine (any fairly pure sample)	30 "
Water	20 ozs.

The paper is soaked in this till it has quite expanded, and is then dried, preferably without the aid of heat.

To make the sensitizing solution, we may take 1 oz. of silver nitrate, and dissolve it in 5 ozs. water. We then divide the solution into two equal parts, and to one of them add strong ammonia till the dark precipitate first formed is redissolved. The solution is then divided into two equal parts,

* NOTE.—This fact is fully borne out by experience of the writer, who possessed one of these metal tripods. On one occasion the legs could not be unscrewed, although some exceptionally strong looking labouring men tried their hands at the work. The tripod had therefore to be carried home in its extended form, and was the source of considerable annoyance. Its stability was also inferior to the cheapest and most common wooden article.

and to one there is added a drop or two of litmus solution,* enough to make the silver solution distinctly blue. Nitric acid is then cautiously added till the colour is changed to red. The two portions of the solution are now added together, and the bulk is made up to 10 ozs. with water. This is the sensitizing solution, and to sensitize the paper it must be brushed over the surface. A sheet of paper is laid on a clean board, or better, a sheet of plate glass. The board is inclined a little, and the solution is brushed over the paper with a broad soft brush, or a cotton-wool pad, beginning at the upper edge and working downwards in broad sweeps, then tilting the board so that the direction of the inclination is at right angles to what it was before, and working down again in the same way, the second sweeps, of course, crossing the first. The paper is laid face upwards on one side for a few seconds to allow the liquid to soak into it, and then the sensitizing is repeated a second time.

The paper is next dried, a gentle heat being used if it be thought fit to hasten the process; it is then printed and toned in the usual way.

The paper keeps badly, and must therefore be sensitized, printed, and toned all on the same day. It will keep indefinitely after salting, but before sensitizing.

The trouble of working this process is, undoubtedly, considerable, but is, I think, amply repaid by the beautiful results.

I have described this process much more fully in my "Practical Guide to Photographic and Photo-Mechanical Printing Processes," published by Marion & Co., the formulæ being taken from Hardwich, but I have since found that I get better results with a larger quantity of gelatine than is there recommended. I, moreover, consider the strength of silver solution according to Hardwich's formula unnecessarily great. As regards gelatine, I have, indeed, used two, or even three times as much as that recommended above, and that without getting any objectionable gloss, and with, I think, some increase in the brilliancy of the resulting prints.

(To be continued.)

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

SIR GEORGE PRESCOTT presided at the meeting of the Camera Club on Thursday evening, the 9th instant.

The great business of the evening was the reading of a paper by Mr. Walker, of the Eastman Company, on the new transparent celluloid film for use in the roller slide. And truly the matter is one of the greatest possible importance to amateurs generally, but more especially to those who propose to take their holidays abroad far from the haunts of the seller of plates of English sizes, and who yet objects to carrying several dozen of plates about with him, a matter of some importance when long journeys on foot have to be made. It may be said that it is not absolutely necessary to take a large number of plates, because half-a-dozen good pictures are better than several dozen indifferent ones. We quite agree, but it must be remembered that, after all is said and done, it is only the few who can make sure of the half-dozen good negatives from half-a-dozen plates, and those ill-fated amateurs who are almost compelled to take several shots to get one good one must be provided for.

However, as Mr. Walker pointed out, the advent of the flexible celluloid film marks the commencement of a new era, the end of

which no man can foresee. Great objections were raised to the Eastman stripping films when they were introduced, and people found all kinds of difficulties in their manipulation, but he had constantly pointed out to them that the difficulty was almost nothing when the printed directions were rigidly adhered to. The consequence of this fact being persistently pointed out was that many persons, who previously had apparently been trying to find out everything they should not do, followed the instructions and were successful. At the present time Messrs. Eastman were developing and stripping films at the rate of 25,000 a week, and the work was done by lads under sixteen, who had had no previous experience of manipulation, and only one demonstration of what was necessary to be done. Most of the results were fairly good printing negatives. Mr. W. K. Burton had admitted that he could do nothing with the films till he followed the instructions, and then he succeeded. With regard to the new film, Mr. Eastman felt that a proper and good roller slide for it was a *sine quâ non*, and Mr. Walker enumerated about twenty-five of the points which were required in such a slide, and which he claimed that the Eastman slide practically contained. The new film did not require exceptionally delicate treatment, but cut rolls were never recommended except for single exposures with small stops, as no device had yet been discovered which would hold such a film perfectly flat in the focal plane. The old pattern of roller slide would carry the film, all that was necessary being the loosening of the tension spring, which could be done with a pocket knife. Nothing could be simpler than the development of the film, as it lay flat at the bottom of the dish, and very little solution was necessary to cover it. But with regard to such sizes as 10 by 8, strips were provided at the side of the dish which would hold the film flat. The development might be by any approved formula, though they recommended their own, and the only expedient they had found necessary for drying was to hang the film up by pins stuck through two corners. He would strongly advise them not to use the glycerine bath in this country, where there was such a damp climate, though in drier countries there might be no objection. He showed some specimen negatives (very good ones) which had travelled about through many countries with little effect upon themselves. In some of the films there had been found markings which appeared to be due to an electrical discharge, having the appearance of spots from which tree-like forms radiated; and in others there was what appeared to be a kind of lap in the emulsion, though it was not a lap. Both of these, it was hoped, would be obviated at an early date. In conclusion, he hoped that the members of the Camera Club would help by their criticisms and experiments to find the cause of any defects and their cure.

Mr. Francis Cobb expressed disappointment that Mr. Walker had not shown them a 10 by 8 negative on the film. He was afraid that there would be some difficulty in making so large a film lie flat in the camera. Dr. Lindsay Johnson showed a specimen of some celluloid which he had made which was free from the markings which were to be found on the Eastman film. He did not think, however, those marks would matter for ordinary work, though they might not be good for microscopic or astronomical work and for big enlargements. Mr. Rodgers spoke well of the film so far as his experience went. He made some exposures on the previous Saturday, which was a vile day, and the results were, under the circumstances, good. The film was not particularly suitable for hydroquinone, but he never could develop well with hydroquinone. With the pyro and soda developer he succeeded very well, and he was perfectly satisfied with the film. He had found the tree on some of his negatives, on three out of eleven.

Mr. Shipton made his exposures on Monday, which was a worse day for the purpose than Saturday, but he also got negatives which spoke well for the film, although he thought the film would not lie quite so flat in the whole-plate size as did the old stripping film. He also had found the curious tree-like markings on some of the negatives. Could not the manufacturers locate the lap, so that the portion of the film containing it could be avoided? There was no doubt the Company were working on the right lines, and it would be astonishing if they had got a perfect article at once. Mr. Sturme, who tried a 10 by 8 roller, did not find any undue cockling, and Mr. Corbould pointed out that pinning by the four corners prevents curling during drying. Dr. Patterson raised a very important point when he asked if the

* It is commonly directed that litmus paper be used. I, however, prefer, whenever the presence of the small quantity of litmus solution will do no harm, to test for acidity by the addition of it to the liquid to be tested. The test is then much more easily done, and is more delicate.

films would retain their flexibility after they had been on the roller for some time.

Mr. Lyonel Clark found the film very rapid, though he used it on a worse day than either of those which had been mentioned. He had come to the conclusion that the tree-like markings were due to an electrical discharge caused by the friction of the emulsion on the celluloid in the rapid unwinding of the film, and had secured immunity therefrom by unwinding slowly. The film was as clear as they could desire for ordinary purposes, and was as easy to develop as a dry plate. He would like to see something in the nature of a double-back to carry two films, for the purpose of those who worked in their back gardens and other artistic places, and only made a few exposures.

Mr. Pringle, who had not yet developed his exposures of the film, also strongly deprecated the use of glycerine, whilst Mr. Bourne suggested that the markings were due to an incipient fungus.

Mr. Walker expressed himself highly gratified at the kindly criticisms which had been made upon the film, and said that Mr. Eastman, for reasons best known to himself, had decided not yet to make a larger size than 10 by 8. A brush was also a good thing to use for development on the grounds of economy and cleanliness. He most emphatically disclaimed any part in the invention, which he said was entirely due to Mr. Eastman and Mr. Reisenbach. They were proposing to put automatic recorders and locking apparatus to some of the slides. He did not know whether there was any lack of permanent flexibility, but did not think Mr. Eastman would have put the film on the market if there were. He would like to see a film carrier for the film, but did not see how it was to be done, when he remembered how the dimensions of the backs varied.

The meeting concluded with a vote of thanks to Mr. Walker for his paper.

The subject for Thursday, January 23rd, is "English Church Architecture as a Subject for Photography," when a paper will be read by the Rev. T. Perkins, M.A.

Our Contemporaries at Home and Abroad.

ANTHONY'S *Photographic Bulletin* (New York), in its editorials, says, "Perhaps one of the oldest amateur photographers in America is ex-Judge Dobbin, of Baltimore, who has just passed his eightieth birthday, and is as enthusiastic about it as the youngest member of the Baltimore Club. He has been interested in the art from the earliest days of the daguerreotype." There are articles on the "Semi-centennial of Photography, by the Photographic Association of Brooklyn;" "Photographic Exhibition at the American Institute Fair;" "Mrs. Christmas," a story; "Action of Light on Silver Chloride," etc.

L'Amateur Photographique (Paris) concludes its review of the past year thus: "We shall endeavour, under all circumstances, to merit the support of our readers, and to justify more and more in their eyes our motto, which ought also to be theirs, 'Always do the best.'" The number contains the second lesson in "Photography and its Application to the Industrial Arts," a continuation of the article on "The Products and Customary Operations in Photography," "Transparencies in Prussian Blue," etc.

The *Beacon* (Chicago), in "Words from the Watch Tower," says, "Let me suggest a question as to the wisdom of giving so much rope to the egotistical meanderings of Dr. P. H. Emerson. Those who have read his book and know how he sneers at all the great names, both ancient and modern, who have brought art to the degree of perfection which it has reached, and that he esteems the ludicrous emanations of Whistler's brush worthy of all praise, will be able to truly estimate his ability, or rather inability, as a critic; but those who have not seen the book, and who are not aware of the laughing-stock he has made of himself in art circles, may be led to form a false impression of the works of the men he tries to belittle, not one of the latches of whose shoes, from an art point of view, he is worthy to untie." There are also articles on "How to Save your Waste," "The Optical Lantern" (continued), "Photo-mechanical Printing Methods" (continued), "Carbon Printing" (continued), etc.

The *British Journal of Photography*, in an article on "Advances in Pellicular Negatives," referring to the Eastman film, says,

"What the new claimant for public favour will in all probability do will be to kill the 'stripping film,' at least in its application to small-sized roll-holders, because of the immunity it confers in stripping the negative from off its supports after the development and fixing have been completed. Not that the operation of stripping a gelatine pellicle from a paper support is either difficult or uncertain, but still it involves a certain amount of trouble." Articles are given on "Oil Lanterns for Enlarging or Projection," "Instruments in 1889 for Celestial Photography," "The New Benzoline Limelight" (continued), "Platinotype Printing," "Remarks on the Autoglyphic or Half-tone Engraving Process," "Litho-Heliogravure," etc.

Bulletin de la Société Française de Photographie contains a report of the general meeting of the Society on the 6th December, preceded by a photogravure of M. Claude-Marie Ferrier; an article on "Development by Eikonogen," in which M. Leon Vidal says, "Eikonogen is a developer possessing considerable advantages, and it is more easy of manipulation, especially for the amateur, than the developers generally in use."

Inventions says, "Amongst new Yankee inventions is a photographic camera which has been devised by Mr. Geo. S. Moler, Ithaca, N.Y. This is a camera more especially designed for instantaneous work, in which provision is made for storing and manipulating for exposure a series of dry plates, whereby a succession of photographs may be taken with great rapidity, and the plates used in regular order if desired."

The *Photographic News*, dealing with the question of copyright, says, "The manufacture of as many negatives as possible in one day is the aim of the average portrait photographer, and if he wishes to increase his business, advertisements are not to be despised. We therefore contend that the advertising of a photographer's name in a newspaper is a *quid pro quo* in the cases we have in our mind, namely, where the portraits of nonentities are taken in the ordinary way of business, and the photographer has been already paid for making the negative." There are articles on "British Photographers and Foreign Fortifications," "The late Col. Russell's Contributions to Photography," "Repairing Broken Negatives," "The Progress of Quinol Development," "Photographing Lightning," "Photography in France," "Cold-Weather Notes," etc.

The *Photographic Review*, in an article on "Stereoscopic Photography," says, "We think that it is in views, interiors, and reproduction of works of sculpture, etc., that the revival of the stereoscope is, if anywhere, to be looked for. . . . At all events, if photographers, and especially amateurs, can be made alive to the beauty and advantage for many subjects of a stereoscopic representation, there is hope for a considerable revival of this too long neglected product of photography." There are some articles on "Printing on Rough Drawing Paper," "Vignetting Silver Prints," "Errors in Lenses as Affecting Definition," "Artificial Plate Marks," etc.

The *Photographic Times* (New York) contains a photogravure from a negative by Mrs. Jeanette M. Appleton, entitled "A Country Lane." It is a charming picture, and admirably reproduced. In its editorial notes, it says, "Before the Chemical Society of Washington, Mr. R. Hitchcock read an interesting paper upon a Japanese product which might be of use in photographic manipulations. 'Japanese lacquer,' obtained from a tree, *Rhus Vernicifera*, D. C. The chief substance we have to rely upon for our dishes and cabinet ware to protect them from damp or the penetration of water is shellac, but the lacquer in question appears to possess advantages not known in the use of the Indian product. Mr. Hitchcock states that it gives a surface to wood which is hard but not brittle; takes a polish not to be excelled and which lasts for centuries. It is proof against boiling water, alcohol, and, indeed, seems to be insoluble in any agent known. It is the best possible application for laboratory tables. He had had in use a set of photographer's developing trays for more than a year, and they were excellent and cheap. One drawback, that of being poisonous, will not go for much with photographers, we think." Articles: "Electric Light in Photography," "Photography from a Woman's Standpoint," "Preparation of the Positive Printing Bath," etc. Also index to the recently-completed volume.

Photography, in an article on "Printing Papers—Colour and Surface Quality," says, "We are aware that there are some who may not admit the impeachment of albumenised silver paper on the score of the displeasing colours it yields under gold toning, but that alone with us is quite sufficient to condemn it, without

any consideration of the still more reprehensible offence it pleads guilty to, namely, gloss—a point we shall refer to later on. Further, this unhappy paper, although it may show a very good curve for gradation, appears to give a very unnatural effect of light relations in most landscape pictures." Articles: "Enlargements at Exhibitions," "Printing in Silver on Thin Japanese Paper," etc.

THE *Scientific American* draws attention to an improved flash-light lamp, the invention of Dr. John J. Higgins. It is intended to burn alcohol or gas. The fact of discharging once prepares it for the next flash.

THE *Studio* (New York) has an article of some length on the question of "The Poverty of Millet," and includes therein a letter from Theodore Child to the *Sun* on the subject, which concludes, "In plain words, Millet's widow is quite able to take care of herself, and neither deserves nor appeals for pity, sympathy, or charity." The latter further states that she has an income of 1,200 dols. a-year, and only one child, a daughter, dependent upon her, all her other children providing well for themselves. The article says, "The fact that in the course of his life Millet received a considerable sum of money for the sale of his pictures, does not settle the matter. There were long gaps between the prosperous times, and too often the lean kine ate up the fat kine, the years of moderate plenty had to pay for the years of privation." There are also interesting articles on the exhibitions of the Salmagundi Club and the Architectural League, and on the American pictures at the Paris Exhibition.

Societies' Meetings.

BATH PHOT. SOC:—A meeting was held on Wednesday, January 8th, Mr. Pumphrey, President, in the chair. The minutes having been read, and presentations and other announcements made, the Chairman welcomed Mr. H. Summer Gates, Hon. Secretary, Cambridge Camera Club, U.S. Mr. Gates returned thanks in suitable terms, and said he had considerable experience with magnesium flash-light work in America. As a rule they worked a larger flame than here, and more metal was burnt, but the light so obtained was diffused through a screen, which softened the deep shadows. He would send prints for the members to see. The Hon. Secretary, W. Middleton Ashmead, drew attention to a series of large carbon photographs of various tints (same subject, "Mary Anderson") and several other of the Autotype Company's productions, lent by Mr. Rosen. The Chairman said it was desired he should make a few remarks on flash-light photography before the proposed experiments were made. He regarded the process as the complement to instantaneous photography, but reverse as to method. In the one, closing the camera rapidly was a *sine qua non*, in the other the light commences and ceases with an instantaneous flash. Such a light we find in the combustion of the metal magnesium. The old form of thin ribbon of metal gives a powerful light almost from a point, and deep shadows then become a trouble; but by spreading the powdered metal over a large surface, such as a spirit flame, a broad expanse of light is emitted. Several cameras were then arranged in line, the President and others volunteered to be photographed, and a good many charges of magnesium were consumed. The apparatus, which belonged to Mr. Spurge, was manipulated by that gentleman, and several negatives were developed and shown to a large and appreciative audience.

BIRMINGHAM PHOT. SOC:—Ordinary meeting held at the club rooms, Grand Hotel, Birmingham, Mr. E. Howard Jaques, Vice-President, in the chair. The Chairman said that the Council had decided to give an order to Mr. Place for a club lantern, at a cost not exceeding thirty guineas, and that the annual exhibition would be opened to the public on Tuesday and Wednesday, the 21st and 22nd inst., at the Temperance Hall, Temple Street, the price of admission to non-members being fixed at sixpence each. Mr. H. J. Aubrey was elected a member. Mr. C. J. Fowler then gave his paper, "Notes on the Summer Excursions," which was illustrated by a large number of lantern slides made from the negatives taken by members. The excursions were to Yardley Wood, Dudley Castle, Colleshill, Berkswell, Warwick, Shakespearian villages, Worcester, Dovedale, etc. The following gentlemen, besides the lecturer, contributed their

quota of slides: Messrs. Middleton, Pickard, Manley, Longmore, Griffiths, Southall, and Leeson. Mr. W. J. Harrison threw some pictures on the screen which were made on celluloid film. This, we believe, is the first time the new film has been publicly exhibited.

DARLINGTON PHOT. SOC:—The usual monthly meeting of this Society was held on the 13th inst. Mr. E. Ensor presided. Mr. L. W. Williamson was elected a member of the Society. An exhibition of lantern slides executed by the members was given. Over 120 slides were shown, many of which possessed considerable merit.

DEVON AND CORNWALL CAMERA CLUB.—The Devon and Cornwall Camera Club held their first lantern-slide competition on Monday, 16th Dec., at the Club Rooms, Athenæum, Plymouth. Mr. R. Murray took the chair, and the Hon. Treasurer took charge of the club lantern. A numerous and varied assortment of lantern slides was then shown in rapid succession; and on examination of the voting papers at the close, it was found that Mrs. Carnell had been awarded first prize with sixty-one votes; Mr. R. Murray taking the second prize with forty votes. A large proportion of the lantern slides shown were heartily approved. Mrs. Carnell's "Breaking Waves" and Mr. Murray's "Snow Scenes" were especially worthy of mention. Messrs. Worth's "Colley," Tweedy's "Old Boat," Burnard's "Woodland Scene," Micklewood's "Huckworthy Bridge," Dr. Aldridge's "Falls of Don," and a "group" by Miss Keen, also received commendation. A number of slides (not for competition) made by Mrs. Carnell, Messrs. Micklewood, Murray, and others, were afterwards shown, some being copies of "Leech's Sketches in *Punch*," creating great amusement. A very great general improvement in the quality of the work was noticed; and this was attributed to the attention paid to the lecture on lantern slides recently delivered before the members of the Club by Mr. A. Pringle, and by which it was evident that the members had largely benefited.

DEWSBURY AM. PHOT. SOC:—The annual meeting of the society was held on the 9th inst., under the presidency of Mr. T. G. Beaumont, when the report on the year's work and outings was read by the Secretary. The society is in a flourishing condition, and has a substantial balance in hand. The society has purchased a lantern by subscription, and slides were shown through it during the evening. Mr. T. G. Beaumont was elected President for the ensuing year, Mr. E. Scargill, Secretary, and Mr. Thornes, Treasurer. The usual votes of thanks to the outgoing officers were passed.

HACKNEY PHOT. SOC:—The usual meeting was held on January 9th, when Mr. Fred H. Evans read his paper on "Photo-Micrography," Dr. Gerard Smith, the President, in the chair. After pointing out its advantages, over a hundred slides were shown upon the screen, the most interesting being a series of very beautiful subjects taken with dark ground illumination, Foraminifera, Polycistina, wood sections, whole insects, coral-lines, Ectivus spine sections, etc. The physiological slides were also highly praised by medical members present as of special value. The specimens of insects and parts of insects were of unusual clearness and sharpness, which proved the efficiency of the lecturer. The formula used by Mr. Evans, of which he spoke most favourably, was a slight modification of one given by Mr. J. B. B. Wellington. The usual vote of thanks was accorded the lecturer. The Secretary announced that the society's first album was ready for inspection. This society is just seven months old, and has just one hundred members. Next meeting on 23rd inst.; Mr. F. W. Harton will read a paper on "Flash-Light Photography."

HARTLEPOOL AND DISTRICT AM. PHOT. SOC:—The ordinary monthly meeting was held in the society's rooms on the 9th instant, the Rev. J. Patterson in the chair. The subject of the evening's paper was "Enlargements on Eastman's Permanent Bromide Paper." The lecturer, Mr. H. M. Smith, of Huddersfield, afforded his audience a great treat by the able and instructive manner in which he dealt with the subject. The lights having been turned down, Mr. Smith gave a practical demonstration of the entire process, and proved himself as efficient in practice as in theory. In the discussion which followed, Mr. Smith attributed his success to the great attention he paid to what were called the small details of the process, and particularly impressed upon his hearers the necessity of the greatest attention being paid to them. The new Kodak (No. 2) and specimens of negatives on the celluloid films were handed round, and the improvements and advantages explained. A most enjoyable

evening was brought to a close by a hearty and unanimous vote of thanks to Mr. Smith and the Eastman Company. The next being the general annual meeting, will be held on Tuesday, the 11th February, when the "Home Portraiture" pictures and slides, kindly promised by the proprietors of the AMATEUR PHOTOGRAPHER, will be exhibited.

LEWES PHOT: SOC:—The ordinary meeting was held on Jan. 7th, Mr. J. Tunks, Vice-President, in the chair. The balance-sheet of the Lewes and Sussex Photographic Exhibition was read, showing a balance in hand of £0 16s. 1d., and adopted. At the conclusion of the usual business, the remainder of the evening was devoted to the making of lantern slides by contact; slides being exposed and developed by Mr. A. H. Webbing and the Hon. Secretary. At the conclusion a vote of thanks was passed to them for their demonstration. It has been arranged to offer certificates for competition amongst the members, once a quarter, for various subjects. The first competition will be for lantern transparencies.

NORTH LONDON PHOT: SOC:—The usual meeting was held on January 7th, Mr. F. Medland in the chair. The Chairman showed a negative which had the appearance of having been frosted on the gelatine side. It was suggested that the negative had been intensified with bichloride of mercury, which had been some time at rest. Mr. Medland said several other negatives had been treated in exactly the same way afterwards, and in the same intensifier, and showed no such marks. Mr. Hudson suggested that the bichloride had been warm, and that the action of the cold air upon the plate had formed the crystals. Mr. Medland then passed round a very useful cutting shape which he had made, and by use of which he was enabled to cut lantern slide masks of various sizes. He stated that the cutter had been made for him by Newman's. An interesting and successful exhibition of lantern slides by the members then took place. The Secretary reported that the Council were making arrangements to hold a conversazione in connection with the annual exhibition of members' work, to be held at Northampton House, on Tuesday, March 4th. Members are requested to send their work to Northampton House, Paul's Road, at least a week before that date, directed to the Secretary. The next meeting of the society will be on January 21st, when Mr. A. Mackie will give a demonstration on "Collodio-Bromide, its Manufacture and Uses."

OLDHAM PHOT: SOC:—The annual soiree and dance in connection with the above society took place on Thursday, the 9th inst., in the rooms of the Oldham Lyceum. Conveyances began to arrive shortly after six, and at seven o'clock close on seventy members and friends sat down to an excellent "spread." An adjournment was made to the club-room, where dancing was indulged in, and at ten o'clock the first lantern display was given in the chess-room downstairs, a splendid set of slides, illustrating "Paris and its Exhibition," having been expressly sent for exhibition by Messrs. York and Son, of London—several of the Eiffel Tower being extremely interesting. Songs were given at intervals by Misses M. Bardsley and L. Lawton, and Messrs. J. J. Bailey, W. Beaumont, and J. H. Mills. The second lantern interval took place about twelve o'clock, and consisted of the exhibition of transparencies by the following members:—Messrs. Bailey, Fullalove, Hall, Nash, Thompson, and Widdop. Dancing was kept up until shortly after two, when the company began to disperse, all expressing themselves well pleased with the arrangements and the variety of the entertainment.

SHEFFIELD PHOT: SOC:—The ordinary meeting of the above Society was held at the Masonic Hall, Surrey Street, on Tuesday evening, January 7th, Mr. B. J. Taylor in the chair. It was proposed by Mr. Councillor Thomas Firth and seconded by Mr. B. Nowill, that a Lantern Exhibition be held early in February, in aid of the Public Hospital and Dispensary's contemplated alterations, which was unanimously agreed to. Mr. Preston gave a practical demonstration, showing the different lights for the optical lantern, viz., the three-wick lamp with Luxor oil, the oxy-hydrogen, and the ethero-oxygen. The two latter were thought to be about equal in brilliancy, the oxy-hydrogen the best for safety, and the ethero-oxygen the most convenient for giving exhibitions in country villages, where the ordinary gas is not to be had. The AMATEUR PHOTOGRAPHER'S Prize Competitive Pictures in the Animal Life Competition, "Inland" and "Hayfield" scenes, and "Seaside Work," were laid upon the table and fully appreciated by the members, and after the usual votes of thanks, the meeting terminated.

STOCKPORT PHOT: SOC:—The usual monthly meeting was held at the society's rooms, St. Petersgate, on Wednesday evening in last week; the Hon. Treasurer, Mr. F. Brooke, in the chair. Mr. W. T. Wilkinson gave a demonstration on "Carbon Printing." He explained how carbon tissue was prepared, and the chemical principles involved in printing it. Mr. Wilkinson then developed, stripped, and fixed some of these tissues, which were afterwards passed round for examination, and were greatly admired, the half-tones being very beautiful, the prints leaving nothing to be desired. Mr. H. Cooper then gave a demonstration on "Bromide Enlarging," by an ordinary optical lantern, on both slow and rapid Ilford paper, using both ferrous oxalate and hydroquinone developers. The society being young, and the subscription only 3s. per annum, it does not possess a lantern. Mr. Hilderley proposed that the funds for purchasing a lantern should be raised by shares, the shares to be repaid as the society became richer. This was taken up with enthusiasm, and sufficient shares were then taken to enable the society to purchase a lantern at once. Mr. W. Jennison passed round a number of platinotype prints. A hearty vote of thanks passed to Mr. W. T. Wilkinson and Mr. Cooper for their demonstrations concluded a very pleasant evening. The next meeting will be held on February 8th.

TUNBRIDGE WELLS AM: PHOT: SOC:—The annual meeting of the above association was held in the Mechanics' Institute, on Thursday evening, the 9th inst., the President being in the chair. The Hon. Secretary presented a report for the last year, and the President presented to the successful members the medals gained at the exhibition. The officers were elected for the ensuing year. Mr. Howard showed one of Beck's new cameras, "Pecrops," which was critically examined, and much commented on for its novel arrangement and well finished appearance. *Scraps* was distributed, as also a printed description of Mawson and Swan's Giah detective camera. Mr. Cassingham showed some excellent lantern slides, which were kindly lent by the Ilford Company. A letter was read by the Hon. Secretary from the Camera Club, inviting the association to nominate a representative to attend the 1890 Camera Club Conference, the President promising, if possible, to attend. A hearty vote of thanks to the Chairman closed the meeting.

WOLVERHAMPTON AM: PHOT: SOC:—The monthly meeting of this society was held on Tuesday evening, January 7th, at the society's rooms, Agricultural Hall. Mr. W. Ratcliffe occupied the chair. A very interesting collection of prints, sent for the occasion by the proprietors of *Photography*, was exhibited, and afforded much pleasure to the meeting. The set, taken as a whole, showed some good work, and to members no small instruction as to what is best suited for hand-camera work. Several members intend taken up this branch of photography during the coming season. Mr. G. Thomas read a paper on "The Use and Abuse of the Magic Lantern." The lecturer gave the history of the lantern from the 17th century, when invented by Kircher, down to the present time, and introduced one or two amusing stories of his own experiences. At the close of the lecture, slides were placed through the lantern by Messrs. E. Pratt, H. M. Lord, H. J. Wright, and the Secretary (J. N. Evans). The usual vote of thanks to the lecturer and Chairman concluded a very pleasant evening.

YORK PHOT: SOC:—The members of this society had an exceedingly pleasant meeting on Tuesday, the 7th inst., when, through the kindness of the Paisley Society, a set of fifty lantern slides, all of which were of great beauty, were shown. Copies of several catalogues and papers which had been received were laid on the table, and the thanks of the society accorded to Messrs. Piper and Carter for their gift of a copy of "The Year Book."

CORRECTION—PRINTING IN CARBON.—In letter, on page 20: for "from half-plate, portraits," read "four half-plate portraits."

"THE MAGIC LANTERN, ITS CONSTRUCTION AND USE," is the name of a convenient little handbook published by Messrs. Perken, Son, and Rayment, which, though not so exhaustive as Mr. Hepworth's "Book of the Lantern," is still a useful little brochure. It deals with the subject of single lanterns with oil lamps, of the lime light and method of making oxygen, of bi- and tri-lanterns, and the making and colouring of slides. It also deals with the application of the spectroscope to the lantern, and with the aphengescope. A beginner will find it a valuable help.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES

3368. **Halation.**—I use Ilford plates, and shall be glad to know how I can prevent negatives of interiors from blurring round the window lights. I understand that coating the backs with some composition will do, but have been unable to find any mention of it in books on photography.—A. MAT. EUB.

3369. **Enlarging Camera.**—Can any reader give me any information about Lancaster's Mulum in Parvo camera, which enlarges up to 12 by 10? How is it used, such as focussing, exposing, etc.?—BEGINNER.

3370. **Condenser.**—Will anyone kindly inform me on the following points:—(1) Can a really efficient condenser for enlarging purposes be made out of clock glasses cemented to flat glass and filled with glycerine; (2) how are the filling apertures managed; (3) what is the best way to mount them; (4) where can I obtain glass discs to use in making them? Any information about making will be thankfully received.—TREBLE X.

3371. **Covering Power of Lens.**—I have a whole-plate portrait lens fitted to a 10 by 8 enlarging camera. To get my sitter well focussed I have to bring my camera about 2 ft. from the sitter. Can any reader assist me? Is my camera too long?—PIVOT.

3372. **Enlarging.**—I have a 10 by 8 enlarging camera. Can any reader tell me how to enlarge finished photographs with the same?—PIVOT.

3373. **Mounting Prints.**—Will anyone tell me if they have succeeded in mounting prints with a high gloss by the process described in Wall's "Dictionary of Photography," page 124? I have tried repeatedly and carefully, and have always failed. My prints either refuse to adhere to the mount altogether, or they only stick in the centre. I dry them by a fire, finding that they otherwise remain firmly fixed on to the glass.—ELIZABETH.

3374. **Platinum v. Gold.**—I should be glad if one of your readers competent to do so would answer (not necessarily criticise) my questions under this head in No. 3338. I can dispense with the opinion of your correspondent (I forget his initials) who seemed to find some of them not to his mind.—G. M. S.

3375. **Model Camera.**—Is the Model camera, described in the **AMATEUR PHOTOGRAPHER** for 13th December last, yet for sale, and by whom?—N.

3376. **Magnifying Lantern Slides.**—At page 175 of the "Photographic News Year-Book" there is described an instrument for magnifying lantern slides. Can any reader kindly tell me where such an instrument can be obtained, or give me the address of Mr. R. H. Bow, C.E., through the columns of the **AMATEUR PHOTOGRAPHER**?—T. C. W.

3377. **Detective Cameras.**—Can some reader recommend me a thoroughly good detective camera? I want one with as few projections as possible, and one in which the plates are changed automatically from outside.—DETECTOR.

3378. **Depth of Focus.**—Can any reader tell me if there is any way of finding depth of focus of an unmounted lens?—DETECTOR.

3379. **Fallowfield's Facile Camera.**—Will any of your readers, who have had experience of and used the Facile detective camera, kindly tell me their candid opinion about its virtues and also short-

comings? I am very anxious to purchase a half-plate detective camera, and have heard of and read so much in favour of the Facile that I am greatly tempted to order one, but not if I can hear of anything even better. I shall be greatly obliged if a fellow amateur will help me to become acquainted with one.—CAPTAIN.

3380. **Transparencies, Painting of.**—Is it possible to paint photograph transparencies (for magic lanterns)? If so, would some one kindly give me directions?—J. S. B.

3381. **Camera on Bicycle.**—Can any cyclist photographer kindly give particulars of carrier and tripod suitable for carrying a quarter-plate Instantograph on a new rapid Safety bicycle? Also whether a cycle clip would answer instead of a tripod? Any information on the subject will be gladly received by—C. T. C.

QUERIES UNANSWERED.

Dec. 6th.—Nos. 3274, 3277, 3283, 3284, 3283, 3289, 3290, 3291, 3293.

13th.—Nos. 3297, 3298, 3300, 3302, 3304, 3305, 3306, 3307, 3312, 3314.

20th.—Nos. 3318, 3319, 3321, 3324, 3325.

27th.—Nos. 3330, 3332.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3351, 3352, 3353, 3354, 3356, 3357, 3358, 3359, 3360, 3361, 3364, 3365, 3367.

ANSWERS.

3329. **Developer for Foreign Travel.**—"Vectis" should read the correspondence which appeared in the **AMATEUR PHOTOGRAPHER** of about May 10th, where several developers are spoken of. Why could not "Vectis" take out the usual 10 per cent. solutions of pyro, bromide, or ammonia?—SCILLIAN.

3329. **Developer for Foreign Travel.**—You don't mention the plates you use, and, of course, some developers suit some plates, while others don't. If you use the Ilford, the best developer would be the pyro, which you will find is a very quick developer, but stains dreadfully. If you use Fry's plates, I should recommend hydroquinone. But it is rather difficult to state, as you don't mention your plates.—J. H. MONTAGU.

3341. **Criticising Photographs.**—There is a Postal Photographic Society for the circulation, criticism, and exchange of prints taken by the members. The Secretary is W. M. Baylis, 4, Middle Temple Lane, London.—SCILLIAN.

3355. **Gelatine.**—The bichromates of ammonium and sodium, as well as tannin and chrome alum, will render gelatine insoluble in water after exposure to light. Ordinary alum does not render it insoluble, but raises the melting point.—SCILLIAN.

3362. **Ten Per Cent. Solution.**—To make an almost exact 10 per cent. solution of pyro, dissolve 1 oz. (avoid drops) of pyro and 4 ozs. of sodium sulphite in about 1 oz. of water, and make up to 9 ozs. with water. The solution should be made slightly acid, as alkaline solutions of pyro deteriorate very quickly. Of course, distilled water is better than ordinary tap water, but it is not absolutely necessary when sulphite is used.—SCILLIAN.

3363. **Negative Varnish Formula.**—Take shellac 2 ozs., and dissolve with shaking at intervals in 20 ozs. methylated spirit. When all is dissolved, add 1 oz. of finely-powdered chalk or whitening to clear it. All to stand for two or three days. If not perfectly clear, filter through a paper funnel with a tuft of cotton wool inserted in the point. Soak the wool first in methylated spirit.—SCILLIAN.

3365. **Water Condenser.**—These glasses are very scarce, but can be obtained at Mr. Cohen's, near Lever Street, in Goswell Road, E.C.—H. S. LARGE.

3365. **Water Condenser.**—I obtained 8 in. convex glasses (clock faces) from Plattsner Bros., Victoria Street, Bristol, for 7d. each. They keep stock up to 12 ins. diameter. Particulars as to making these condensers are given in **AMATEUR PHOTOGRAPHER** for January 3rd, in T. O. Hepworth's article on lantern-slide making.—J. J. T.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT:

NOVICE.—(1) Both lenses which you name are good, and you must exercise your own judgment in the adoption of one or the other. Possibly some friend who has one of these would let you try it, in order that you may see whether it comes up to your expectations. (2) The term "60 times" is an arbitrary one, and is very misleading. It means that plates so labelled are 60 times more rapid than the old wet process, but as the rapidity of plates prepared by the old process could, under certain conditions, be increased sufficiently to afford instantaneous effects, the comparison is a somewhat foolish one. (3) In the brightest light and for open

country or seascape, no exposure would be too rapid whatever the compilers of tables may say.

J. C. CORNWALL.—Your pictures are delightful, and full of life and vigour. The dull foggy city from which we write forms a melancholy contrast to them.

ARGOSY.—You have certainly no right to produce lantern slides from a photograph marked "copyright," and would by doing so lay yourself open to an action at law. We believe that a copyright extends for forty-two years. Thanks for good wishes. Our publishers have nothing to do with the publication named. Will try and procure it for you. With regard to exposure for copying, you can only decide the matter by trial.

G. B.—We prefer A of the two lenses named. The camera should have a swing-back, and is better for the other movements named, but the latter are not of the same importance as the former.

ARTEMUS.—Your lens, perhaps, fetched £7 in Pre-Adamite times, but it is certainly worth a great deal less now. It is apparently an experimental affair. The position of the diaphragm, of course, cuts off the image. It may be useful for portraiture, and should be confined to that employment. You might try the effect of inserting cardboard diaphragms between the lenses, and if you find any jam thereby, it might be worth while to have a slit cut for their insertion in the usual manner.

W. G. G.—(1) We are sorry to say your negatives and prints have been mislaid. They shall be now put aside for your messenger whenever he may come. (2) The idea of opening the dark slide within the camera has been patented more than once, but does not seem to have commended itself to the trade.

ALFRED STIEGLITZ (Berlin).—We have reproduced your photograph "Meditation." Our publishers have attended to your kind order.

REV. W. BENNETT.—Your communication has received attention by post.

D. E.—The lens B is a very perfect instrument, and we have every faith in C.

CAUL ULRICH (Vienna).—Thank you very much; we will write you when next requiring some special illustrations.

CHEAP PLATES.—We have received the name and address, and have written to the person named.

THOS. L. BUCK.—(1) We will consider your suggestion. (2) Opinions differ. Note reference this week in "Our Views." (3) The prints cannot be entered for both competitions. (4) When you please. (5) Due announcement will be made. We should consider the photographs you name certainly come under "Figure Studies." Many thanks for your kind compliments.

PAT.—We do not know the gentleman. Why not write to him under cover to the editor of the "Almanac"?

G. H. BEDFORD.—Programme to hand.

W. OWENS.—Will write you a little later on.

J. R. D.—Both over-exposed. You do not say what plate or developer you used. The point of view in each picture is well chosen. The prints are flat, but you have a good idea of a picture.

W. W. PARKINSON.—If you want a reliable cheap lens have No. 5, which will work at f/6, and is a thoroughly good piece of apparatus.

J. R. MARTIN.—Very pleased the prints gave such satisfaction. "Enlargements" are a splendid lot. If you require them you must make early application.

FRANK LONG.—Your question is not intelligible, and you give no address.

H.—If you have "stuck to a certain plate," why should you change? No. 4 is a splendid plate and cannot be surpassed. No 2 is a thoroughly dependable cheap plate.

A. READ.—We cannot advise you to use No. 1, and have had no experience with No. 2. Why not give us a call some Tuesday?

W. L. WILKINSON.—Thank you. May be glad of your services.

B. S. HARPER.—We cannot publish the name. The plate you mention has most excellent qualities, and can be procured from almost any photographic dealer. We do not know the maker's address.

E. G. RICHARDSON.—Probably due to excess of ammonia.

W. O. BLACKETT.—The conditions must be complied with, therefore we presume we shall not have you as a competitor. The photograph sent sadly lacks definition, and has no artistic merit.

E. O. W. L.—We have a high opinion of the usefulness of the hand camera named.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less, and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop,

or words, counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," complete, from 1st January, 1888, to November, 1889; price 10s.—Hughes, 3, Colville Gardens, Bayswater, London.

Backgrounds.—Exterior and interior backgrounds.—Harris, Chacewater, Cornwall.

Background and Camera.—Quarter detective camera, only 38s.; interior background, 8 by 7, 10s.—Tooth, Caldecott Street, Rugby.

Burnisher.—Burnisher (photographic) for sale, second-hand, cheap; 12s. 6d.—Address with Publishers.

Cameras.—Half-plate camera, reversing frame, swing-back, rising and cross fronts, two double dark-slides, good condition; cost £6 6s.; price £3.—B., No. 79, Highbury Hill, N.

Lancaster's Instantograph 1889, complete, scarcely used; offers cash only.—Taylor, Tannery, Maple.

Camera, etc.—Half-plate Instantograph camera, conical bellows, lens and shutter, one mahogany and three metal slides, two reversing backs and screens, in waterproof case, Optimus three-fold stand; set, complete, 85s.—E. Greenway, 18, Sandringham Road, Dalston, N.

Camera, Lenses, etc.—15 by 12 Optimus square long-extension brass-bound camera, three double backs, Ashford's latest tripod, Beck's R.R. and Dallmeyer's W.A.R. lenses for size larger plate, Thornton-Pickard shutter, cost over £50, Shew's half-plate hand-camera and lens, six double backs leather case, Hughes' enlarging lime-light lantern, extra-special lens for marginal definition, Brin's oxygen cylinder, to enlarge 10 by 8 and smaller negatives, cost over £30; the whole only used few times; what offers? seen by appointment.—Apply, C., care of House-keeper, 93, Bishopsgate Street Within, E.C.

Dark-Room Lamp, deep ruby glass; cost 5s. 8d.; price 2s. 10d.—No. 23, AMATEUR PHOTOGRAPHER Office.

Hand-Cameras.—Demon camera, three dark sheaths, lens, and silver watch, both warranted perfect order; 15s. 6d.—61, Gayhurst Road, Hackney.

Hand-camera, Rouch's Eureka 1888, best detective made, 3½ by 3½, equal to new; cost £5 10s.; price 50s.—T., 61, Arundel Street, Sheffield.

Lenses.—Will give a quarter-view lens, by Ross, for a Stieglitz's large-size circular camera.—B., 1, Kilburn Square, N.W.

Excellent cart lens, by Squire, perfect definition, with Waterhouse diaphragms; 25s.—Arthur Norman, St. Osyth, Colchester.

"Phot. Soc. Reporter" for 1889, complete. Cash offers to Casson, 57, The Grove, Bedford.

Printing Frames, etc.—Three Arundel and Marshall's quarter negative boxes, three good wood quarter printing frames, a Tylar metal quarter printing frame, pneumatic instantaneous shutter, a cabinet ebonite tray, a 10s. 6d. single wide-angle lens, a guinea wide-angle rectilinear lens, quarter retouching frame; 20s. the lot.—A. Gilder, Ivy Cottage, West Drayton, Middlesex.

Sets.—Half camera, three double dark-slides, tripod, and R.R. lens, all in good condition, £3 10s.; quarter camera and landscape lens, quite new, 30s.; Robinson's cabinet portrait lens, 38s.—R. Pigott, Capard, Rosellenis, Ireland.

Quarter portrait lens, working at f/4, 15s., good as new; also quarter camera, double extension, double movement front, reversing back, three double dark-slides, with rectilinear lens working at f/8, splendid definition; 63s.; or lens separate, 25s.; hardly used; deposit; approval.—A. Neale, Oakfield, Acock's Green.

Whole-plate camera and one double slide, new, cost £3, bargain 63s.; whole-plate lens, 15s.; and whole-plate tripod, 11s. 6d.—Slade, Slad Road, Stroud.

Watson and Sons' 8½ by 6½ new form Premier camera, brass-bound, with three double slides, solid leather case, and three-fold tripod, in perfect condition, almost new; cost £16 5s.; will take £10.—Apply, G.S., care of Watson and Sons, 313, High Holborn, W.C.

For sale, McKellen's whole-plate treble patent prize camera, all latest improvements, with two lenses, Ross R.R. and Dallmeyer's wide-angle, tripod and four dark-slides, in careful use four seasons, practically as good as new, whole contained in two waterproof bags, cost £31, will take £18; also London Stereoscopic half-plate camera, India set, all latest improvements, in leather case with lock, two lenses, the Company's R.R. and Wray's wide-angle, three dark-slides and tripod, bought in 1883, cost £18 4s.; will take £10.—Vicar, Aberannell, Garth, R.S.O., Breconshire.

Instantograph 1889, complete; 25s. 6d.; bargain; exchange.—Letters, George Howard, 55, Percival Street, Clerkenwell.

Sands and Hunter's Imperial half-plate camera, two double backs, view finder and case, perfectly new, £1; long-focus half-plate landscape lens, by Swift, £1.—Holm, 35, Elthiron Road, Fulham.

Lancaster's 1889 Instantograph half-plate, guaranteed genuine and in very finest order, double extension, leather bellows and reversing back, Instantograph lens and shutter, for views, portraits, etc., Iris stops, double slide, quarter carrier and stand, complete; approval; 74s.—Cousins, 5, Stanley Villa, Bruce Grove, Tottenham.

Camera, Furnival half-plate, all latest movements, three mahogany double backs, folding tripod, leather and canvas cases, etc.; bargain, £8.—C., 30, Brooke Road, Stoke Newington.

Camera, lens, and stand, quarter-plate, well-made swing-back, four dark-slides, price 25s.; rectilinear lens, price 7s.; lot 30s.—H., 27, Peel Bank Terrace, Church, Lancashire.

Set and "Amateur Photographer."—Quarter-plate camera (rack and pinion for focussing), R.R. lens, four double slides (cost 10s. each), by Stereoscopic Company, in excellent working order; £2 10s.; tripod if required; AMATEUR PHOTOGRAPHER for 1st two years in numbers; offers in cash; print on application.—Laurel Cottage, Heath, Leighton Buzzard.

Shutter.—Kershaw shutter, 2½ in. hood, cost 21s., and Cadett's ebonite time shutter, 2½ in. hood, cost 24s.; the two for 24s.; approval; deposit.—F. A. Graham, Albion Stores, Stockton-on-Tees.

Watch.—Watch, silver lever (maker, Benson, London), in going order; cost five guineas; accept 50s., or exchange half-plate camera, tripod, two double backs.—H. K., 171, Caledonian Road, London.

WANTED.

Background.—Empire background, about 7 by 5, mounted or unmounted (interior), cheap, cash.—F. Sharpe, Oakham.

Cameras.—Studio camera, cheap.—Thornton, 43, Walton Street, Chelsea.

Hockin's invisible detective camera.—S., 10, Burton Crescent, W.C.

Camera, Lens, etc.—Good half-plate camera, R.R. lens, photographic accessories, good lantern lamp; exchange lantern and slides, cost £11.—Greaves, Photographer, Heyside, Oldham.

Lantern.—Thoroughly good portable single lantern, fitted with good lenses, to show good 8 ft. picture.—Send full particulars and lowest price to Gem, 13, Greenside, Kendal.

Lenses.—Good whole-plate rapid rectilinear lens; exchange good violin, value £5.—D. J. McNeillie, Stratford-on-Avon.

Good lenses, very cheap for cash, or good exchange.—John Slade, Slad Road, Stroud.

Good quarter-plate lens, Eurycope preferred; approval.—Nicholls, Pawnbroker, Darlington.

Lens, etc.—R.R. and P.S. 7 by 5, Optimus preferred; also bellows-bodied half-plate studio camera, with or without lens and inside shutter; also graphoscope and stereoscope, cash, or exchange violoncello, violin, paintings, etc.—3, Walpole Street, Wolverhampton.

Sets.—Quarter-plate Instantograph set; exchange 9 in. burnisher, as new, cost 35s.—Evans, Minehead, Somerset.

Half or quarter-plate camera, lens, etc., part cash and exchange.—Phot., 70, Adelaide Road, Brockley, Kent.

Shutter.—Thornton-Pickard instantaneous and time shutter, 2½ in. hood.—A., Cleveland Mills, Stockton-on-Tees.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,600 words; and those which are awarded Prizes will be published in the AMATEUR PHOTOGRAPHER; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his personal experiences. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th February	Apparatus.
28th March	Optics.
28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: Their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August	Artistic Effect and Composition.
29th September	Outdoor Instantaneous and General Photography.

All MSS. to be addressed to the Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM	Six Months, 5s. 6d.	Twelve Months, 10s. 10d.
POSTAL UNION	6s. 6d.	13s. 0d.
INDIA, CHINA, ETC.	7s. 9d.	15s. 3d.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

The Proprietors of the AMATEUR PHOTOGRAPHER will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	Feb. 14	June 14.
LANDSCAPE WITH FIGURE	Mar. 14	July 14.
GENRE OR FIGURE STUDY	April 14	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	May 14	Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs will be reproduced in the AMATEUR PHOTOGRAPHER.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the AMATEUR PHOTOGRAPHER.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

Prints for next competition, "Landscape or Seascape," must be sent in on or before the 14th day of February, endorsed: "Monthly Competition," the Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

In another column we give the award of Mr. A. Stroh, who has so kindly and carefully examined the slides sent in to the AMATEUR PHOTOGRAPHER Third Stereoscopic Slide Competition. We will shortly set aside one or two days when they shall be on exhibit at our offices, and, if possible, will arrange that they shall be shown during the evening of one of those days from 7 till 10 o'clock. The quality of the slides generally is, perhaps, in advance of the previous competitions, but we could wish that more competitors had entered. We shall, however, persevere, and trust that both work and numbers may be better next year.

* * * *

THE enlargements entered in our Monthly Competition are many of them very fine; they are now on exhibit every day, except Saturday, from 11 till 5 o'clock, and on Saturday from 11 till 2 o'clock. Visitors are requested to leave their cards or to sign the visitors' book. The pictures will be on show until the 31st inst., after which date they are available for exhibition before photographic societies upon our general conditions. Early application should be made, as already many dates have been secured. The exhibition of these pictures will make an excellent entertainment for a club evening. A list of pictures, and the names of the competitors is given in another column. The prizes cannot be awarded this week, but will be announced in our next, we hope.

* * * *

THE very great interest that is and has been taken in that gigantic engineering enterprise, the erection of the Forth Bridge, has prompted us to offer special prizes for sets of four views. These views are to be sent in on or before the 10th of March, that date being fixed in order to permit of photographs of the opening ceremony by H.R.H. the Prince of Wales on the 4th of March to be included in the set.

* * * *

WE have much pleasure in stating that the April number of the PHOTOGRAPHIC QUARTERLY will contain a portrait of Mr. George Davison, the Hon. Secretary of the Camera Club. We have thought it probable that many of

our readers will be glad to have a counterfeit presentment of a gentleman so prominent in photographic circles.

* * * *

THE Woodburytype Company, who have executed our commissions for the frontispieces that have appeared in the two numbers of the PHOTOGRAPHIC QUARTERLY, have sent us most excellently executed transparencies of both "Salisbury Cathedral" and "Harmony." The work is admirably done, and when mounted in a hanging frame is exceedingly effective. The colour in both cases has been well preserved, and reflects much credit upon the artistic capabilities of the Company.

* * * *

FROM time to time we have had to chronicle the birth of photographic journals and kindred publications. Not the least promising was the *Photographic Review*, started as a penny weekly by Mr. Thomas Bolas, immediately after his resigning the position of Editor of the *Photographic News*. He was for very many years connected with that paper, but held, we understand, views at considerable variance with the proprietary, with the result that he at last thought it best to resign. In order to maintain and make known his own views, he started the *Photographic Review*. The *Review* has had a brief career, only twenty-nine numbers being published. Mr. Bolas announces its decease in a rambling, disconnected leader in the issue of last Saturday, the 18th inst., yet he seems somewhat alive to the humour of the situation, for in the meagre index which is inserted in the copy before us, we find this line—"Photographic Review, The end of." We regret that one of the reasons for giving up the *Review* has been the "trying to do too much work of very divers sorts." We hope Mr. Bolas may be spared to contribute to the existing journals much from his store of photographic knowledge which everyone admits he possesses, and that he may speedily recover from his over-work. He can certainly content himself that, even though *la Revue est morte*, there are sufficient publications devoted to photography to provide for all the present requirements of the professional and amateur photographer.

For Contents, Prize Competitions, Notices, etc., see page 64.

RULES, conditions, and entry forms for the AMATEUR PHOTOGRAPHER Monthly Competitions will be ready next week. The book of rules, etc., will contain four entry forms covering the competitions in February, March, April, and May, after which date further forms may be obtained. We shall be pleased to send copies to secretaries of photographic societies for distribution amongst their members. We hope that during the summer months amateurs attending excursions will make a point of securing a picture for each of the AMATEUR PHOTOGRAPHER competitions. At the close of the season—end of September—the prints will be at the disposal of the photographic societies, and the comparison of work done by members of societies and others all over the kingdom can but have a beneficial effect, and prove a means of drawing all the workers of photography closer together, and of disseminating amongst them a vast knowledge of the resources of this country and the beauties of Nature in her varying moods.

* * * *

We know that many of our competitors are careful as to the statements they make in regard to the work they send in to our competitions, and we have never in our experience discovered a competitor making a statement on his entry form that was untrue, nor have we ever had the work of others passed off upon us as being that of a competitor. But it has been left to Mr. William McLean, of Forbes, New South Wales, to send us a declaration before a commissioner for affidavits, that he is an amateur photographer. The declaration, made before a magistrate of the Supreme Court of N.S.W., reads—

"I, William McLean, of Forbes, New South Wales, draftsman, do solemnly and sincerely declare that I am a *bona-fide* amateur photographer, and that all the work from commencement to finish is my own, of the photographs submitted by me herewith, with a view of all or any of them taking part in the AMATEUR PHOTOGRAPHER Monthly Competition, and I make this solemn declaration, conscientiously believing the same to be true, and in virtue of the provisions of an Act made and in the ninth year of the reign of her present Majesty instituted," etc.

The trouble that Mr. McLean has taken will prove to our readers that the Monthly Competitions are appreciated all over the world. The photographs sent by Mr. McLean promise well, and some of them will be entered for the "Prize Tour Competition," and exhibited at the Crystal Palace Photographic Exhibition.

* * * *

THE frames for the Photographic Exhibition being promoted by the City of Belfast Y.M.C.A. Camera Club, must be sent to the Secretary, Mr. J. H. Hamilton, 14, Wellington Place, Belfast, on or before the 26th March.

* * * *

IN next week's issue we shall publish the view taken in Battersea Park by Mr. W. T. Goodhew, for which we awarded him the AMATEUR PHOTOGRAPHER Bronze Medal at the recent exhibition of members' work of the North Middlesex Photographic Club.

* * * *

THE members of the Manchester Amateur Photographic Society hold their fifth annual general meeting on the 28th inst. During the evening, as is their custom, there will be a sale by auction of photographic apparatus, the

property of members; only members can bid. A commission of 5 per cent. is charged to defray expenses. We make no doubt that considerable advantage and amusement is got out of this auction, and we commend it to the serious consideration of the members of other societies.

* * * *

THE members of the Edinburgh Photographic Society will hold their first popular evening on Wednesday the 29th inst.

* * * *

THE following is the order of the first six photographs to be reproduced in the PHOTOGRAPHIC QUARTERLY, as voted by coupon:—

First—"When the Day's Work is Done" (H. P. Robinson).

Second—"Carolling" (H. P. Robinson).

Third—"Water Rats" (F. M. Sutcliffe).

Fourth—"Wayside Gossip" (H. P. Robinson).

Fifth—"Sleepy Hollow" (J. Gale).

Sixth—"A Breezy Day in Spring" (G. Davison).

* * * *

THE following communication has just come to hand from the Hon. Secretary of the Camera Club:

"Will you kindly allow me to announce that the Exhibition of Rejlander's photographs at the Camera Club will close on Thursday, January 30th. Until that date the exhibition will be open to visitors on presentation of card, from 10 a.m. to 5 p.m.

"On and from Tuesday, February 4th, there will be an Exhibition of Photographs by members of the Amateur Photographic Field Club."

"This society is known as one of the earliest devoted to landscape work, and part of the exhibition will be given up to showing results of the older processes. The collection will be open to inspection for about six weeks under the usual conditions."

* * * *

A CORRESPONDENT, in somewhat an erratic letter, suggests a teaching club where the young aspirant to photography may, for a small fee, be put through his facings in photography. We shall be pleased to have the views of our readers upon such a scheme!

* * * *

THE Rev. J. G. Gibson will be glad to hear from intending contributors to the Royton Photographic Exhibition. It is very desirable that photographs intended for competition should be entered with as little delay as possible. There is really a most liberal prize list.

* * * *

MR. H. MACLEAN, F.G.S., writing from Gratwick Lodge, Birdhurst Road, S. Croydon, writes us:

"You will be glad to know that I have initiated a movement for the formation of a photographic society for Croydon and district. I shall be greatly obliged if you will make this fact known in your journal, and also intimate that I am desirous of receiving, without delay, the names of all who approve of the project."

We should imagine that Mr. Maclean will have no difficulty in forming an admirable photographic society. We know there are many ardent workers in the district, and they will, we feel sure, willingly support the movement.

* * * *

WE have before us a syllabus of the course of free lectures to be delivered in the Rotunda Hall, Liverpool. Mr. A. W. Beer, in sending us the particulars, says that out of thirty-eight lectures no less than thirty are

illustrated by means of the lantern. He is giving a lecture on the 4th prox., entitled, "On the Borderland of England and Wales," illustrated by 150 slides, the work of Mr. Cornish and himself, both, as is well known, active members of the Liverpool Amateur Photographic Association.

* * * *

Mr. J. JAQUISS makes yet another proposal for the use of the lantern, in his letter which is published in another column. Will our many readers help him?

* * * *

WE very much regret that we are compelled to hold over several reports of photographic societies' meetings; we regret this the more as we are of opinion the "copy" might have been sent us at an earlier date; the meetings of which reports are to hand were held on the 9th, 15th, and 17th inst. We must ask Secretaries to send reports at once after the meetings. It is impossible for us to insert reports, except in very exceptional circumstances, that come to hand after mid-day on Tuesday. The calls upon our space and the time required to *properly* print and turn out a paper with the circulation of the AMATEUR PHOTOGRAPHER, are such as to compel our making up the paper by Tuesday evening. This fact must be remembered by all contributors, in order to prevent disappointment.

* * * *

THE annual exhibition and *soirée* of the members of the North Surrey Photographic Society, which was held at the Norwood Institute on Monday last, was decidedly a success. There was some very good work shown, and the judges, Messrs. Gale, J. Thompson, and Starnes, must have found some difficulty in making their awards. Hence medals (one silver and two bronze) were offered for any class of work, and they went, the silver to T. J. Bright, for some effective enlargements from hand-camera negatives; the first bronze to Louis Wolff, for a charming little set of quarter-plate platinotype prints; and the second bronze to William Rice for another set of enlargements. Subsequently there was a lantern exhibition, of which, perhaps, the less said the better, both as respects the slides and the manipulation of the lantern. However, a prize had been offered for the best set, and it was awarded to Mr. L. Wolff, the judge being Mr. Brooks, of Reigate, who most decidedly selected the best set for the honour. The commonest fault of the slides was the bad selection of the portion of the larger picture for reproduction; a little more judgment on that point would have saved the character of many of them.

* * * *

NEW YEAR'S NOVELTIES.

WE have had occasion recently to take a journey of some distance, and there would have been no need to have mentioned the fact had we not been accompanied by the latest advent in photographic implements, namely, the new "B" Kodak of the Eastman Company, furnished with a spool of their rollable celluloid film, and as our results were developed with Marion's new crystallised sample of Eikonogen, we thought that some description of our experience with these three novelties of the season might be of interest to our readers.

Taking the camera itself first, we may mention that in form it generally resembles the original model, but with

the great advantage that it gives a picture of a circular shape $3\frac{1}{2}$ inches in diameter. This means, practically, a quarter-plate size, as in most hand-work it is quite out of the question to absolutely determine whether a picture composes best horizontally or vertically, and as far as our experience goes, for this reason a quarter-plate possesses no advantage over the lantern size, whereas a $3\frac{1}{2}$ inch circle permits, even when artistically trimmed, of giving a picture that is quite large enough to stand *per se*, and, needless to say, is exactly the size for lantern work. Like the original Kodak, the present one works at a fixed focus—that is to say, the lens is of sufficiently short focal length and sufficiently stopped down to virtually bring all objects into good focus; that is, it will equally well take a full-length portrait or a distant landscape. This absence of focussing arrangements undoubtedly simplifies the manipulation of the camera, but brings its attendant drawback in the short focal length of the lens, and the consequent wide angle included in the picture.

The shutter, so arranged that the lens is only uncovered during exposure, and not during the setting of the flap, is most ingenious, and when we add that the camera is furnished with a small finder, and is capable of taking 100 exposures, we shall see that the Kodak has now passed beyond the toy stage, and has become a very serious and useful instrument of considerable value to either the painter or the traveller.

The new rollable film, which has at last made its *début* on the English market, is formed of celluloid, a material that is now known to all of us in the form of cut pieces as a support for the sensitive film; but the present sample differs from these in its excessive thinness, being nearly as thin as the paper on which these lines are printed, and as a matter of fact, appreciably thinner than the old stripping film. The emulsion with which the film is covered is undoubtedly very rapid, quite as fast, indeed, as any of our lightning dry plates. The fact that we were able to do hand work at all during the past dull weather sufficiently proves this. Even in very bad light we got groups at Dover and Calais, not certainly fully exposed, but yet sufficiently so.

During development we found no difficulty from the curling of the film. When removed from the spool, it is naturally curled up, emulsion side inwards, but on contact with water it straightens out, and remains fairly flat during development. At first a tendency for the ends to curl up is sometimes apparent, but as the gelatine becomes saturated, the film flattens out. As far as we can judge, unlike the stripping film, which required a special developer, any of the ordinary developing agents suit the new one perfectly. As we have stated, we used chiefly Eikonogen, but comparative trials were also made with pyro and ammonia, and also soda and potash, and the film appeared equally amenable to all of them. Hydroquinone we did not try, but we have heard that it has a tendency to rot the gelatine film, but further experience is wanting in this direction. In fixing and washing, the treatment followed is the same as for prints or paper negatives; it is only in the drying that a little extra care is necessary. There are two ways of drying the films; the one is simply to suspend them by one corner and let them dry, when they will be found to curl up into a thin spill; they are then rolled the reverse way, after which they remain fairly flat. The second way, and

the one we prefer, is to keep them flat by some means or other till they are quite dry; the reason of their curling is of course the tension exerted by the contraction of the gelatine film when dry; if the gelatine be kept flat during this operation, a permanent tension is put upon it, and when dry it remains flat, and has no tendency to curl up. The method we found best was to pin the two upper corners to a shelf by drawing pins, and then nip the bottom between two pieces of wood sprung together with an india-rubber band; the weight of the wooden clip keeps the film *taut*, and when completely dry it remains perfectly flat and under control.

The Eikonogen we used in our development was the new crystallised variety lately introduced by Marion. Our formula was made up according to the deductions we gave in an article on this developer published a short time back (see *ante*, vol. x., p. 427), namely, 10 grs. of eikonogen, 20 sulphite, and 10 of carbonate of soda, to the ounce of water. This forms a clear, slightly yellow solution, that keeps perfectly if not used. When once used it turns of a rich claret colour, and after the second day, had lost much of its powers, but this, it must be remembered, was after it had developed some thirty negatives. We cannot say that the results were distinctly superior to the pyro-developed negatives, at least not in respect of getting out detail, but one very great advantage it gave was in the quantity of negatives that could be developed at once.

We had as many as ten films developing at once in a half-plate dish, and that with an entire absence of stains or marks, whereas when pyro and ammonia was used in the same way, stains and unequal development resulted. As we have stated before, Eikonogen is unequalled for this kind of work, and although we do not consider it superior to pyro for large and carefully exposed work, we think its use must become very general for hand-camera exposures, especially as these are usually developed in batches. We must generally congratulate the introducers of the above novelties on the excellence of their productions. It is but rarely that one succeeds so well at first, when working entirely with unknown quantities, and we think it only fair that every credit should be given them for their efforts in simplifying the process of our art-science generally.

* * * *

PHOTOGRAPHS AT KEIGHLEY.

LAST week we commented at some length upon the photographs exhibited by professional photographers at Keighley, and in this article will make a few remarks upon the work contributed by amateur photographers. We may at once say that many gentlemen whose pictures have been hung at different exhibitions were absent, but this fact is not singular to Keighley. A coterie of well-known amateur workers have, for reasons best known to themselves, abstained from exhibiting at provincial exhibitions. We do not know whether this is due to the working of the champion class rules, or whether the much-exhibiting coterie of the past have nothing new to show.

In Landscape or Seascape, Mr. Alex. Keighley takes first prize with "Water Carriers," a well composed picture, in which women in the foreground are dipping water, and the background is well balanced. "Hauling in the Boats" is a sea-shore study, and free of any forced composition. We understand that Mr. Keighley, who is something of an artist as well as a photographer,

first makes a sketch before ever he brings his lens in to work. Many other pictures by him are shown; some of them will shortly be published by Messrs. Hazell, Watson, and Viney, Ltd., and our readers will then have an opportunity of studying the careful and artistic work done by Mr. Keighley. Mr. Ernest Beck is another worker in whom we see great promise, and in "Whitby Harbour" we have a seascape which, in our opinion, surpasses many of Sutcliffe's pictures, and in "Eventide" we have a landscape that will rank side by side with many of the medalled pictures of older workers; for these two prints Mr. Beck was placed second in the class. Mr. John E. Austin secured third, with "Listening to the Bells." Good work was shown by many, and the average merit certainly was higher than last year. The Rev. H. B. Hare showed many old favourites, but when will the reverend photographer produce a new photograph? Mr. Alf Nicholson's pictures are hard and over-printed, but his selections of subjects are many of them good. We hope soon to see him doing more careful work, and should advise him to try printing from some of his negatives on matt-surface paper, especially his view of "Up the Harbour, Whitby." Mr. A. R. Dresser sent a mixed lot, "Rough Sea at Bognor," really an instantaneous shot; "Mending Nets," which we have seen before, "many a time, many a time," and which should have been entered as a "subject picture;" and "Ploughing," another old friend. Mr. A. W. Gottlieb exhibited some well-chosen pictures. "Waiting to be in it" shows some humour. The scene is near Bristol, and Mr. Gottlieb had set up his camera in order to secure a view of Clifton Suspension Bridge, in which we may add he succeeded admirably. But the title refers to several onlookers, who had seated themselves on the coping of a wall with the fixed intention of "being in it." Mr. Gottlieb got them capitally, and the subjects are as stiff and formal as the most accomplished itinerant photographer could desire. They will remain a very lasting monument to "natural pose." Mr. J. S. Blanckensee contributed a few bold and well-selected views.

In subject pictures, Mr. Keighley takes first with "A Thorn in the Foot," or, as it is more lately called, "The Wounded Foot." Mr. Austin takes second with "Fast Falls the Eventide," an old man returning from his work at the close of the day, weighed down heavily with the bundle of faggots. Not only is the picture typical of the closing day, but also of the old man's closing life, and so creates an interest as a "subject picture" which it would not otherwise possess. Mr. J. W. R. Brocklebank takes third prize with "Feeding Sheep." Mr. A. R. Dresser sends four frames, but we can make no selection as to which is the best of them—perhaps "Geese." We have known Mr. Dresser for many years, and are surprised that he should send for exhibition such a repulsive photograph as "One More Unfortunate," supposed to illustrate Tom Hood's well-known poem. It represents a woman who has sought a resting place from the troubles of the world in the surging sea, and the cruel waves have thrown up their dead on the beach; of course the thing is a sham. A most gruesome and disgusting use of the power of photography has, we venture to think, never before been exhibited, and we trust never to see any thing of the kind again.

Architectural photographs are not numerous. Those by Mr. W. H. Banks, who takes first prize, are exceedingly fine; they are mostly of buildings in France and Brittany

Mr. C. C. Cole thoroughly deserves second place, and the Rev. T. Mellovey, who takes third prize, shows some good local work. The ubiquitous Mr. Dresser turns up in this class again, and shows nothing worth a line.

In "Enlargements," Mr. T. J. Bright is placed first with some very clever pictures enlarged from hand-camera negatives. Mr. A. R. Dresser takes a well-deserved second prize for a "Rough Sea at Jersey;" as a study of wave-life we have hardly seen it surpassed. The third prize is for "Somerleyton Hall, Main Entrance," by Mr. H. D. Arnott; the work is carefully done, and a most effective view given of a very fine house. Mr. Keighley shows enlargements of his well-known photographs "Times is Bad" and "Children of the City. In our opinion the subjects are not at all suitable for enlargement, although the work is cleverly executed. In this class Mr. W. H. Kitchen shows a large number of pictures; his animal studies are good, and several others show careful work.

Portraiture is certainly not the *tour de force* of amateurs. Mrs. G. Young shows some nice work, and takes first prize. Mr. Dresser takes second in the four portraits of Breton peasants, which he labels "Breton Costumes." The ladies photographed are exceedingly good-looking, quite as worthy of mention as their costumes. The pictures have the further charm of being printed on Fry's ivory positive films, a vehicle which, in our opinion, is especially suitable for portraiture. Miss Clarisse Miles takes third prize with a well-executed study of "Two Sisters." This exhibitor's work would show to much greater advantage if the prints were mounted and framed in oak with gold slip and showing at least $2\frac{1}{2}$ inches of mount as a margin.

The lantern-slides award have been published. Mr. E. G. Lee was a good first. Mr. Dresser sent something less than a hundred, many of them very poor, the prize being awarded to his "Wave Studies at Jersey." No doubt many of the others would give pleasure on the lantern evenings, but it is the height of absurdity to enter such a miscellaneous lot in competition for a prize. Mr. E. Beck took third place with twelve well-chosen and carefully made slides.

In the Mechanical Class the work was good; in the Scientific Class there were only two competitors, who took the bronze medal and certificate, upon the award of Mr. C. H. Bothamley. In the Champion Class the entries were not numerous. The four other classes in which prizes were given were special, and the medals were awarded to prize winners whose photographs have been commented upon.

* * * *

STEREOSCOPIC SLIDE COMPETITION.

REPORT AND AWARD.

We have pleasure in publishing the following report (received from Mr. A. Stroh) upon the slides entered for the AMATEUR PHOTOGRAPHER Third Stereoscopic Slide Competition:—

"Having examined the slides for this competition, in which it appears that eighteen competitors have taken part, I find that the best work has been done in transparencies in Class 1, Section *a*. Nine sets of four and one set of six, making forty-two slides, have been entered in this section.

"The prints on paper in Class 1, Section *b*, where eight sets of four, or thirty-two slides, have been entered, are not equal in merit to the work in Section *a*.

"In Class 2 not much has been done, there being only one competitor with four slides in section *a*, one with four slides in section *b*, and one with one slide in *a*, and three in *b*, or twelve in all.

"The total number of slides is eighty-six.

"A very striking feature in this collection of slides is the variation of distance between the two pictures composing a slide, or, rather, the distance between the images of the same object in the two pictures. A wide discrepancy prevails among the slides of different contributors in this respect, the distance varying from $2\frac{1}{2}$ to $3\frac{1}{4}$ ins. in Class 1, and to $3\frac{1}{2}$ ins. in Class 2.

"In some sets, the four slides vary considerably among themselves, showing that the respective contributors hold no decided opinion in the matter. Those who adopt a distance of $2\frac{3}{4}$ ins. or under have probably found that unless they do so, not all their friends can appreciate their work, and those who adopt a distance of 3 ins. or more do not mind if a few of their friends cannot see their pictures in stereoscopic relief without squinting, or hurting their eyes.

"There is no doubt that a difference of opinion exists on this point, and therefore I will not dwell upon it too much in selecting slides for prizes. But since a line *must* be drawn somewhere, I will do so at 3 ins. for Class 1, and reject only such slides in which the distance is still greater. Happily, there are not many which are affected by this rule.

"In selecting the best slides for prizes, I have taken into careful consideration (1) their photographic value, (2) tone or colour, (3) choice of subject, (4) stereoscopic qualities, (5) mounting and finishing; and I find that all slides fall short more or less in one or other of these five qualities.

"The two sets which gained the highest number of marks in my examination are sets No. 4 and No. 8.

"In the last-named set there is, however, one slide which turns the scales. It is 8c, "The Lower Falls, Rydal." The photographic value, as regards definition, careful manipulation, choice of subject, and especially colour of image, is so satisfactory that I will recommend the set to which it belongs for the first prize.

"The following, then, is the order in which I recommend the prizes to be distributed:—

CLASS 1.

(Slides made for viewing in the ordinary Stereoscope, the two pictures composing the slide to be about 3 ins. square.)

First Prize, Sec. <i>a</i>	..	Henry G. Ridgeway (Sunderland).
Second " " <i>a</i>	..	M. W. Thompson (Manchester).
Third " " <i>a</i>	..	Frank Howard (Wallingford).
Fourth " " <i>b</i>	..	Cecil V. Shadbolt (Chiselhurst).
Fifth " " <i>a</i>	..	W. H. Charlesworth (Huddersfield).
Sixth " " <i>a</i>	..	Thos. Ferguson (Kilmarnock).

CLASS 2.

(Slides which cannot be viewed in the ordinary Stereoscope, and where the pictures are larger and of different dimensions than Class 1.)

First Prize	..	Withheld.
Second " Sec. <i>a</i>	..	H. Forsyth (Bradford).
Third " "	..	Withheld.
Fourth " Secs. <i>a</i> and <i>b</i>	..	Capt. Thos. Lamb.
Fifth " "	..	Withheld.
Sixth " "	..	Withheld.

a. Transparencies on glass or other support.
b. Paper prints mounted on cardboard.

"Feeling that under difficult circumstances I have done my best to make a fair selection, I trust that it may meet with your approval and that of the contributors who took part in this competition."

Letters to the Editors.

TRANSFORMATION OF FORMULÆ.

SIRS,—Now that so much is heard of the superiority of the metric system over the English, I think some agreement should be come to as to the way in which translations shall be made from the one into the other. The plan adopted by some writers of transforming separately each member of the formula is, in my opinion, the worst possible, generally leading to results quite impossible of application. What we require is, not a literal translation of our formula item by item, but a *corresponding* formula, such as any one would be likely to construct who wished to obtain the same proportions of the several ingredients as are used in the original formula. I think the simplest method is to take as the basis of the English formula the number of grains in one ounce, and for the metric formula the number of grammes in 1,000 c.c.

Then, to pass from one system to the other, say from English to metric, we multiply the number of grains by $2\frac{1}{2}$. This gives the number of grammes in 1,000 c.c. To multiply by $2\frac{1}{2}$ we simply multiply by 2 and add on $\frac{1}{2}$ part of the result. Conversely, to pass from the metric to the English system, we have to *divide* the number of grammes in 1,000 c.c. by $2\frac{1}{2}$. This we do by dividing by 2, and then deducting $\frac{1}{2}$ part of the result. The result will be the number of grains in one ounce.

For example, 4 grains in one ounce are equivalent to $9\frac{1}{2}$ grammes in 1,000 c.c.; or, again, 40 grammes in 1,000 c.c. are equivalent to $17\frac{1}{2}$ grains in one ounce. Of course, when the formula for 1,000 c.c. is found, the shifting of the decimal point will give it for 100 c.c. But it was rather more simple to find it for 1,000 c.c.—Yours, etc.,

CLIFFORD E. F. NASH.

* * * *

LANTERN NIGHTS.

SIRS,—No doubt many of your readers are situated like myself, viz., masters of schools in very poor districts. Many of my scholars come from wretched homes, and during the winter months I have often given them "lantern nights" so as to brighten up their little lives.

At these times I have often been struck with the interest they have taken in scenes touched upon in their "geography lessons," and the desirability of getting a series of slides to illustrate the *whole* has more than once been in my mind. But the expense is too great for most of us, and yet, as a body, we might assist each other materially.

The scheme most feasible to my mind is the mutual exchange of slides (I think this better than lending negatives), or it may be gifts of slides one to the other. I should be glad to do this, or any other plan suggested, so as to secure (or assist others to do the same) a number of typical slides.—I am, Sirs, yours truly,

JOS. JAQUISS.

* * * *

CHEAP PLATES.

SIRS,—In the AMATEUR PHOTOGRAPHER of 10th instant, "An Arithmetician" writes that it could not pay to make half-plates at the rate of 13s. per gross. Now I don't see why plates should not be sold at this price, or even less, from the statement made by Mr. Marsh at a meeting at Dulwich of the North Surrey Photographic Society, "that a good emulsion can be made at an approximate cost of one penny per ounce, which quantity will coat six quarter-plates, or one 10 by 8." By this it is clear, therefore, that a dozen quarter-plates can be made for *twopence*, and for half-plates say *fourpence* per dozen, or 4s. per gross, which leaves 9s. for profit and expenses on each *gross of plates*. Surely this will pay the manufacturer.—Yours truly,

AULD REEKIE.

SIRS,—In response to some queries on this subject in a recent issue, allow me to disclaim any *interest* whatever in the sale of any dry plates. Opinions on this subject seem very diverse, as "Arithmetician" considers dry-plate makers are having a poor time, whilst "E. B. K." thinks they are making rapid fortunes.

My own idea is that there is a *middle* point between 13s. per gross for half-plates and 26s., at which a really good dry plate can be sold at a reasonable profit to the maker, and a guarantee that the unfortunate amateur is not wasting his talents on a worthless plate.

I know nothing whatever of the manufacture of dry plates, and cannot even guess as to what return the manufacturers make on their capital, but it is reasonable to suppose that if one man can afford to sell any quantity at a price less than half the general maker's price, the majority of the manufacturers must make an extortionate profit.

You are at liberty to give the name of the plate-maker to whom I referred to anyone who may apply to you.—Yours truly,

A COUNTRY COUSIN.

* * * *

HYDROQUINONE.

SIRS,—I have been using hydroquinone developer for the last two months, and I have found it to be one of the finest developers I have as yet used. I see Mr. Rowland's letter in last week's AMATEUR PHOTOGRAPHER, and he complains of his negatives being of a deep yellow tinge, and that the developer stains his fingers. It never has behaved so in my experience of it. Mr. Rowland does not make his developer exactly as it should be made. I have this developer in my notes exactly as Mr. Sandle recommends for the Pall Mall plates.

The proper formula for this developer is:—

	1.				
Hydroquinone ..	..	..	..	..	160 grs.
Sodium sulphite ..	..	..	..	..	2 ozs.
Citric acid ..	..	..	..	..	60 grs.
Potassium bromide ..	..	..	..	..	80 "
Water, to ..	..	..	..	..	20 ozs.

	2.				
Sodium hydrate ..	..	..	..	..	160 grs.
Water, to ..	..	..	..	..	20 ozs.

To develop, take equal parts of each solution. It is recommended to use the alum bath after fixing. Markings are frequently caused by its use before.

If Mr. Rowland is enlightened by my theory, I shall be glad to hear of his success.—Yours truly,

LESLIE BAKER.

* * * *

COPYING.

SIRS,—I thought that some of the readers of the AMATEUR PHOTOGRAPHER might find the following useful.

The first point the amateur ought to do in copying pictures and photographs is to select his or her place. Good results are hardly ever obtained in the open air; the amateur ought to do it in a room which is not too bright. In this sort of weather which we are having now, 2 p.m. is a good time, while in summer I always copy about 5 p.m. After the amateur has chosen his room, he should turn his picture upside down so as to be able to make the focussing easier. But now we come to a harder subject; what about the exposure? Well, I always stop down as much as I can, and then give it a quarter as much as I would ordinarily. In developing a photograph copied, put a small amount of bromide in the developer (whatever it may be—I mean whatever developer it may be)—to make the items of the picture more distinct and more separate, if I may use the phrase. The last point, but not less important, is not to hurry over the printing. Do it in as weak a light as possible, and on no account put it under the sun. Apologising for the length of my letter, I am, etc.,

JOHN H. MONTAGU.

* * * *

GLAZED-SURFACE PRINTS.

SIRS,—In response to the inquiry of Mr. W. E. Bex, I have pleasure in adding a few further remarks as to obtaining the high gloss upon various classes of prints. To reply, in the first place, as to the special enamelled plates, they are to be had in two sizes, namely, 9 by 7 and 13 by 11 inches, or larger sizes to order; the price being 1s. and 2s. 3d. respectively, and they are sent post free by Mr. Gotz, 19, Buckingham Street, Strand, or from Mr. J. Fallowfield, Lower Marsh, Lambeth, for 4d. extra for postage.

As prints take some little time to dry, and as several prints can be put on the plates at one time, it is as well to have a larger plate than the prints, to save time.

To give the precise details of procedure, I may say: Take the thoroughly wet prints from the water, and pour a little water on

the polished surface of the special plate; place the print thereon, and press gently to the surface, then run surplus water off, and damp the moisture from back of print with a clean handkerchief; place a bit of clean note-paper over print, and roll it down with a roller squeegee, or the usual sort. Place the plate with prints upon it in a dry room, and let all dry naturally and without heat; this is important, as heat will spoil both plate and print. Prints are not to be touched, but are to be allowed to fall off of themselves, which they will do in about half-an-hour in the case of albumen prints, and somewhat longer for bromide, and for gelatino-chloride and Alpha prints, as they are thicker and dry more slowly. The prints should be put in a book directly they fall off the plate, and pressure put on them, which will cause them to remain quite flat.

To Mount the Glazed Prints.—Proceed as above described till the print has been put on the plate, then take a piece of the special paper (sample of which I enclose), and having cut it to a size so that it is one-sixteenth of an inch smaller all round than the print, paste the white side of the paper thoroughly, and place it carefully on the back of the print (while it is still quite damp) on the plate. You will then have the print backed with the paper on the plate, which is set aside to dry naturally and without heat. After the print and its backing paper fall off the plate, it will be seen to be perfectly attached to the paper, and the print itself will have a magnificent enamelled appearance. Now paste the backing paper; or if the print requires trimming, do it at once, and then paste the black surface of the paper, and mount in usual way. Do not put on too much paste, or it will exude at the edges, and get on the print. Place it under a weight to dry, and it will remain flat after an hour's pressure.

The special paper alluded to is white one side and black the other, and as it is practically waterproof for this purpose, the prints are easily mounted, and retain their splendid gloss.

The paper is cheap, and can be had at most stationers' or of the vendors of the metal plate. It is known as "black glazed paper, white one side."

Two little matters of importance are to be noticed. First, the paper backing must be one-sixteenth of an inch all round smaller than the print on which it is pasted, as no paste must be allowed to get over the edge of the print while on the plate, as in such case the former would be pasted to the plate, and so prevent the print falling off naturally. Second, do not pull the print off at all, not even when it is almost off, as by so doing the print will show a mark. Let it fall off of itself. I send you some prints mounted in the way described, which some of your callers might like to see—one gelatino-chloride print, one silver print, on ordinary mounts, also an Eastman's bromide paper print, with the paper backing attached, and just as it has fallen off the metal plate, with its attractive surface like polished ivory. This bromide print is, as you will notice, ready for mounting, when pasted in the usual way.

Of course, there is the method of mounting described in the AMATEUR PHOTOGRAPHER, by just pasting the extreme edges one-eighth of an inch only of the print, and so mounting it, but this has disadvantages.

I must add that the credit of the idea of the black paper method belongs to my friend, Professor W. K. Burton; at least, I believe so.

I have explained these matters in detail, as it may save many future "queries" in your columns.—I am, yours faithfully,

C. HETHTON LEWIS.

[The prints sent by Mr. Lewis fully bear out his statements.—Eds. A. P.]

SIRS,—I have been reading with much interest the letters on the above. I have experimented with the glass, and I find I can get a very nice glaze. I use no talc, and use up my old negative glasses, remove the film, just damp the photo, and squeegee on to glass, and then apply gentle heat to plain glass side, or place in the sun, when print will peel off itself. When dry, in mounting only damp the back of the photo with wet blotting, and then mount, and no gloss is lost at all. The price of the plates asked for by W. E. Bex is, half-plate 1s., whole-plate 1s. 6d.—Yours faithfully,

F. J. THORNTON.

* * * *

PHOTOGRAPHY AT BOULOGNE.

SIRS,—In reply to Col. Verney's letter in a recent issue, I write to give my experience when at Boulogne-sur-Mer for a few

days last summer. I met with no difficulty whatever in obtaining permission to photograph the interior of the cathedral. The Suisse, M. Lafoiret, on my making enquiries, sent me on to M. Libtoin, the Director, and on my calling upon him at his house close by, he received me with the greatest courtesy and gave me the necessary authority at once. Lafoiret was also most obliging when I called upon him with my camera next morning.—Yours truly,

EDWARD JACKSON.

The Complete Photographer;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER II.

The River Side.

PHOTOGRAPHER: Here is a bench under the shade of this old hawthorn which is just coming into leaf; in a month it will be white with may, and perfumed like the "sweet south, breathing o'er a bank of violets." Here we can discourse by the hour, while we watch this bend of the river.

ANGLER: Yonder is just the place for a trout. There in the eddy at the edge of the tail of the stream. Here the trout lie ready for the half-drowned flies that come down the rapids—which reminds me, we also have our wet and dry processes: the old-fashioned style of fly fishing, wherein care is taken to keep the fly afloat, and which I still prefer for rapid streams such as those of Wales, where I usually fish; and the newer art of dry-fly fishing, more suitable to the quieter Hampshire rivers. In this method the fly is made to float and behave more like the natural insect, than the old form of artificial fly. It is the belief of many observant fishermen that the trout and grayling have become so educated by being constantly angled for, that more refined lures have become necessary. I think this is almost as wonderful as any of the amazing stories told by Walton.

PHOTOGRAPHER: Tales are astonishing according to the age in which they are related, and there is little left to astonish us within this our time. There are no undiscovered "antres vast and deserts idle" for travellers to bring tales from now. But we are getting far away from our river-side and photography. Fishing and photography go very well together. The rod and the tripod pack in one parcel, metaphorically and literally. There is no "divided duty" that troubled Desdemona; we have not to sing, "How happy could I be with either, were t'other dear charmer away." Every landscape photographer—which means all amateurs—should be brothers of the angle. When the weather is unsuitable for one it is right for the other, unless you are a pessimistic naturalistic, and take your photography as well as your fishing sadly.

ANGLER: Fishing is like photography too in being an art. Old Izaak says, "Doubt not, sir, that angling is an art, and an art worthy of your learning;" and I think you will agree to this. He goes on to say, "The question is rather, whether you be capable of learning it? for angling is something like poetry, men are born so: I mean, with inclinations to it, though both may be heightened by discourse and practice; but he that hopes to be a good angler must not only bring an inquiring, searching, observing wit, but he must bring a large measure of hope and patience, and a love and propensity to the art itself; but having once got and practised it, then doubt not that angling will prove to be so pleasant that it will prove to be, like virtue, a reward in itself."

PHOTOGRAPHER: It is quite wonderful how each word

applies to the art of photography. I cannot add to or take from it. But we go a little further in our aspirations than Walton. We claim that photography is not only an art, but a fine art, ranking in its way, and as far as it goes—we all have our limits—with painting. Our painting friend, if he were here, would possibly deny this, though I am not sure, for many painters now recognise the brotherhood of photography, or rather they recognise that it is a means of art in the hands of artists. The difficulty is that there is so much photography done and so little that is good, but I think that if we could see the eleven or twelve thousand paintings sent to the Royal Academy any year, all but a couple of thousand or so of which have to be rejected, the most prejudiced painter would agree that not even all painting was art, or that the mere process gave a claim to the proud title of artist. "But, my worthy friend"—to quote, or rather paraphrase, Old Izaak again—"I would rather prove myself an artist, by being learned and humble, valiant and inoffensive, virtuous and communicable, than by any fond ostentation" of art. It is no use saying you are an artist if you do not show it. There is a proverb, "He that would have what he hath not, should do what he doth not," and if we desire to be called artists, we must do the work that will prove us artists. "The effect speaks, the tongue need not;" "Great strokes make not sweet music." But I will not weary you with proverbs.

ANGLER: I recognise those you have thrown at me as from the collection of holy George Herbert, whose life Walton wrote, and whose poems he quotes in the "Angler." There is a trout rising under the opposite bank, where the stream runs into almost still water.

PHOTOGRAPHER: Try him.

ANGLER: He came, but came short. It is too bright and fine—

"A day in April never came more sweet,"

as Shakespeare says, but it is not good for fly-fishing.

PHOTOGRAPHER: Then we will resume our discourse.

ANGLER: What has been the effect of the introduction of gelatine plates in photography?

PHOTOGRAPHER: It has contributed beyond measure to the progress of both the art and science of photography—so far good—but it has been its ruin as a profession.

ANGLER: The amateur?

PHOTOGRAPHER: Yes; but not directly, as you would suppose. It has not been the direct competition between professional and amateur work. It has been brought about this way. At the beginning of photography, fifty years ago, we were all amateurs. Then the noble army of professionals began to grow side by side with the amateurs, and photography grew, as it has grown, like the coral islands of the Pacific, by the indefatigable industry of a multitude of workers. The professionals increased, while in course of time amateurs became almost extinct until 1878-1879, when quick dry-plates began to come into general use. The processes of the art then became, up to a certain extent, so easy, clean, and delightful, that many thousands of people have gone into it as amateurs who would not have touched it in the wet days. Then came the mischief. A goodly proportion of these have succeeded so well in arriving at a certain amount of success, they (in the difficulty of finding something profitable and respectable to do for a living in the present over-crowded generation) have taken to the easy and apparently gentlemanly profession of photography. But so many have been struck with the same idea that there is scarcely room to move, and competition has so brought down prices that it has become a trade depending on a slight profit on the materials used, and the time of the assistants, and it follows that he who *does not* do his own photographs, but goes about touting for sitters,

is the most successful tradesman. It is a great disappointment to those who tried to raise photography to the rank of the liberal professions, and would have succeeded if the art had remained surrounded with beneficent difficulties.

ANGLER: But is it so easy to take a good portrait?

PHOTOGRAPHER: Quite, of a sort. Almost anybody could soon learn to take a portrait sufficiently well, photographically, to satisfy the mass of mankind, especially if he employed a good retoucher. Those who recognise the merits of something beyond the average good do not exist in great numbers. If average persons see a delightful expression, or that look which makes you exclaim, "How like him!" in a portrait, they don't give any merit to the management of the photographer, but attribute it to a happy chance, and think that any photographer would have got as good a result under favourable circumstances. All credit is given to the sitter or to the model. So that it has become the general opinion that all photographers are equally good, and the custom to value a photograph by its size, not by its merits.

ANGLER: What, all! The Millais and Moores of photography and the sign-painter, all treated as a case of the value of the paint and the man's time laying it on?

PHOTOGRAPHER: I cannot point out any single photographer who gets much more for his work because it is better than that of others. There is certainly the case of a few fashionable portrait photographers, and even their prices are not higher now than any decent photographer got say ten years ago. When you can get a cabinet and two cartes for half-a-crown, and this at an apparently respectable establishment, if we may judge from the plate-glass windows, it is time for old photographers to sing the song of Simeon, or the beginning of that canticle, anyway.

ANGLER: Would you advise me to join a society?

PHOTOGRAPHER: Yes, two or three. You will join your local society, of course, and by and by the Photographic Society of Great Britain, and afterwards the Camera Club. All photographers should join the Parent Society, as it is called. It may not be so lively or social as the smaller communities, but that is not its object. It is the central society of England, and should be well supported. Besides, it holds the principal exhibition of the world, and when it becomes ideally perfect, which it must be confessed it is not at present, all important discoveries, and the best results of discoveries, should first see the light through its auspices. The Camera Club is confined to amateurs, and there take place the most pleasant gatherings of photographers. It seems invented for the purpose of showing what good fellows photographers are. The provincial clubs also have the same characteristics. They sometimes, perhaps, overstep the boundaries of modesty in the way of providing medals for themselves, but it is an amiable weakness, and, after all, it is better to encourage young beginners, but when it comes to giving more medals than there are exhibitors, it is, to say the least of it, making them cheap.

ANGLER: I gather, then, that you agree in the main to the awarding of medals.

PHOTOGRAPHER: Most certainly. I consider they are a great incentive to progress. I can well remember my first medal, and how it fired me up to do better work. They were scarce in those times, and you could not get more than two or three a year if you got all possible. They are more plentiful now. But they are sometimes too costly. For instance, nearly every photographer who sent to last year's great Paris Exhibition was pretty sure of a medal, but a small space cost five pounds, and although they were a pleasant fruit of their labours to the eye, they turned to dust and ashes to the lips, for at the end of the Exhibition it was announced that winners may have their medals by

paying for them. Now the price of a gold medal was £15! This is too much to pay even for so great an honour as a medal which is distributed as freely as those of a provincial society. Now let us seek fresh woods and pastures new. A walk with a fly-rod down a stream takes you to places and discloses beauties you may otherwise miss. Peradventure we may expose a few plates on which you may take your first lesson in developing when we meet again in my dark-room.

ANGLER: There is a picturesque-looking beggar! What a chance of embellishing your picture with a suitable figure!

PHOTOGRAPHER: He reminds me of a curious incident that happened to a young lady photographer last autumn. She was photographing in a lovely lane in the country, when a sturdy and ferocious-looking beggar demanded alms. "If you will stand against that tree I will give you sixpence," said the young lady. "None o' that, young 'ooman," said the man, "you want to take my blooming pictur', and send it to the bobbies. It isn't good enough—I'm off!"

(To be continued.)

Winter Work.—XVI.

By T. C. HEPWORTH, F.C.S.

ON FRAME-MAKING.

(Continued from page 39.)

THERE is nothing new about the methods of cutting a mitre which I have detailed. Indeed, I should suppose that the mitre block and shooting board can themselves boast a very high antiquity. And a proof of their efficiency is found in their present popularity with the trade. Peep into the workshop of any professional frame maker, and you will see these venerable but effective appliances still at work, in preference to a number of more modern contrivances for performing the same offices. It is not by any means my purpose to decry the various appliances for cutting mitred joints which are now sold, for some of these are extremely serviceable. It would, indeed, be wise for the frame maker who can afford it to buy one of these machines as a labour-saver; but, from my experience of them, I am bound to admit that the cut which they make, although apparently clean and regular, is all the better for a finishing touch with the plane on the shooting board. Whether this want of exactitude is due to spring in the metal composing the cutting blade of the machine, or to the elasticity of the wood when cut under slow pressure, it is difficult to determine. But I should think that both causes contribute to the result. It may be the outcome of clumsiness on my part, but I certainly find that a frame made in the old-fashioned way has better corner joints than those cut by machine.

If the amateur should have many frames to make, it is perhaps the best plan to cut and shoot the four pieces comprising each, and after placing them in position on a flat surface to see whether the corners meet one another well, to tie up those relating to each particular frame, leaving the joining up to take place when all are ready for that stage of the work. By following this procedure the hand becomes accustomed to each operation involved, and a gradual improvement in the way in which it is executed will soon become manifest.

To make a good join, the best glue must be employed, and it must be used freshly mixed, for, as all users of gelatinous bodies should know, every time the glue is melted loses a certain amount of its tenacity. It must also

be hot as well as fresh, and must be applied to the work neatly and quickly. To glue up a mitred corner, place the longer piece of moulding in the bench-vice in a vertical position, and hold its fellow to it in the position it is to occupy permanently, but slightly overlapping the part which is held in the bench vice. The necessity of this precaution will be seen when the brads to hold the two pieces together are driven home, when it will become evident that there is a natural tendency upon the upper piece to slide downwards on the inclined plane formed by the cut edge of the lower piece. Holding the upper portion in the manner described, a hole should be bored downwards with a small bradawl, and in this hole a brad is inserted with the fingers. The pieces are now separated, the glue applied sparingly to each surface, the pieces joined once more, and the nail driven home with the hammer.

Various forms of mitre-cramps are sold which are used to hold the freshly-joined corner firmly until dry, but here again we can adopt an older-fashioned method with advantage. Cut out of close-grained wood, such as beech, a series of L-shaped pieces, of a thickness corresponding with that of the frame to be made. When all four corners of the frame have been joined up as described, place it flat on a table, and furnish each corner with one of these L pieces. Now stretch a strong cord right round the frame so that each L-piece is held firmly in position, after which, by twisting a stick round the cord, great tension can be put upon it, and the whole frame is bound tightly together until the cord is released after the glue has had time to dry.

Even though a frame has been well made, our work is not finished, for some little art and care are necessary in placing the picture within it. Unless this be done well and in such a manner that the air is wholly excluded, both back and front, our labour will be lost. It is a common thing to see a framed picture with its mount begrimed with smoke or dust, and generally discoloured. The reason of this is the omission of one very necessary precaution which should always be observed in framing water-colour drawings, photographs, or any description of picture which must be protected by glass. This consists in sealing the glass into the frame so that no contamination can reach the face of the picture. The way to do this effectively is as follows:—First see that both frame and glass are perfectly clean, and that the latter fits the rebate without leaving a vacant space between the glass and the inner side of the moulding. Glaziers are the most careless of workmen, and it seems a matter of indifference to them whether a glass fits well or badly in a frame which is entrusted to their tender mercies, a difficulty which the amateur will avoid if he only will take the trouble to learn to use a diamond himself. Having a well-fitting glass placed within the frame as it lies face downwards on a blanket-covered table, proceed to attach some previously cut slips of good stout paper by means of glue, to the edge of the glass. This should be done in such a way that the glass is actually glued into the frame all round, and cannot fall out when the frame is inserted. Next place the mounted picture upon the glass, and finally fill in the back with the usual board. A good frame maker will use for this purpose a properly planed and joined board, so that it has no seams through which the ever-present dust can get inside. But the modern cheap and nasty frame maker thinks it quite sufficient to insert a few rickety and very knotty boards, which would be quite useless for any other purpose under the sun. The quality of the board does not really matter very much, if it be, after nailing into the frame, completely covered with good brown paper by means of glue. Dust and smoke must be kept out by some such means, and their exclusion is particularly necessary in the case of photographs.

All narrow frames, whether they be of oak, ebonized wood, or any other material, are much improved by the insertion of a gold slip next to the picture. This can, like the mouldings, be bought by the length, and can be obtained of the same dealers. It is a false economy to use anything but a slip which has been covered with real gold leaf. The imitation ones look well for a time, but any scratch unseen at first soon develops into a black line, and this is the case even if it be placed under the glass. This course I recommend in all cases, even with the real gold slip, for it is by this means protected from all external influences, and will always remain clean and bright.

It will be seen later on that gilded frames receive a final coating of clear size made from parchment cuttings. This seems to somewhat dull their appearance when first applied, but the coating is a useful protector from dirt and dust. A frame of this description which has begun to look as if it required re-gilding can often be renovated by the homemaker. All that is necessary is to carefully sponge the frame with hot water, and to once more give it a coating of protective size.

(To be continued.)

Our Contemporaries at Home and Abroad.

THE *British Journal of Photography*, in an article on "The Acid Fixing Bath," says, "But, as matters stand, it appears to us that the worst that can happen is the deposition of a minute trace of sulphur on the surface of the film, whence it is easily removable by friction." And in one on "The Secrets of Photo-Mechanical Processes," it says, "We have even known half-a-dozen different processes to be tried in about as many days, and then condemned as being worthless, and that, too, by persons who have had no previous knowledge whatever of them, or of any other process to which they are analogous. . . . But we must protest against the often wholesale condemnation of writers, on the strength of a few experiments, by those who are absolutely ignorant of the very principles upon which the processes are based." Articles: "The Development of Gelatine Lantern Slides," "The New Benzoline Limelight," "Illumination of Negatives for Transparency Printing by Artificial Light," "The Standard of Excellence in our Art," "Letter from Germany," etc.

The *Camera*, speaking of Rejlander's pictures at the Camera Club, says, "His artistic proclivities and training enabled him to overcome all the mechanical difficulties of his task, and he gave a direction and impetus to artistic photography which will render his name respected and his work admired by all who know either the one or the other." Articles: "Detective Photography," "New Platinum Toning Process," "British Association of Photography," "Photographic Chemicals," etc.

The *Deutsche Photographen-Zeitung* (Wiemar) contains an article on the conference of delegates from German photographic societies' meetings at Wiemar, in July and August last.

The *Photographische Nachrichten* (Berlin) contains an interesting article on "Magnesium Flashlight and its Use."

The *Photographic News*, in its notes, regrets the fact that well-known pictures are not more frequently reproduced by photography, and says, "It has been urged that if photographs of a picture were sold at a low rate the sale of engravings would be injured, but we fail to see any force in the argument, as the classes of buyers are totally different." In an article on "Baskets for Photographic Apparatus" it says, "A basket-case should be so made that it can be used like a portmanteau in towns, and like a knapsack in the country, and should be furnished with locks and keys, so that it can be left in cloak-rooms at railway stations. Straps with fastenings and small padlocks are convenient for locking." Articles: "Sending Pictures by Telegraph," "Bromide Enlarging and Printing," "Photographing the Baby," "Package of Photographs for Postage," "Vapour Development," etc.

The *Photographic Record* (Manchester), in an article on "Exposure and Development," concludes with the following good

advice, "Don't buy so-called cheap apparatus if you wish to succeed in doing first-class work; don't use half-a-score different makes of plate, and think all will work alike; don't find fault with your tools before you are certain the workman is not to blame; don't imagine you can learn all about photography by simply reading an A B C guide on photographic matters. Practise yourself until proficient; don't go in for instantaneous work if you are only just beginning photography; don't think you can master the giant without tact and patience; don't use everybody's formula and expect to get good negatives; don't try to hurry development, the best results come from slow development, remember the tortoise was the winner of the race; don't under-expose, it is fatal to good work." Articles: "Bromide Printing," "Algiers and Constantine," etc.

The *Photographic Review*, in its concluding number, speaking of Tents, says: "We may say that, in our opinion, the tents now made and sold by our leading firms of dealers are quite superfluously fitted and far too high-priced to fill the actual wants of the out-door landscape photographer." In the valedictory article it says, "We wished to show that even from a commercialist point of view it is best to endeavour to be absolutely impartial, and to strain nothing in favour of advertisers or any other class. We have done something towards this; but in trying to do too much work of very divers sorts, have so far overstrained our strength as to make it absolutely needful to have some rest, and that immediately; indeed, it became a case of compulsion. The work of the *Review* was so personal and has been so completely in our own hands, that it did not seem practicable to arrange with others to carry it on, especially as there was some uncertainty as to the length of time which would be required as a rest. Consequently it seemed better to cease publication altogether than to risk the issue continuing with an altered tone or style." Articles "Preserved Sensitised Paper," "What is Art?" etc.

The *Photographic Times*, in an article on "Eikonogen," says, "Another property of eikonogen whose applications are obvious, is that by decreasing the dose in a given formula nothing is lost in the details. Not so with hydrochinon, even by increasing the dose of alkali to force out the details. Fogging is the only result. Pyrogallol, on the other hand, behaves like eikonogen in the case in question, the difference being in the intensity obtained, which is often insufficient with the latter." There is a fine reproduction of a study of trees, and articles: "Art and Photography," "Lens Images made Visible by Electric Current," "Submarine Photography," etc.

The *Photographische Rundschau* contains a reproduction of a view of Berchtesgaden, and of a stereoscopic slide representing two children playing at chess. It contains also the index for the last volume. There are articles on "The Amyl-acetate Lamp and Orthochromatic Plates," "The Practices of Amateur Photography," "Stereoscopic Work," "Films," etc.

Photography, speaking of exhibition matters, says, "We should now like to see greater power placed in the hands of the judges, and instead of their being expected to give two awards in each class, let the number be made according to the quality of the work, withholding altogether if none reach a certain standard, or giving three or even four if a class be found deserving of such a number." In another article, dealing with the progress during 1889, it says, "This process of Mr. Clark's—we call it his, though others have claimed priority—will probably remain with us one of the standard toning methods." Articles: "West London Exhibition," "Death of Father Perry, S.J.," "Photography the Handmaid of Science," etc.

The *Revue Suisse de Photographie* (Geneva), in an article on "Art in Photography," says, "One error into which beginners often fall, is that of desiring to take in a wide view of country in their picture. It seems to them that the fuller the landscape is of objects the more interesting it is. It is necessary, on the contrary, to know how to limit the subject, to look out the central point of interest which ought to be in evidence, and only to take into the picture that which is necessary." Articles: "Permanence of Prints," "Photography for Beginners," "Apparatus," "Phototypie," and "L.S. Jaccard-Bornand, Founder of the Lausanne Society." There are phototype reproductions of prints of the Chateau de Blouay; the entrance, and a view from the east.

The *Studio* (N. Y.) is a very interesting number, and contains

an engraving of an Etruscan Cist, part of the Castellani Collection, with an article upon it. Other articles on Durer's "Holy Family," "Rodin, the Sculptor," "A Lord Mayor's Show," "Of Cast Iron," etc.

Wilson's Photographic Magazine (N.Y.), in an article on "Narcotic Photography," says, "Dr. Emerson's articles criticised the photographs at the late exhibition with his usual out-of-focus eyes; at least, that is supposed to be the cause of his peculiar views on photography in general. The real reason is, we believe, that Dr. Emerson is labouring under some optical narcotic which confuses his ability to see sharply. . . . We do not know (and our experience is considerable) of a single disciple of narcotic photography in America, and we do not think that there is any likelihood of such a freak being found on our shores even by the incisive and alert proprietors of the dime museums, we are in focus." Articles: "Enoch Arden" (illustrated), "Convenient Warming Apparatus," "Figures in Photographs, and Incongruities Otherwise," "Photography Abroad," etc. There is a beautiful print, entitled "Sweetness," as a frontispiece.

Exhibitions.

THE WEST LONDON SOCIETY'S EXHIBITION.

This young but rapidly growing society held its first annual exhibition of members' work at the Addison Hall, W., on Friday and Saturday, the 10th and 11th inst. The exhibition, as a whole, presented an attractive appearance, and the exhibits in regard to quality were fully up to the average, but we note with some regret that the majority of the exhibitors content themselves with very small work. We do not mean to suggest that a small picture may not equal, in every respect save size, one of large dimensions, yet the effect when a number of quarter-plates or 5 by 4 in. pictures are exhibited together upon a screen can rarely be otherwise than "spotty."

We understand from the Secretary that he experienced considerable difficulty in inducing the members to compete. If this were so, we consider it a circumstance very much to be regretted, for we hold it to be the bounden duty of every member to contribute something towards the success of the exhibition. We regard healthy, public competition as being one of the most valuable incentives to the production of good technical and artistic work.

The society is to be congratulated upon its good fortune in securing such central and commodious premises as the Addison Hall for its place of meeting. The hall itself was well lighted, the pictures being shown to great advantage, and the fact that the whole of the hanging was done on the Friday in time for the judges, Messrs. George Davison, F. P. Cembrano, and F. M. Skipworth, to perform their duties by daylight, speaks well for the energy of the executive.

In Class 1 (landscape, half-plate and under) some very good work was shown. Walter L. Colls took the President's silver medal and also the first bronze medal for a frame of quarter-plate Dutch landscapes. These are distinctly Emersonian in treatment, which may perhaps account for the award. In our opinion there was more deserving work shown. G. F. Blackmore gained a well-earned medal for "The Silver Lining," a most charming effect; "Romney Lock" was also good, but with "Eventide" we confess we were not so well pleased, the dark corners being suggestive of defective covering power in the lens employed. The third bronze medal goes to J. A. Hodges for three delicately-treated Welsh views in platinum, of which we consider "Conway Quay" the best. A series of Thames views, by J. Wilson, showed good treatment, but were rather spoilt by over-printing; the style of mounting also tended to lower the tone, and we fancy the prints shown did not do full justice to the negatives. L. C. Bennett showed some delicately-vignetted silver prints of views in Wales. Henry Selby's "Grey Morning, Dovedale," was the best of a good series. The last three exhibitors should run the medallists very closely in future competitions.

In Class 2 (landscapes larger than half-plate) there was practically no competition, and we are at a loss to understand why a medal should have been awarded to a very ordinary view in platinotype of a rather hackneyed subject, "Pont-y-pair, Bettws-y-coed," by W. L. Colls.

In Class 3 (small architectural views) J. A. Hodges took the medal for a view of Conway Castle and two interiors at Plas-

Mawr. These subjects were well chosen and fully merited the award. Wyndham Rickford showed good clean work in regard to technique, but some of his pictures were not well composed. Some tiny ecclesiastical studies by Leslie Selby also showed promise, though such subjects are more suited to larger-sized plates.

In Class 4 (large architecture) C. Whiting obtained a medal for a fine 10 ins. by 8 ins. view of "Exeter Cathedral Choir." Some views of "Holland House," by Chas. Dixon, were very interesting, and exhibited good technical ability. "An Interior," by T. S. Hazeon, was very much under-exposed, and the contrast between light and shade was far too great. His "Bedford Park in Winter," however, was a very charming subject.

In Class 5 (portraiture) J. Hyatt showed a beautiful study of a girl's head, which, however, appeared not to have attracted the attention of the judges.

In Class 6 (groups) some interesting photographs of Chinese life were exhibited by S. Tingfau Chang, of the Chinese Legation, "Sister and Brother" being noteworthy.

In Class 8 (genre, or figure pictures) no award was made, although some photographs of considerable merit were exhibited. F. H. Low's "Dinner Time" was a charming study, and we think deserved some recognition. "Homeless," by G. F. Blackmore, was a suggestive picture, but rather lacking in vigour.

The action of the judges in withholding all the awards in the enlargement classes is, without explanation, rather difficult to understand, some of the exhibits being of considerable merit, both in regard to pictorial effect and technique. In the landscape class F. H. Low is the principal exhibitor; his "Barges at Kew," but for a technical defect in the sky, being a very fine picture. "In Cassiobury Park" we like even better, the "tonality" being good, and the subject charming; both pictures, however, would show to better advantage in darker frames. L. C. Bennett's "Bettws-y-Coed" is well executed, but a trifle over-exposed. J. A. Hodges' "At Aber" is unsuitably framed, and not pleasing in colour. In the Genre Class F. H. Low's exhibits again attract attention. In "A Quiet Chat" the technique is good, although the grouping is at fault, the figures being scattered; we have, in fact, in this picture, two separate studies. "Watching the Amateur," by L. C. Bennett, is a good study—the difficulty of avoiding hardness in photographing a white-washed wall having been very skilfully overcome. Three enlargements by G. E. Varden are very soft and velvety in tone. "Spinning the Top," by J. A. Hodges was, in the opinion of the judges, more a painting than a photograph—a rather severe criticism on the few brush touches which have been made. J. Martin Dickens shows a very good portrait enlargement which would put a great deal of professional work to shame.

In the lantern-slide section no award was made in the landscape class, though many of the slides were quite of average merit, a set by J. Wilson and one by L. C. Bennett being of very high quality.

In the architectural class C. Whiting obtained a medal for a series in wet collodion. These, although showing good technical work, were thin and lacking in vigour; a series by J. A. Hodges rather suffering in the opposite direction. No awards were made in the remaining classes.

Upon the whole, we consider we have reason to congratulate the executive of the West London Photographic Society upon the success of its first exhibition, and we shall look forward with pleasure to inspecting and criticising the productions of their members at future exhibitions.

* * * *

BIRMINGHAM PHOTOGRAPHIC EXHIBITION.

THE Birmingham Photographic Society held their annual exhibition (open to amateur members only) on Tuesday and Wednesday last, January 21st and 22nd, in the Temperance Hall, Temple Street. There were twenty-two classes, but of these two attracted no competitors; and in two others (stereoscopic and photo-micrography) there was only one exhibitor. The total number of exhibitors was thirty-nine, and the number of pictures shown exceeded 400—remarkably good for a young society holding what is practically only its second exhibition. The judges were Messrs. Geo. Bankart, P. C. Cembrano, jun., H. S. Fry, (Rev.) F. C. Lambert, P. Lange, A. Pringle, H. P. Robinson, and A. Stroh—quite a galaxy of talent. The awards were as follows:—

Class 1 (Instantaneous).—Silver medal, W. Jerome Ferriss;

honourable mention, G. J. Sershall. The prize frame is a whole-plate of "Leap-Frog."

Class 2 (Landscape).—Silver medal, E. H. Jaques; honourable mention, J. C. Huxley, H. G. Sears, E. C. Middleton. The winning print is a fine platinotype, in which gradations of distance, from a brawling stream in the foreground to distant snow-clad mountains, are most beautifully expressed. A large class.

Class 3 (Best Developed Contact-print).—Silver medal to E. C. Middleton (for "A Gloucestershire Farm" in platino); hon. mention, C. J. Fowler.

Class 4 (Transparencies).—Silver medal to W. Rooke ("Dove-dale"); hon. mention, B. Karleese.

Class 5 (Genre).—Silver medal, E. C. Middleton ("Village Gossips"); hon. mention, H. G. Sears, C. J. Fowler.

Class 6 (Interiors).—Silver medal, E. H. Jaques ("Coleshill Church"); hon. mention, G. Wilkes, B. Karleese, W. Rooke, C. H. Palethorpe, A. J. Leeson.

Class 7 (Prints from Film or Paper Negatives).—Silver medal, J. H. Pickard ("Fly-Fishing, Dovedale").

Class 8 (Enlargements).—Silver medal, F. Pike ("Near Dux-ford-on-Thames"); hon. mention, W. Jerome Harrison.

Class 9 (Portraiture).—Silver medal, C. J. Fowler ("Mr. John Warner"); hon. mention, H. G. Sears.

Class 10 (Lantern Slides).—Silver medal, A. R. Longmore; hon. mention, E. H. Jaques, W. Rooke.

Class 11 (Seascapes).—Silver medal, E. H. Jaques ("Sunrise in Norway"); hon. mention, F. Hoskins, W. Jerome Harrison, G. J. Sershall, H. R. Leech, J. H. Manly.

Class 12 (Architecture).—Silver medal, J. C. Huxley ("Chiddingstone").

Class 13 (Stereoscopic).—Hon. mention, G. Wilkes.

Class 15 (Animal Studies).—Bronze medal, C. Phillips; hon. mention, C. H. Palethorpe.

Class 16 (Reflections).—Prize to H. W. Southall.

Class 17 (Street Trades).—Prize to E. C. Middleton.

Class 18 (Obernetter or Aristotype Print).—Silver medal to E. Hendren.

Class 19 (For Beginners).—Hon. mention, C. J. Fowler.

Class 21 (Best Film Negative).—Hon. mention, H. W. Southall.

The President of the Society (J. B. Stone, Esq.) gave a short address on the first night; and there was a capital lantern display on each evening, the optical lantern being most ably manipulated by Mr. E. Howard Jaques.

The exhibition was well attended, although the weather was against it. The pictures were declared on every hand to represent a very great advance since last year, and to show the capital work which the Society is doing in Birmingham. Considering that the show was this year a strictly "society" and "amateur" exhibition, we consider the general average of work good and commendable. A large proportion of the pictures were in platinotype. The Secretaries of the Birmingham Photographic Society (Messrs. J. H. Pickard and A. J. Leeson) worked hard to deserve success; and so, too, did the Exhibition Committee (Messrs. Harold Baker, E. H. Jaques, B. Karleese, S. G. Mason, and W. S. Horton). Mr. Baker—whose artistic work is now well known—sent a fine series of portraits (not for competition). Next year we trust to be again favoured with an invitation to visit Birmingham, and we feel sure that if the local society then decide to promote an "open" exhibition (including apparatus, etc.), it will, with the experience now gained, be a complete success.

WE have received a catalogue of apparatus and chemicals from Mr. A. E. Atkins, chemist, of Newport, Mon. The list is a full one, and certainly sufficiently so to prevent the traveller carrying plates, chemicals, or minor apparatus with him to that neighbourhood.

THE MODEL CAMERA.—In answer to numerous queries, we are able to state that Mr. James Braine, 22, Bedford Terrace, Moray Road, London N., is the sole maker of the "Model" (Combination Hand and Pocket Tourist's Camera), as described in the AMATEUR PHOTOGRAPHER of 13th ult.

"PHOTOGRAPHIC MOSAICS FOR 1890" keeps up its character for style and utility. All the articles are short and to the point, and all questions of interest to the amateur are dealt with by contributors from all parts of the globe. There are a number of good process reproductions which add to the attractiveness of the book.

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

ABNEY CAMERA CLUB.—At the ordinary weekly meeting of the above, held on January 17th, after the discussion of a couple of questions from the box, the Hon. Sec., Mr. F. H. Leeds, A.I.C., read a paper on "The Chemistry of Photography." The lecturer confined his attention to the theoretical consideration of the every-day manipulations of photography, elucidating the chemical symbols and equations by means of a black-board. The paper was listened to with great interest by the members present, and at the close a hearty vote of thanks was proposed by Mr. F. W. Hart, F.C.S., seconded by Mr. Hibberd, who both fully endorsed a remark made by the lecturer, that no one could hope to be a uniformly successful photographer without considerable acquaintance with the theoretical side of the subject. The discussion was postponed till January 24th.

BRIGHTON PHOT. SOC.—The usual meeting was held on January 14th, the President in the chair. After the usual business had been transacted, Captain Barnes gave an address on "Photo-Micrography," which was listened to with interest by those present. Captain Barnes illustrated his remarks with several lantern slides, and a number of excellent negatives, chiefly taken on Carbutt's celluloid films. He also showed lantern slides made on Carbutt's transparent films. These were examined with much interest. A hearty vote of thanks was accorded Captain Barnes for his paper.

BRIXTON AND CLAPHAM CAMERA CLUB.—The usual fortnightly meeting was held on the 17th inst.; Mr. Coade in the chair. After the formal business of the evening had been disposed of, Mr. H. J. Green read a paper on "Bromide Printing," afterwards demonstrating the process. A letter was read from Dr. Emerson offering the society a copy of his work, "Pictures of East Anglian Life," which kindness was unanimously accepted.

GLASGOW PHOT. ASSOC.—The third general meeting of the session was held on the evening of Thursday, January 16th, in the rooms of the Philosophical Society, 207, Bath Street, Mr. William Lang, jun., F.C.S., President, in the chair. Mr. John Annan showed two volumes of calotypes printed in 1844-45, and several of the original negatives from which the prints had been made. Mr. Fred. Mackenzie gave a demonstration of timing speed of drop shutters by means of a tuning fork. Mr. Wm. Lang, jun., read a communication, "The late Cuthbert Bede, and his work, 'Photographic Pleasures.'" The whole of the various sketches in the volume by the author were shown by means of the society's lantern. Mr. L. N. Armstrong afterwards exhibited his new illuminating chamber for photographing at night by means of coal-gas. Copies of Mr. Lang's paper "Fifty Years' Photography, 1839-89," communicated last session, and printed at request of association, were afterwards distributed to the members present, as also tickets for forthcoming popular meeting, "Paris and its Exhibition," by ex-Provost Clark, of Paisley.

HALTWHISTLE AND DISTRICT.—A special meeting was held on the 17th January for the purpose of exhibiting the lantern slides kindly lent for the occasion by the Editors of *Photography*. A number of members' friends were also present. Major Anne, the President, lent his lanterns, and also assisted in their manipulation. The slides were very much appreciated, and the frequent applause was evidence of the pleasure they afforded the members. They were an excellent collection, the range of tone being wonderful without the aid of additional colouring. Votes of thanks to the Editors of *Photography* and to Major Anne terminated the meeting.

LANCASTER PHOT. SOC.—At a meeting of the above Society held on Tuesday, January 14th, three new members were elected. After the ordinary business of the meeting, Mr. T. Hall gave an interesting lecture on bromide printing accompanied by practical demonstration in the art. Exposure was first dealt with, followed by development; Mr. Hall's thoroughly practical manner of dealing with the latter process being watched with great interest by the members present. In all, four prints were dealt with; the results obtained were most satisfactory. A discussion took place on various points raised during the lecture, such as

best kind of negative to use, choice of developers, light etc.; and led to much useful information being obtained. At the close a hearty vote of thanks was passed to Mr. Hall for his lecture. The Secretary gave notice that at the next meeting (February 11th) a paper would be read on "Eikonogen."

LEICESTER AND LEICESTERSHIRE PHOT. SOC.:—A regular meeting of the Society was held on the 8th inst., the Vice-President (Mr. S. S. Partridge) in the chair. One member was balloted for, and unanimously elected, and one member proposed for ballot at next meeting. The election of officers for 1890 was then proceeded with, the following being the result: President, Mr. S. S. Partridge; Vice-President, Mr. J. T. Cook; Treasurer, Mr. W. Sculthorp; Secretary, H. Pickering (High Cross Street); Committee, Messrs. Sculthorp, Wilson, Pierpoint, Porritt, Leeder, F. Brown, Blackwell, and Bankart. It was decided to offer the following medals for competition among the members for the ensuing session:—Silver and bronze medals by the Society, for the two best sets of six lantern-slides; silver and bronze medals by the Society, for the best and second best six prints, whole-plate; silver and bronze medals by the past President for prints under whole-plate; and silver and bronze medals by the President for quarter-plate prints. It was arranged that the competitions take place as under:—Lantern slide competition at the February meeting; enlargement competition at the March meeting; print competition at the April meeting. Mr. Pierpoint proposed, Mr. Joliffe seconded that a small sub-committee be formed to arrange the details of excursions. The following were proposed on the Sub-Committee: Messrs. Pierpoint, Porritt, and Bankart. The conditions of competition as arranged for last year were accepted.

MANCHESTER AM. PHOT. SOC.:—The monthly meeting was held in the Athenæum on Tuesday, the 14th inst., Mr. Flower presiding. The President stated that the annual exhibition of the society would be held in the Manchester Athenæum in the middle of February. Mr. McKellen exhibited his latest detective camera, and a plate magazine which promises well to satisfy a long-felt desideratum among photographers. The magazine is an ingenious piece of mechanism, too simple to get out of order, and fitted inside the camera without increasing the size of it. A dozen plates can be stored in the camera. Mr. McKellen stated that now he never thought of using a tripod for outdoor work. Several of his friends had sent him specimens of some excellent work done with this camera. By means of a "finder" he could take a picture as well carrying the camera under his arm or holding it in front of him. The plate magazines are made to fit any other camera; and other lenses could be fitted to this detective camera. The days of dark-slides are now evidently numbered for outdoor photography. No one would think of filling his bag with them when the same space may be filled with plates ready sheathed for the plate magazine. A quarter-plate camera, charged with twelve plates and shields ready for use, weighs six pounds. Mr. McKellen's improvements were applauded as he explained them. An exhibition of slides giving charming views of Holland followed. The meeting was the largest during the season.

OXFORD PHOT. SOC.:—At a meeting of this society held on the 16th inst., a very interesting paper was read by Mr. E. T. Shelton on "Enlargements," illustrated by the enlarging lantern. The process of daylight enlarging was also fully explained by diagrams on the blackboard. The paper was very much appreciated by the members, and a hearty vote of thanks was unanimously given to Mr. Shelton. Some very good samples of enlargements on bromide paper were sent for inspection by Messrs. Fry and the Eastman Company. The next meeting will be held February 6th.

WINDSOR AND ETON PHOT. SOC.:—On January 15th an entertainment was given in the large hall of the Albert Institute, consisting of an exhibition of ninety slides of various subjects. The slides were divided into sets, for each of which a short description was prepared by the Rev. A. H. Blake, M.A. The first series comprised views of Moscow and other parts of Russia, and interesting local views, some taken recently and some at the time of the Jubilee and Agricultural Show. One picture of the lower ward and Round Tower (Windsor Castle) was taken by a member when out with the Phot. Convention during their summer visit to Windsor. On the conclusion of the first series, the Mayor of Windsor (Mr. J. L. Hollis) ascended the platform and read the "Ancient Mariner," and as he read, the lantern operator projected pictures (twenty-seven altogether) upon the screen

illustrating the text. The Rev. A. H. Blake, starting from Windsor Bridge, led the audience a charming ramble round by the locks, through Windsor Castle, up the Long Walk, past Frogmore, the double gates (summer and winter scenes), the Copper Horse, through Virginia Water, then to Runnymede and other places of interest on the river banks, making his way to Burnham Beeches, and coming home by Old Repton church. Each point in his narrative was illustrated by photographs on the screen. The next part of the programme consisted of microscopic slides. The last section of the programme consisted of military and naval scenes, including H.M.S. Victory, portraits of Lord Wolsley, Col. Burnaby, the Charge of Kassassin, and battle of Tel el Kebir, finishing up with the portraits in a group of the survivors of the Balaklava Charge, taken last year by a member of the society. With the exception of the two views of Kassassin and Tel el Kebir, which were necessarily taken from paintings, and therefore showed somewhat faintly, all the slides were of first-class order, and were repeatedly applauded by a full hall.

“Thursday Evenings” at the Camera Club.

BY ONE OF OUR STAFF.

THE meeting on Thursday, the 16th inst., was a most interesting one, and it is to be regretted that the attendance of members was not larger, though this may possibly be due to the fact that the members who stayed away know all about light and its action, and so felt it to be quite unnecessary to run up for the purpose of hearing Mr. R. Tindall discourse on "Plane Polarisation of Light." It is perfectly true that the lecture was essentially an elementary one, but it is possible that it may be only the first of several which Mr. Tindall may deliver before the members of the Club. The lecturer was provided with an efficient lantern supplied with the limelight, and by means of it he graphically illustrated on the screen most of the points touched upon in the course of the evening. He showed the double image given by Iceland spar, and the curious effect of one image being obliterated when the spar was turned so that the pencil of light struck at a certain point. The "quenching" or oblitative effect of tourmaline was also shown, and Nicol's prism explained and experimented with. Pointing out that colours were caused by the different wave lengths of a ray of light, Mr. Tindall showed how certain colours could be obliterated by double refraction from films of different thicknesses and substances, as mica, selenite, soap-bubbles, etc., the colour left by the film being always complementary to the colour obliterated from the spectrum. Some very pretty experiments were given in illustration of this; images of church windows, butterflies, etc., made of substances which quenched certain colours were thrown on the screen, and on the figures being turned round the colours on the screen changed to their complementary colours. These experiments were all shown with polarised light, ordinary light not having the same effect. Crystals of tartaric and benzoic acid and salicin threw most gorgeous prismatic patterns on the screen. In concluding, Mr. Tindall said that certain light reflected from the sky was polarised, and suggested that the interposition of a Nicol prism in such cases would enable delicately shaded flowers to be more correctly and satisfactorily photographed than was the case at present, and he showed two cloud negatives, one taken with and one without the interposition of the prism, and the difference was marked. Of course, the exposure had to be longer, as the amount of light was reduced by the prism.

The Chairman, Mr. H. M. Elder, in thanking Mr. Tindall for his able and interesting lecture, said the facts put before them might be found useful to them in their photography. He had been hoping that there would have been a good discussion, but the immensity of the subject seemed to have overwhelmed the members. He hoped they would have many such scientific papers read before them, which, if they did not bear absolutely on photography, would enable them to use their instruments to the best advantage.

On Thursday, January 30th, Mr. T. R. Dallmeyer will read a paper "On Some Practical Deductions from the Law of Conjugate Foci."

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editors, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3382. Framing.—I want (in my leisure time) to learn picture-frame making. Is there a book to be had on the subject; if so, where? Can any of our readers tell me how to bronze or gild on wood or paper, and how to clean old gilt or bronze frames?—**D. O.**

3383. Focus.—I have two half-plate portrait combinations, and want to use them in a binocular lantern, but they differ slightly in focal length, and used thus give discs slightly varying in size. Can some one tell me if by remounting or otherwise I could equalise their focus, so as to work them together?—**GEO. RATHBONE.**

3384. Magnesium Light.—In photographing by magnesium light I could not get a sufficient exposure without burning as much as 4 ft. of ribbon. How is it possible to photograph by flash light if this takes so long? Or have I made some mistake? No text-book enlightens me. There were two alcohol-gas burners in the room at the time; do they affect it at all? The camera used was Lancaster's Instantograph.—**IGNORANCE.**

3385. Dust on Negative.—I was photographing by magnesium light one night. The plates, when developed, presented an appearance, on being held up to the light, of having been dusted over with fine sand. What is the cause? Is it the consumed magnesium dust flying through the room, and, if so, how is it to be avoided? I used magnesium wire about two or three feet off camera. Can it be remedied, as the print is spoilt taken from it.—**IGNORANCE.**

3386. Flashing Light by Electricity.—I should be glad of any hints as to making exposures and flashing light by electric current, instead of by pneumatic means, as is usually done.—**ELECTRA.**

3387. Print Changing Colour.—Want to know cause of prints turning brown on being immersed in fixing bath, strength of which is

Hypo	...	...	4 ozs.
Sulphite of soda	...	...	20
Water	...	...	1 dm.
Ammonia	...	...	10 per cent. sol.

having come out of toning bath a good purple?—**TYRO.**

3388. Single Lens.—I intend to purchase a good single lens for landscape and shutter work. Could any brother amateur give me his opinion of Messrs. Taylor, Taylor, and Hobson's rapid-view lens, and if the half-plate size could be used on a quarter-plate double extension camera?—**W. S.**

3389. Burnishing.—Will any kind reader give me any information as to burnishing photographs?—**FLUSH.**

3390. Whole-Plate.—Some time ago a correspondent mentioned having had an extension fitted to the back of a half-plate camera, by means of which he could insert a whole-plate dark slide. Could he or any other brother kindly tell me where I could get this done for a reasonable sum?—**NORMANDY.**

3391. Loan of Negatives.—Will some kind reader please lend me some negatives of views and natural history subjects, to make lantern plates from for charitable purposes? I will pay cost of carriage, and return them.—**J. A. WATSON.**

3392. Lantern Slide Making.—Can any reader give details of the enamelled albumen process for

making lantern slides? Is it a wet process, and is it suitable for an amateur?—**SICILIAN.**

3393. Lantern Jet.—Can any one kindly let me know where I can get jets for the optical lantern made? I want to employ some person who actually makes the jets to do some special work for me.—**OPTICAL LANTERN.**

3394. About Ilfracombe.—I am going to Ilfracombe in February for ten days. Will any reader kindly oblige with particulars of the town for photographing? Is there any conveyance to the villages in the neighbourhood at this time of the year? Thanking in advance.—**INSTANTO.**

QUERIES UNANSWERED.

Dec. 6th.—Nos. 3274, 3277, 3283, 3284, 3285, 3289, 3290, 3291, 3293.

13th.—Nos. 3297, 3298, 3300, 3302, 3304, 3305, 3306, 3307, 3312, 3314.

20th.—Nos. 3318, 3319, 3321, 3324, 3325.

27th.—Nos. 3330, 3332.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3353, 3354, 3356, 3358, 3359, 3364, 3366, 3367.

17th.—Nos. 3339, 3370, 3371, 3372, 3375, 3376, 3378, 3379.

ANSWERS.

3351. Spotted Prints.—Evidently either the negative or the paper was damp. Remedy; take care the negative is thoroughly dry, and as an extra precaution for this time of the year, when it takes a good time to print, give it a coat of varnish.—**EDYLLION.**

3352. Detective Camera.—Certainly not a wide-angle lens. As good a lens as any is the orthopan-actinic rapid rectilinear of Newton, of Liverpool; back focus, $7\frac{1}{2}$ ins., price 50s. I have one of these lenses; it gives wonderful definition, and I would not part with it on any account.—**EDYLLION.**

3352. Detective Camera.—The lens for use in half-plate camera should be selected according to the chief object for which it is wanted. For rapid work a wide-angle lens is not sufficiently rapid. A medium angle lens is best, and about $7\frac{1}{2}$ in. focus. If "G. K. I." will look up my article in "Year Book" it may help him, or write me direct, per Editors.—**C. HETHON LEWIS.**

3357. Exhibition Matters.—Yes. Cut out card mounts any tint, according to taste. Plain oak frame. Half-plate and under four can go in one frame, above that it is best to have a frame for each. Write to the different secretaries for conditions and other information.—**EDYLLION.**

3360. Covering Power of Lens.—From what you say I should imagine your lens was only a half-plate, and not a whole-plate one.—**EDYLLION.**

3360. Covering Power of Lens.—The farther you remove the camera from the sitter the nearer the lens will have to be to the ground-glass, but the farther you go from your sitter the smaller the image will appear. You must reduce distance between lens and ground-glass till the subject is quite sharp. Your camera is all right if the front will push back towards the ground-glass. The only method of obtaining a finished photograph at once is to enlarge direct on bromide paper.—**EDYLLION.**

3361. Silver-Ring Rectilinear Lens.—A first class lens is wanted. "Advanced" says. The one mentioned is doubtless good, but I can personally recommend Swift's or Taylor's, as I have both these makes of lenses.—**HETHON LEWIS.**

3368. Halation.—The simplest way to avoid halation is to back your plate with ordinary black American cloth, smeared with glycerine to make it adhere. Before development it can be easily stripped off, and the glass wiped with a clean cloth. I saw this recommended in a former number of the **AMATEUR PHOTOGRAPHER**, and found it answer perfectly.—**S. JAMES.**

3368. Halation.—"Mit Eur" should get soem "Halatine" sold by Mr. H. Pickering, chemist, Highcross Street, Leicester, which effectually prevents halation. It simply requires dabbing on back of plates before insertion in slides. It is sold in bottles about 1s. each, 1b. 1s. 6d.—**WALTER B. WOODLAND.**

3368. Halation.—"A. Mat Eur" can entirely prevent halation by coating the backs of his Ilford plates with the following preparation:—Obtain a small quantity, say three-pennyworth, of burnt sienna pigment, ground in water, from a colourman, and put in a small red pan such as painters use; add to it about a teaspoonful of glycerine and a little strong gum. Mix thoroughly with enough methylated spirit to bring it to the consistency of cream. With a small flat camel-hair brush, say an inch wide, coat the backs of the plates, and as each is finished, stand it in a plate rack, which should stand in a dark cupboard or box in the dark-room all night. Don't forget that the plates are still sensitive, and in the morning put them into your dark slides. Two days ago I photographed the interior of a church, pointing my camera directly at a large window, and using an Ilford plate backed as above. The negative shows no trace of halation whatever.

Of course, the red paint must be removed before the plates are developed, but a damp cloth or sponge will readily do this. To use an Ilford plate without backing for such a purpose as an interior, would be simply to waste plate, time, and temper.—**E. HADLOW SUGGATE.**

3368. Halation.—The following composition, if spread upon brown paper (which has been damped) and thus applied to the back of the plate, will answer the purpose of preventing halation:—Powdered burnt sienna 1 oz., gum 1 oz., glycerine $\frac{1}{2}$ oz., water 10 ozs. Another method of backing which is more convenient than the above is to rub a little glycerine over a piece of black enamel paper or red paper, similar to that in which plates are wrapped, and then pressing it firmly to the back of the plate. All backing must be removed before development. Halation is less likely to appear with quick development and with a thickly-coated plate or one containing iodide.—**SICILIAN.**

3373. Mounting Prints.—See letter in this number.—**HETHON LEWIS.**

3374. Platinum v. Gold.—Although platinum tetrachloride is less than half the price of gold chloride, it is not so generally used, for one atom takes the place of three atoms of silver subchloride, whilst two atoms of gold take the place of three; so that there is not so great a loss of tone with gold as with platinum. A print that is to be toned with platinum must, therefore, be printed very much more deeply than one to be toned with gold. No doubt platinum will come into use more extensively now in the form of platinum chloride, thanks to the recent investigations of Mr. Lyonel Clark.—**SICILIAN.**

3377. Detective Cameras.—If "Detector" really wants to obtain a good detective camera, and does not mind going to the expense of £10 or thereabouts, he might get "The New Instantaneous Hand-camera," which holds a dozen quarter-plates, which can be exposed without being touched by the hand. There is an indicator to show how many plates he has exposed. He can get the camera and everything for nine guineas ebouise, or, if he prefers it in morocco, for ten guineas.—**JOHN H. MONTAGU.**

3377. Detective Cameras.—Rough's Eureka, quarter-plate size. It is about perfect. I have used it on figure, marine, landscape, and architectural subjects, and had the opinion of very good professional photographers on the results technically. They all say the work is excellent.—**NOR-EMAN.**

3380. Transparencies, Painting of.—Photographic transparencies can be coloured in a variety of ways, either by oil or water-colours. The following are transparent oil colours.—Prussian blue, indigo, Antwerp blue, French ultramarine, Italian pink, yellow lake, burnt sienna, crimson lake, ivory black. Robinson's medium used with turpentine is good for mixing the colours, which should be applied with water-colour sables. The most difficult part will be found to be in getting the colours, over open spaces, to lie evenly and not to reveal the marks of the brush. Here a dabber must be used, consisting of a short thin stick having a piece of kid lined with cotton wool tied tightly to one end; the colour can be spread evenly with this by giving a succession of taps.—**SICILIAN.**

3381. Camera on Bicycle.—I carried my quarter-plate Instantograph last summer on a Humber safety, taking the camera, slides, etc., in a case on an ordinary iron carrier affixed to the front of the machine. The tripod when folded up just fitted into the opposite corners of the diamond frame. I would not advise "C. T. C." to invest in a cycle clip. I should like to know where the advantage of its use lies when attached to a safety bicycle. A tripod makes you perfectly independent and free to choose your point of view.—**SICILIAN.**

3381. Camera on Bicycle.—"C. T. C." will find Matthews' carrier very suitable for his purpose. It can be obtained at any respectable cycle dealer's. Any short folding tripod will do strapped to the handle bar or backbone. I should think a cycle clip would not answer, as you would always have to lean the machine against something.—**F. JACKSON.**

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatuses, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—**EDS. AM. PHOT.**

C. NOWELL-USTICK.—We do not think the camera you name is at present on the market. No. 1 is a very reliable lens. No. 2 is well spoken of, and some experts hold very high opinions of the quality of the glass.

D. FORBES (Smyrna).—Accept our congratulations upon the excellence of your work. We are pleased with the colour you have secured in the prints by means of Dr. Kibbler's process. We shall take an early opportunity of sending them to him for inspection, and we are sure he will be pleased that he has followers working at such a distance from England. From an art point, your photographs have considerable merit, and when we consider the disadvantages you have laboured under,

we are quite surprised at the result before us. We should say you err slightly by over-exposure. The grouping in No. 1 is capital. If more detail had been brought out in No. 6 it would have been a very pleasing panorama. Nos. 2, 3, and 4 show again your ability in grouping. We shall be pleased to see more of your work.

H. R. HIDE.—We know few professional photographers, and cannot therefore help you. Can only advise you to advertise in one of the trade journals.

C. MILLARD (Malta).—A book of "entry forms" for the monthly competitions will shortly be issued. The particulars of these are now advertised up to September. The Newspaper Act will not permit of our inserting a form in the paper loose to be filled up. We hope, therefore, we have now overcome the difficulty in a great measure. The two photographs you send have but little merit, and the enlargements are an exceedingly bad colour; we shall be pleased to give you some advice if you will send us more particulars than are contained in your letter. If you have difficulty in securing the AMATEUR PHOTOGRAPHER through your bookseller, why not subscribe direct for it from the publishers?

ARGOSY.—Certainly you must not make a lantern slide of a photograph that is copyright. The copyright in a book is in force for forty years. We shall do our best to sustain our present position in photographic literature. Our publishers shall procure you a copy of "Photographic Answers," as requested. Sorry your letter has not received earlier attention.

J. W. DARLING.—We are glad to have your experiences in the making of silhouettes by the aid of photography, but do not think that the discovery (?) any way advances photography. Whatever value there attaches to a silhouette is due to the cleverness of the artist who cuts out in profile a portrait, but we much prefer legitimate photography to photography which only makes a poor copy of the work of a clever artist. In your case the profiles are very clearly defined, and no doubt are more truthful than the work of the "scissors artist."

W. E.—We should give the preference to A and B on your list.

W. J. W.—The maker carries on business at Bull Street, Birmingham.

F. J. T.—The lenses you forward were not made for stereoscopic work, but are French portrait lenses. Their full value, taking into consideration that one is much damaged, is about ten shillings the two. The blemish will not affect the performance of the lens to any noticeable degree—but reduces the commercial value of the article to a minimum. The lenses are hardly worth furnishing with stops.

J. B.—Your apparatus is quite correct in design. Limelight is quicker than paraffin, and it has some other advantages for enlarging purposes. The ground glass is unnecessary. Do not use a wide angle lens if you can help it.

J. B., Ayr.—It is quite impossible to say why you fail in your photography, but if you care to send up a negative, we will endeavour to find out.

W. H.—Enlargements are not indolent.

W. J. L.—We cannot see what you mean. The colour of the dog does not seem to us to be in any way different to the rest of the picture.

W. J. B.—Your church is not taken from the best point of view, and the straight foreground is very inartistic. The group—which appears to be a study for Moses in the bullrushes—is not a happy production, although it certainly is original. The idea of the young lady clasping the older one to prevent her committing suicide in the pond, is perhaps too gloomy an incident to introduce in a family group. The open view is better, but it lacks brightness. Bath is, we think, the nearest.

MRS. A.—Thank you for the pictures. Your work is good and clean, and the glaze all that could be desired.

G. F. D.—You should address your enquiry to some dealer in chemicals—say Mawson and Swan.

PLATINO.—The instructions issued by the Company are sufficient for most people; but you will find a good deal of information in the competitive papers which we published on the subject a few months back. The time of floating the paper is simply a matter of experience. The cameras named are of about equal merit. Choose for yourself.

ROBIN.—The lens is a good one, and you are safe in purchasing it; and we consider that the camera represents good value for the price asked for it.

H. H. S.—It is impossible for us to recommend one particular camera out of four of equal merit. This is surely a case in which a purchaser should exercise his own judgment.

L. C.—We reply to your enquiry by post.

A. W. P.—Your best plan will be to paint out the background round the head with gamboge (water colour), using with the colour a little oxgall. This should be done on the film side, and will be found quite effective if the colour is applied properly.

JIM CROW.—Certainly we will help you in the way you suggest, as soon as the society has been started.

JOHN H. S. RUSSELL.—We cannot at present fix the date, but hope to in a week or so.

UNDECIDED.—If price is no object, certainly get No. 2 on your list, or the corresponding lens of a maker of equal fame whom you do not mention. It is worth remembering that a first-rate name on a

lens stamps it with a value which renders it saleable at a high price at any time.

R. L. KINGSFORD.—Only three papers were contributed; none of them were considered worthy of the prize offered. The prize design has long since been decided upon and the prize forwarded. Your MS. is returned to-day.

J. R. D.—Your prints have been destroyed. Kindly send duplicates, and we will endeavour to give you further advice. Will keep your letter before us.

H. H.—You must not enter a print in Monthly Competition and then send same to our Prize Tour Competition. You can have the prints back when you please. They are not going the round.

T. S. MAYNE.—Will write the competitors, but fear they will not consent. Many thanks for your kind letter. Shall hope to pay you a visit some time this next summer.

J. H. MONTAGUE.—Your letter is hardly suitable for our columns, but the idea of a teaching club has often presented itself to us, and we will draw attention to your suggestion in "Our Views."

A. JOBLING.—You must write to the Sale and Exchange Department.

Monthly Competition.

NO. 8.—ENLARGEMENTS.

In the above Competition we have received competitive prints from the following gentlemen:—

1. An Industrious Fisherman ... J. J. Thornton
2. Dolly and I ... John Fraser
3. Waddesdon Manor House ... Wm. Rice
4. The Arundel Road to Horsham ... Edward Hawkins
5. A Rustic Bit ... B. Bullen
6. Portrait of a Little Girl ... T. W. Muncey
7. Within Eight Miles of London ... W. R. Cullley
8. Study of Italian Children ... Alfred Stieglitz
9. A Storm at Jersey ... A. R. Dresser
10. Toby ... J. O. Grant
11. On the Derwent, Ashopton, Derby ... J. J. Rix, M.A.
12. Avenue of Trees in Cobham Woods, Kent ... J. C. Johnson
13. My Study ... James Epps, jun.
14. Lumley Mill ... C. B. Douard
15. The Old Mill, Alderley ... P. Bersi
16. H.M.S. Sultan, After being Raised ... Clement Millard
17. What Love hangs by ... S. Francis Clarke, L.D.S.
18. Flowers ... George Sherriff
19. Warkworth Castle ... W. Hall
20. Winter Farming ... M. Whiteside, M.A.
21. Portrait of a Child ... H. J. Turney
22. Tilbury Fort, Essex ... E. P. Overton
23. The Village Forge ... Charles Heady
24. Laxey Wheel, Isle of Wight ... James Shaw
25. Trentham Hall ... E. B. Wain
26. The College, Cobham, Kent ... A. L. Spiller
27. Youth ... T. L. Buch
28. On the Conway ... W. J. Farthing
29. How ill poor Mother Looks ... G. Herklots Vos, M. 3.
30. Off to the Fishing Grounds ... H. Dudley Arnott
31. On the Roxy Road ... Ernest Straker
32. Lady and Child ... Fred. Mackenzie
33. Phoenix ... J. L. Mackrell
34. Furness Abbey ... Lumley Cator

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less, and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop,

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, vols. v., vi., vii., each bound; also vols.

viii., ix, unbound; the lot for 11s. 6d.—A. G. W., care of Baird, 15, Lothian Street, Edinburgh.

AMATEUR PHOTOGRAPHER, from August, 1888, to date; what offers in cash?—S., 41, Waldemar Avenue, Fulham, S.W.

Burnisher.—Capital burnisher, half-plate, 9s.; Apts view-finder, 2s. 3d.; six each quarter and half printing frames, with glass and pads, 6s. 6d. the lot; ruby lamp, light-tight plate box (quarter), Vever's plate-lifter and box lantern strips, 2s. 6d. the lot.—A. Simpson, 49, Grasmere Road, Lancaster.

Cameras.—Half-plate 84s. Instanto set (Underwood's 1888), new; bargain, 60s.—2, Hawthorn Villas, Slad Road, Stroud, Glos.

Lancaster's half-plate Instantograph 1889, complete, scarcely used; offers, cash only.—Taylor, Tannery, Marple.

Latest pattern half-plate mahogany camera, double extension, three double slides, new; 70s.—Sunderland, Smethwick.

Lancaster's quarter Instantograph, with many accessories.—For particulars, apply, C., 41, St. Stephen's Avenue, Shepherd's Bush, W.

Lancaster's quarter-plate camera, with four mahogany double slides, patent changing bag for half or quarter plate, with three-fold stand, cheap; £2 10s.—Thos. Hy. Hoggett, Castle House, Stockton-on-Tees.

Stirn's secret camera, smaller size; exchange.—Hardwick, Sadler Street, Wells, Somerset.

Lamp.—Dark-room oil lamp, with golden fabric and opal glass; cost 18s.; will take 10s.—Tiro, Stanton House, Highworth.

Lantern Slides.—Lantern slide apparatus, for making slides from negative; cost 15s. 6d.; price 7s. 6d.—Bentley, Low Baildon, near Leeds.

Dozen lantern transparencies of Cornish and other views, new; what offers in full-sized comic slides?—B., 4, Heanton Villas, Redruth.

Lenses.—For sale (property of gentleman lately deceased), one Lancaster's Rectigraph lens, new; cost 30s.—Apply, N., Mark's Library, Northampton. Excellent carte lens, by Squire, perfect definition, with Waterhouse diaphragms; 25s.—Arthur Norman, St. Osyth, Colchester.

Ross' 10 by 8 R.S. Caldwell's shutter for same, extra tube, with Iris diaphragm; cost £12 last June; take £8 or offers; approval; deposit.—H. Macdonnell, Cleveland Mills, Stockton-on-Tees.

5 by 4 set, every requisite for taking and printing photographs; lens worth money asked; 57s. 6d.; bargain.—L., Ferry House, Pulborough.

Optimus quarter portrait and enlarging lens, with rack and Waterhouse diaphragms, equal to new, gives brilliant definition; 15s.; what offers? No cards.—K., 38, Waldemar Avenue, Fulham, S.W.

Lens and Stop.—A good half-plate R.R. lens and stops; 30s.; open to offer.—A. A. Kilby, Mayfield, Bishopwood Road, Highgate, London, N.

Microscope.—Microscope in case, hardly used, and mahogany box, 8½ by 4½ by 4, with two trays, containing 24 slides, etc.; accept 50s., or exchange quarter-plate Instantograph and lens (1889 pattern) and three double backs.—E. J. Reynolds, Ley Farm, Ilford.

Sets.—Bargain; quarter-plate Instantograph camera, two double slides, one cycle clip, and one landscape lens, with rackwork mount, cost 47s. 6d.; take 20s. cash.—J. Chanot, 157, Wardour Street, London, W.

Quarter-plate special patent camera (Lancaster's), four slides, new, Darlot's No. 1 Hemispherique Rapide and quarter single view lens; price £4 4s. Whole-plate single view lens; 15s.—W. Hargreaves, 83, St. James' Street, Burnley.

Half-plate square bellows camera, lens, three slides double, reversible back; cash £2.—Leek, 60, Albion Street, Castleford.

Quarter-plate camera, long extension R.R. lens and stops, shutter, three double dark slides, folding tripod, in excellent condition; on approval, deposit; £4 15s.—Doublet's, 11, Moorgate Street, London, E.C.

7½ by 5 double extension leather bellows camera (by Hare, London), three double backs, with carriers for smaller plates, in good condition; £7. Suter's lens, aplanatic, series C; £2 2s. Folding tripod in case; 12s. 6d. Negative boxes, printing frames, and dishes for same.—Prue, Abington Street, Northampton.

Whole-plate outfit, Dales' best make, camera, multiplex back, double slides, tripod, etc., cost over £13 10s.; take £7 5s.; bargain.—J. W. Thorp, Knutsford, Cheshire.

Lancaster's 1889 quarter-plate Instantograph, lens, shutter, double slide, stand, as new; 34s.—E., 50, Milner Square, London, N.

Camera, half-plate, 1889 Instantograph, by Lancaster, in very finest order, and guaranteed genuine in every part, fitted with reversing back, leather bellows and double extension, Instantograph lens and shutter, Iris diaphragms, double dark slide, quarter-plate carrier, and double folding mahogany tripod, latest improvements; approval; 74s.—Cousins, 5, Stanley Villa, Bruce Grove, Tottenham.

Whole-plate camera and one double slide, new, cost £5, bargain 63s.; whole-plate lens, 15s.; and whole-plate tripod, 11s. 6d.—Slade, Slad Road, Stroud.

Shutter, lens, etc.—For sale, Right-about-Turn

shutter, fit hood up to 2½ ins., no tubing, 13s. 6d.; good c.d.v. portrait lens, with stops, 11s. 6d. Wanted, Querry's single-flap shutter, to fit hood 3½ ins.—Photo, Woolhampton, Reading.

Sundries.—Handsome American organ, 16 stops, 9 sets, 8 ft. 6 ins. high, 29 pipes, embellished gold and colour; £36; photograph three stamps.—67, Forest Road, Dalston.

Splendid trombone, 20s.; exchanges invited; letters only.—George Howard, 55, Percival Street, Clerkenwell.

Lancaster's shutter, film-holders, plate-holder, old stereo camera, printing frames, etc.; 5s.—Brown, 63, Stanbury Road, Peckham.

Tripod.—Whole-plate tripod stand, very light and rigid; also violin, splendid tone, cheap.—G. Kynaston, Downham Arms, Islington, London.

WANTED.

Cameras.—Quarter-plate Instantograph and time shutter, 1½ in. hood.—Ploss, 309, Liverpool Road.

Model paddle engine, brass boiler; 36s.; want quarter-plate camera.—Burt, 67, Forest Road, Dalston.

Camera, etc.—Quarter Optimus wide-angle camera or similar pattern, with four or five double backs.—Price to Lyddon, 22, Alexandra Park, Redland, Bristol.

Camera Case.—Half-plate leather camera case, with divisions and shoulder straps; about 13s.—Send particulars to F. 32, Binfeld Road, Clapham.

Dark-Slide.—Dark-slide, for quarter-plate Instantograph; exchange AMATEUR PHOTOGRAPHER, April, 1889, to date.—No. 10, AMATEUR PHOTOGRAPHER offices.

Lenses.—Half-plate rectilinear lens, Taylor and Hobson's, or Wray's, with or without Iris diaphragms and shutter; deposit; approval.—W. Cullen, 16, Arlington Street, Glasgow.

Pacea 5 by 4 true-view lens. — Langlands, Pleasance, Dundee.

Photographic Apparatus.—Photographic apparatus, in exchange for amateurs' American lathe.—G. Savage, Folkestone.

Sets.—Lancaster's half-plate Instantograph, with lens, tripod, and dark slide; exchange a quarter-plate set, quite new, and "A Manual of Palaeontology," by H. A. Nicholson, F.R.S.—Frank Duncan, 6, Grosvenor Road, Gunnersbury, Middlesex.

Good half-plate camera, lens, dark slides, etc., complete.—Spencer, Surveyor, Crawshawbooth, near Manchester.

NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the *Amateur Photographer* are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISEMENT DEPARTMENT.—All communications respecting TRADE Advertisements in the *Amateur Photographer* are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editors, *Amateur Photographer*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—To ensure insertion all Communications should reach the Editors on Tuesday.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the *AMATEUR PHOTOGRAPHER* have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

First Prize	... Silver Medal and £1 1s. 6d.
Second Prize	... Bronze Medal and 10s. 6d.

Photographs must be sent in on or before **Monday, the 10th of March**. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the *AMATEUR PHOTOGRAPHER*, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition." The Editors, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

28th	Subjects.
February	Apparatus.
March	Optics.
April	Action of Light.
May	Exposure.
June	Plates and Films: Their Development and After Treatment.
July	Printing, Toning, Mounting, and Finishing.
August	Artistic Effect and Composition.
September	Outdoor Instantaneous and General Photography.

All MSS. to be addressed to the Editors, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of the Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	... Feb. 14	... June 14.
LANDSCAPE WITH FIGURE	... Mar. 14	... July 14.
GENRE OR FIGURE STUDY	... April 14	... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	... May 14	... Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Prints for next competition, "Landscape or Seascape," must be sent in on or before the 14th day of February, endorsed: "Monthly Competition," the Editors, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

2nd EDITION. Now Ready, Crown 8vo, cloth. Price 5s., post free.

NATURALISTIC PHOTOGRAPHY

FOR STUDENTS OF THE ART.

By Dr. P. H. EMERSON, B.A., M.B. (Cantab.),

Author of "Pictures of East Anglian Life," "Life and Landscape on the Norfolk Broads," etc.

"The literary style of the work is excellent, and it contains a fund of useful information, conveyed in a pleasant manner. . . . Altogether, 'Naturalistic Photography' is a work which should be possessed and read by every one interested in the practice of photography."—*Photographic News*.

"Suffice it to say that the book is distinctive from any other book on photography, and there is reading worth study on every page."—*Photographic Journal*.

"Carefully thought out, ably written, boldly expressed, original in treatment, 'Naturalistic Photography' is a valuable contribution to our literature."—*Photography*.

"A most enjoyable book to every true lover of nature."—*Photographic Art Journal*.

FRIDAY, JANUARY 31, 1890.

[PRICE TWOPENCE.]

• OUR • VIEWS. •

"To hold as 'twere the mirror up to nature."—Shakespeare

WE are pleased to note that mainly through the exertions of Mr. H. P. Tattersall, a member of the Camera Club, a photographic society has been formed at Blackburn. Lancashire literally teems with workers in photography, and already some thirty or more gentlemen have handed in their applications for membership. A short account will be found in another column.

* * * *

MR. MACLEAN's effort, noticed in last week's AMATEUR PHOTOGRAPHER, to establish a Photographic Society at Croydon has, we understand, received considerable support, notwithstanding the fact that a protest has been issued by Mr. Charles Hussey, the Secretary of the Photographic Section of the Croydon Microscopical and Natural History Society, and which is published in our correspondence columns. We do not know how many members there are of the Photographic Section, but we do know that it is ridiculous to make the statement that that section is representative of the workers in photography resident in and around the borough of Croydon. There should be no difficulty in securing at least 100 amateur photographers to join the Croydon Camera Club, and an exhibition started under the auspices of such a club would, we feel sure, be a pronounced success. Some of the most charming landscape scenery in England is to be found within walking distance of Croydon, and there is material enough to satisfy the cravings of the most persevering and critical photographer that has ever used a camera. We therefore trust that Mr. Maclean will relax none of his efforts to establish a club which shall be truly and solely representative of photography. He has our hearty good wishes, and may accept our assurances that if in any way we can be of service to him he has but to command us.

* * * *

THE Dukinfield Photographic Society is fast becoming a representative society. We are pleased to note that it is intended to hold an exhibition of photographs by members and friends on the 20th, 21st, and 22nd of February. On the third day there will be a conversazione and lantern exhibition in the evening. The society numbers some

seventy or more members, the bulk of whom are active workers in photography.

* * * *

MR. PAUL LANGE, President of the Liverpool Amateur Photographic Association, delivered an excellent lecture upon "Norway" on the evening of the 24th at Birkenhead. The lecture was illustrated throughout by lantern slides made from Mr. Lange's own negatives, taken whilst on an extended tour through the "Land of the Midnight Sun" last year. An account of the lecture will be found in our correspondence columns, and will be of interest to many of our readers who contemplate visiting Norway next season.

* * * *

THE movement now on foot in certain quarters to unite as exhibitors the amateur and professional we deprecate most strongly. The amateur photographer has always been the pioneer in matters photographic, and advances the art and science on every hand. We would, therefore, ask why should he be compelled, for the sake of that section of photographers who wish to "run with the hare and hunt with the hounds," and who are neither "fish, flesh, fowl, or good red herrin'," to compete with traders, whose work, speaking from the experience of a constant visitor at exhibitions for the last five years, shows generally no advance either in art or in technique? Who are this precious body of professional photographers with whom the large army of amateur photographers all over the world are asked to throw in their lot? Is it not a fact that the professional photographers exhibiting at the photographic exhibitions which are promoted by amateurs whose exertions entirely make them a success, may be counted on the ten fingers? We say, stop these professional men from exhibiting, who practically show no advance in their work, but to whom, owing to the manner in which conditions are drawn up, judges are compelled to award expensive medals, which are paid for, not by professional photographers, but from contributions of the amateurs. Time after time are medals awarded to professionals for photographs not one whit better than work by the same men that have been exhibited any time during the last five years. At best, they are not photo-

graphs, but are, too often, badly executed paintings, false to nature and libels upon art.

By wiping such things for ever off the walls of photographic exhibitions the expense of supplying so many medals may be reduced, and the exhibitions purged of work that does not advance photography or gratify the public.

* * * *

WE are pleased to be able to announce that the competitors in the AMATEUR PHOTOGRAPHER "Stereoscopic Slide Competition" have kindly consented to allow us to loan the slides to photographic societies for inspection. A packing fee of *one shilling* will be charged, and Secretaries are requested to make early application. They will be at their disposal *after* the 14th of February. The prints will be on exhibit at our offices at 1, Creed Lane, from 10 to 4 on Thursday and Friday, the 6th and 7th February, and on Saturday the 8th, from 10 till 2 o'clock. We shall probably arrange for them also to be on exhibit on Wednesday evening, the 12th prox., from 7 to 10 o'clock, but will announce definitely next week.

* * * *

It gives us pleasure to announce that the following awards have been made for the "Enlargements," contributed to the AMATEUR PHOTOGRAPHER Monthly Competition No. 8—

Silver Medal—A. R. DRESSER,
for his excellent enlargement from hand-camera negative of "A Storm at Jersey."

Silver Medal—GEO. SHERRIFF,
for a very beautiful print from an enlarged negative of "A Vase of Flowers." The original picture was taken on an Isochromatic plate, and the gradation of colour is well marked, and becomes quite apparent in the print taken from the enlarged negative.

Bronze Medal—S. FRANCIS CLARKE, L.D.S.
This prize is awarded for a very charming study, "What Love hangs by."

Bronze Medal—J. L. MACKRELL.
Another study at the cottage door; an old woman and young girl being well posed and lighted. The enlargement is very carefully executed, and the picture well thought out.

The "Enlargements" have been on view for the past week, and have given much pleasure to a large number of callers. They will now "go on tour." Applications for them should be made *at once*, in order to save the cost of carriage.

* * * *

In our correspondence columns will be found a letter from the Hon. Secretary of the Camera Club containing the preliminary announcement of the arrangements for the Conference to be held in March next.

* * * *

THE Paisley Photographic Society will hold an exhibition of photographs in the picture gallery of the Free Library and Museum, opening on the 11th of February and continuing for one month. We are glad to notice that the Society will receive photographs "not for competition." The exhibition is for the advancement of members' work, and as a consequence is not open to general exhibitors.

THE promoters of the Crystal Palace Photographic Exhibition are most enterprising, and they are ably aided by the Company and their indefatigable Manager, Capt. Henshaw Russell. We have just received the following communication:—

"With the intention of securing for this Exhibition a thoroughly national character, the Directors have decided to offer a valuable Challenge Cup, to be retained for the current year by that photographic club or society which, in the opinion of the judges, sends the best collective exhibit of not less than fifty pictures. Appended you will find the conditions of this National Club Challenge Competition, and we shall be much obliged if you will kindly bring the matter before the members of your society without delay."

The rules are simple, and we should say that the liberal act of the Company will be appreciated. We shall be curious to see how many societies enter for the challenge cup. The announcement is made rather late. The ultimate destination of the cup is not announced. We would suggest that it should become the property of any society who may be awarded it three years in succession.

The Exhibition proper is progressing admirably, and we understand that dealers and manufacturers, especially in the provinces, will be largely represented.

* * * *

WE are pleased to note that the New York Society is making good progress, and that the papers read before it are of a high-class character. It is only twelve months old, but has already a good membership, with every promise of still further increasing its numbers. We refer our readers to another column for a report of the first annual meeting of the members.

* * * *

THE Liverpool Association still grows, and the members are doing most excellent work. Rumour says that they will promote an Exhibition next year (1891). Should this be done, we prophesy that it will surpass any provincial exhibition that has been held, and workers in photography, amateur or professional, will do well to get together some of their best work for exhibition. Liverpool did much at their former exhibition to revise and purify "rules and conditions," and we hope their Exhibition Committee for 1891, when formed, will take the whole subject of exhibitions in hand. Above all, we hope they will have no trade medals or prizes, and, as far as we are concerned, no medals outside those struck from the Association's own dies; that "sets series" will be disregarded, that the prizes in every case shall be awarded to one frame or one photograph; that no series, if they are admitted, should consist of photographs not connected either by incident or locality, and that in such a case it should be imperative that the series be in one frame, and exhibited as a whole.

THE Liverpool Amateur Photographic Association, in promoting an exhibition on the scale of that held two years ago, may well make the conditions stringent, and so give us an ideal exhibition. We hope also that they will have an historical section, and feel assured that those who have examples either of apparatus or actual photography, the work of "the fathers" will gladly entrust them to the Association. No association in England has more capable men on their Council, or whose muster-roll contains more able and talented workers in photography. We hope, therefore, for the good of photography in

general, and the advancement of the amateur photographer in particular, the Liverpool Association will take early steps to put the scheme of their 1891 Exhibition before the public.

* * * *

A NEW DISCOVERY (?)

WE have more than once had occasion to remark upon the revival of old processes, the unearthing of forgotten methods of working, and the re-introduction of obsolete apparatus under new names. It is natural that such a thing should often occur in an art like photography, for new workers are constantly coming upon the scene who are so busy in mastering the processes of to-day that they have little opportunity of looking back in order to see what has been done in the past. Hence many an ingenious one is led to devise some modification in his every-day work, and as he has a ready means of publishing his discovery or invention through the medium of the society of which he is a member, the improvement is soon well advertised by means of the journals, and the newly-fledged inventor holds his head somewhat higher than he did before. But the older members of our fraternity, some of whom must have minds fashioned on the encyclopædia principle, or heads divided up into innumerable pigeon holes in which they sort all manner of useful facts, smile to themselves when they remember that many years ago the same invention was brought before one of the two or three photographic societies then existing, and after being discussed in the usual manner, found its level and sank into oblivion.

It is no fault of the recent amateur that in his zeal he should fancy that he has discovered something new, and should seek to let others have the benefit of it, and we should be the last to check such praiseworthy conduct. Such a check, indeed, would have a disastrous effect in perhaps deterring some modest worker from publishing a really valuable observation in case it should be afterwards found that he had been forestalled by someone else. Still, we think that the photographic press should, when a claim is made to something new, which they know to be very old, point out the real facts. Instead of this, it sometimes happens that through ignorance or design, the matter in question is made the subject of paragraphs and articles, and the name of the reintroducer of the matter is regarded as the author of its being.

A case in point has recently occurred in New York, where Dr. J. J. Higgins is credited with having introduced a new system by which gelatine plates may be developed under a bright and naked gaslight, or even by daylight. This worthy doctor has certainly come as a boon to the American photographic press, which has "boomed" his discovery in that thorough manner in which the transatlantic journalist excels. He is described as a great reformer who has arisen to save his fellow-photographers from losing their eyesight by working in a dull light. The red lamp of the dark-room is henceforward to be abolished, except for the mere changing of plates. "Exposed plates can be handled almost recklessly, and the development of them made a luxury instead of the great trial it is to those who must develop their plates after the hard work of the day." These words are quoted from a leading photographic publication.

But what is this wonderful discovery which is to make such a revolution in the practice of our art? Is the white

flame of the gaslight to be made non-actinic by the magic aid of chemistry, and yet retain its whiteness, or are the plates to be treated in some manner which will render them insensible to its action? The latter is the course pursued by Dr. J. J. Higgins. To make a long story short, he simply places the exposed plate in a sufficiently deep dish containing the old ferrous-oxalate developer, which is a ruby-red liquid, and he then turns up the gas over the dish and watches the development at leisure.

We suppose that Dr. J. J. Higgins, and the gentlemen of the Press who have so boomed his discovery would be rather surprised to hear that about twelve years ago a little book was written by Mr. John Burgess, one of the first workers of gelatine emulsion processes, in which he described "a new method of development." It was precisely the same as that which has now been republished with such a fanfare in New York, only it happened to be original, and moreover it had some novel points about it which Dr. Higgins has altogether missed.

Mr. Burgess's method was to fill a deep dish with the ruddy iron developer, and upon it to pour an ounce or two of paraffin oil. The exposed plate was first soaked in water to render it repellent of the oil, just as a lithographer will sponge over his stone to attain the same end, and was then placed in the dish and taken out into the light. The gradual development of the image could then be watched in comfort, and the plate was afterwards washed and fixed in the usual way. The object of the paraffin was to keep the developer from the action of the air, so that it did not rapidly deteriorate and become inert.

We all know that this method of development was allowed to become obsolete, because pyro and other agents were found to give the worker far more control over his plates. Its revival as something new is amusing to those who are not raw recruits in the photographic army, and as to the advantage of carrying the dish into white light, we may point out that by the single expedient of covering the dish with a pane of ruby glass, no matter what developer we use, it can be moved about with impunity. For our part we prefer to keep our plate during development in its proper place, the dark-room.

Letters to the Editors.

A VISIT TO NORWAY.

SIRS,—It was my privilege and pleasure to be present on the evening of Friday, 24th instant, in the Birkenhead Town Hall, at a lime-light demonstration and lecture on Norway, given by Mr. Paul Lange, the President of the Liverpool Amateur Photographic Association.

I have never been in a more comfortable or better arranged building, replete with every modern convenience. Every seat was occupied. The body of the hall was reserved mainly for those in evening dress, which, with the gallery, made up an audience of about 800. In fact, the sale of tickets was suspended on the previous day.

Now for the lecture (which was preceded by an excellent miscellaneous concert). The subject was "Norway—a Tour in June last," when the lecturer and three Liverpool companions enjoyed a charming holiday in that portion of Norway embraced in the Hardanger Fjord, Lognefjord, Nordfjord. I have made it my special business to obtain for your readers the full particulars of the plates, etc., used, viz.:

The camera, a 5 by 4 hand-camera, also available with the tripod; lens, Ross, half-plate; shutter, double curtain, the "Paul Lange" adaptation; the plates, ordinary Ilford; developer, pyro and soda. The positive transparencies, all on Mawson and Swan's (except five cloud studies, on Alpha), hydroquinone deve-

oper. Nearly all the slides were produced in the copying camera, by daylight.

The 134 views which were projected on the screen (16 ft.) embraced remarkably fine and picturesque waterfalls, glaciers, street views in Bergen, the fish market and street life, and interiors, closing with a splendid sunset view.

The lecture was most instructive, the frequent expressions of approval and delight of the audience bearing testimony to that effect. It may interest your readers to know something of the cost of such an excursion for twenty-seven days. From starting to final return home it was £24 10s., with capital hotels, good cooking, and liberal bill of fare; the route, Liverpool to Newcastle-on-Tyne, and thence by an East Coast steamer to Bergen. Mr. Lange dwelt strongly on the advantage of at once breaking off the coast line of steamers, using the smaller branch or native steamers, thus enjoying the less frequented routes and seeing more fully the interior of the country. The lantern used was Messrs. Archer and Son's biunial, placed on the gallery, 70 feet distant from the screen, double pressure. The curtain effect lent itself specially well with the cloud studies. Everything went off without a hitch on the part of the lantern.

I see you called attention in yours of the 24th, to the fact that thirty out of thirty-eight of the popular lectures to the people to be delivered in the Rotunda Hall, Liverpool, are to be given with the aid of the optical lantern. This fact is exceedingly gratifying to the photographic circle here, which you know embraces many ardent and active workers. I conclude with an extract of a hearty letter received to-day by Mr. Lange, which he sent me to read: "We must compliment you on the evenness of tone secured, and at the same time, and in a word, upon the great success attending your efforts to popularise and raise the tone (no pun intended) of lantern work throughout the provinces."

This testimony is from Messrs. G. W. Wilson and Co., Aberdeen, to my mind the producers of the finest and best lantern slides in the world.—Yours, etc.,

AN ONLOOKER.

* * * *

PHOTOGRAPHIC SOCIETY FOR CROYDON.

SIRS,—Referring to Mr. Maclean's letter in your last issue, and your remarks thereon, will you allow me to state that the photographic section of this club fulfils all the functions of a local photographic society? The section has been established for some years, and we have tried very hard to improve the status of photography in Croydon. During the past year we have had papers and demonstrations from some of our best known photographers. I may mention amongst others the names of Mr. Andrew Pringle, Mr. George Davison, and Mr. William Brooks of Reigate, one of our own members. We have had monthly lantern evenings in addition to our ordinary meeting nights, country excursions with the camera throughout the summer, and, in short, done all that could be done to help photography in this neighbourhood. While sympathising entirely with the object Mr. Maclean has in view, I cannot but think that the establishment of another photographic society in Croydon would, by dividing interest in the matter, prove a source of weakness rather than of strength to local photography.—I am, etc.,

CHARLES HUSSEY

(Hon. Sec., Croydon Micros. and Nat. Hist. Club,
January 27th, 1890. Photographic Section).

SIRS,—A very natural letter of protest from the Secretary of the Photographic Section of the local Microscopic and Natural History Society, directed against the photographic society I am trying to organise, has appeared in one of the local papers. In case the gentleman has written to you in the same strain, I send you a few lines on the subject.

The "section" above referred to is very limited in its numbers, and the work done by its members is not of a high average of excellence. It can, by no stretch of imagination, be considered to represent above a *tenth* of the Croydon workers in photography. But if it were the success which it is not, I would still advocate the formation of an independent society, one *free to work out its own destiny*, and one whose whole and undivided allegiance should be given to photography.

Besides letters of support from various quarters, one gentleman has placed at the society's disposal "a good double lantern with steel gas cylinders."

My object in writing this is to keep you informed on the subject. I hope you will be able to insert a short "par," and urge

upon procrastinators to send in their names in "double quick time." One name this week is worth ten a month hence.—I remain, yours truly,
HECTOR MACLEAN,
January 27th, 1890.

* * * *

CAMERA CLUB CONFERENCE.

SIRS,—I am requested by my Committee to ask your assistance in announcing the following outline of the Camera Club Conference for 1890.

The 1890 Conference will be held in the theatre of the Society of Arts (by kind permission of the Council) on Thursday and Friday, March 20th and 21st, under the presidency of Capt. W. de W. Abney, C.B., R.E., D.C.L., F.R.S.

On Wednesday, March 19th, at 8.30 p.m., there will be a special smoking concert at the Club-rooms, and the members' annual exhibition of pictures will be opened.

On Thursday, March 20th, at 2 p.m., the President will open the Conference and exhibition of apparatus at the Society of Arts, and papers will be read from 2 to 5.30 p.m. In the evening a lantern-slide exhibition will be given in the theatre of the Society of Arts, for which special tickets may be obtained.

On Friday, March 21st, the apparatus will be shown from 10 a.m., and at 2 p.m. the Conference will be renewed. At 7.30 the annual dinner for members and friends will take place.

A complete programme will be issued later and distributed. All photographers will be cordially invited to the Conference.—I am, yours faithfully,
GEORGE DAVISON,
January 27th, 1890. Hon. Sec.

* * * *

THREE MONTHS IN THE MEDITERRANEAN.

SIRS,—I am shortly taking a month's trip in the Mediterranean, and therefore beg you will be kind enough to advise me as to my outfit.

I shall take a Watson's Acme whole-plate camera, three slides, and Eastman's roll-holder and new films. Do you think these films are affected by sea air, supposing I keep the roll-holder always in a mackintosh case when not actually using it? What plates would you advise me to take—fast, medium, or slow? For lenses, I have a Beck 11-in. rapid rectilinear, and a 9-in. ditto; but I think I want a shorter focus wide-angle for buildings, etc. Will you kindly advise me? I also thought of buying a hand-camera. Do you think Fallowfield's Facile worth buying for the purpose? It seems to me to be simple, and there is no bother about opening slides, etc., before one makes an exposure, which appears to me an advantage.

I shall probably go by P. and O. steamer to Naples or Brindisi, thence to Corfu and Constantinople. Ought I to take developing materials with me? If I do, I fear I shall find them a great nuisance and incumbrance. With many thanks in anticipation, and apologies, I am, etc.,
R. T. Y. C.

NOTE.—We publish this letter, as many of our readers who have been over the same ground may be able to give help to our correspondent, practically advise, and answer his queries.

* * * *

COPYING.

SIRS,—As with your usual forethought you have published a letter from Mr. J. H. Montagu relating to a branch of photography especially practised at this season of the year, perhaps you will allow me to make a few remarks touching his letter and other points which appear to me to be notable concerning the *modus operandi*. In the first place, when, as is frequently the case, the amateur has no glass house or proper studio to which he can resort, copying is best done in the open air, and not in an ordinary room, as your correspondent advises. I defy any one to produce such good results within the house as are obtainable out of doors, and I was prompted to write these few lines to warn the "countless flock" from following Mr. Montagu's suggestion. Waste of time, plates, and labour will necessarily ensue, and, worst of all, that bitter disappointment which has caused so many to say that copying is beyond the reach of amateurs. Of course, we all know that it is not an easy matter, but practice and patience alone are required when once the right track is hit on. I have found that the best light for copying is that on the shady side of a house on a fine day. Sun must be avoided, while bright clouds are advantageous, inasmuch as they reflect the light down upon the picture to be copied, in the same way as a sheet reflects the light up to the face of the sitter. In the absence of clouds it

is permissible to tilt your picture, if it has an engraving surface; this cannot be done if it has a glazed surface.

Secondly, what does Mr. Montagu mean by the advice, "Put a small amount of bromide in the developer to make the items of the picture more distinct and separate"? I quote from Mr. W. K. Burton's "Modern Photography":—"The result of increasing the bromide is to make the developer much slower, to keep back detail, and to increase ultimate density greatly."

I really can scarcely recommend any novice to follow these two pieces of advice given by one who seems to start new theories of his own quite at variance with those advanced by better known and probably more experienced workers.—Faithfully yours,

Jan. 27th, 1890.

RADIATION.

* * * *

GLAZED PRINTS.

SIRS,—I shall esteem it a great favour if you will kindly permit me, through your columns, to thank Mr. C. Hetton Lewis for his trouble in answering my query respecting glazed surface prints, especially as he has gone so minutely into every detail, and I venture to think that it will now be nearly impossible for others, as well as myself, to go far wrong in the experiment. I should also like to thank Mr. F. J. Thornton for his information on the subject, but I must say I have never used negative glasses for the purpose; perhaps it was in that point I failed. But I do not suppose there would be much difference between a clean negative glass and a piece of clean plate-glass, which I have always used.—I remain, Sirs, yours truly,

January 27th, 1890.

W. E. BEX.

* * * *

PHOTOGRAPHY AT BOULOGNE.

SIRS,—I am glad to hear that Mr. Edward Jackson found every facility given to him to photograph the interior of the cathedral at Boulogne. In 1886, when I was there, the Director asked me to pay sixty francs for this privilege. As this extortionate demand is apparently abolished, it shows how a little pressure in the Press assists the amateur photographer, because I sent a copy of your issue of June 25th, 1886, containing my original letter, and your editorial remarks on it, both to the Director at Boulogne and to his immediate superior, the Archbishop at Paris, with a couple of post-cards containing the most sarcastic remarks my knowledge of the French language enabled me to make. Possibly these communications resulted in a change of the directorate of the Cathedral, as M. Libtoin, the present director, was not there in 1886.—Yours faithfully,

January 25th, 1890.

GEO. H. VERNEY (Lt.-Col.)

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

WEIGHTS AND MEASURES.

(Continued from page 40.)

THE METRIC SYSTEM derives its name from the *metre* (Gk., *metron*, a measure), which is the unit of length. It is also often called the French system, from the land of its origin. It was intended to be based on a natural unit, and the metre was intended to be one-ten-millionth part of the distance along the surface of the earth from the equator to the pole. An error was however made in the determination, and the actual metre is just as much an arbitrary standard as our own yard. It was defined by a law of the French Republic in 1795 as the distance between the ends of a certain rod of platinum made by Borda, and the actual distance is rather more than an English yard. The value and advantage of the metric system does not depend on the magnitude of the fundamental unit, but on the fact that there is a simple relation between the measures of length, capacity, and weight, and that it is a decimal system, all the sub-multiples and multiples being powers of ten.

The metre is divided into 10 equal parts, termed *decimetres*

(dm.); each of these is divided into 10 equal parts, termed *centimetres* (cm.); and each of these into 10 equal parts termed *millimetres* (mm.).

1 metre = 10 decimetres = 100 centimetres = 1,000 milli-

metres.

1 decimetre = 10 " = 100 "
1 centimetre = 10 "

The decimetre is rarely used, and the only multiple of the metre which is used in practice is the *kilometre* (km.), which is equal to 1,000 metres. As a matter of fact, each multiple or sub-multiple is used as a sub-unit according to the magnitude which is being dealt with. Minute distances are expressed in millimetres and decimal parts thereof; small distances such as we deal with in the laboratory are expressed in centimetres; and long distances in metres or kilometres.

Areas are measured in square millimetres (sq. mm.); square centimetres (sq. cm.) or square metres (sq. m.).

Volumes, if small, are measured in cubic centimetres (c.c.) and fractions thereof. For general purposes a special unit of volume termed the *litre* is employed; it is a cubic decimetre or 1,000 cubic centimetres. Any incomplete part of a litre is expressed as a decimal. For example, 1,200 c.c. would be spoken of as twelve hundred cubic centimetres or 1.200 litres. Any volume expressed in cubic centimetres can at once be converted into litres by moving the decimal point three places to the left (*i.e.*, dividing by 1,000), and *vice versa*. Very large volumes are expressed in cubic metres.

The *unit of weight*, called the *gramme*,* has a simple and definite relation to the units of length and volume; it is the weight of one cubic centimetre of water at 4 degs. centigrade and in the latitude of Paris. It is necessary to specify the temperature, because, as will be explained more fully subsequently, the bulk of a given mass of water varies with the temperature; and also to specify the latitude in which the water is weighed, because, as already stated, the weight of a given mass of any substance depends on its distance from the earth's centre. The *gramme* is divided into tenths (*decigrammes* = dgm.), hundredths (*centigrammes* = cgm.) and thousandths (*milligrammes* = mgm.). The only multiple in practical use is the *kilogramme* (kilo., or kgm.)—which is equal to 1,000 grammes, and is used for weighing large quantities—and the *metric ton*, which is equal to 1,000 kilos.

Just as in the case of measures of length, the sub-multiples are used as sub-units. The quantity 2.437 grammes is not spoken or thought of as two grammes, four decigrammes, three centigrammes, and seven milligrammes, but as two *point* (or *decimal*) four-three-seven grammes. In fact, the only use of separate names for the sub-multiples and multiples is that it enables them to be used as units in dealing with small or large quantities; thus, we speak of five *point* (or *decimal*) two-four milligrammes (5.24 mgms.) more conveniently than of 0.00524 gramme, and of twenty-six *point* (or *decimal*) eight-one kilos, more conveniently than of 26.810 grammes.

It has been pointed out previously that the English and the metric system are quite independent, that the use of one of them does not involve or require a knowledge of its exact relation to the other, and that what the student has to do is to select one and keep to it. The metric system offers considerable advantages over our English system, and it is in almost universal use for scientific purposes.

Sometimes it is useful to know the relation between quantities in the two systems, and the following numbers

* Very frequently spelled gram, but as this is very liable to be misprinted or mis-read as grain, I prefer the original spelling.

will enable this to be ascertained in all cases with very little calculation :

1 metre	= 39.37 inches.
1 litre	= 1.76 pint.
1 gramme	= 15.4323 grains.
1 kilo	= 2.205 pounds avdp.
1 inch	= 2.54 centimetres.
1 fluid ounce	= 28.35 cubic centimetres.
1 ounce avdp.	= 28.35 grammes.
1 ounce troy	= 31.10 „
1 pound avdp.	= 453.6 „

Weighing must be performed with care if accurate results are desired. A good pair of apothecaries' scales, preferably with glass pans, will answer for all purposes except quantitative analysis or research. It consists of a beam which turns on a wedge-like support (known as a *knife-edge*) at its centre. The pans are suspended by cords or wires connected to a hook which hangs in a hole or hook at the end of the beam. (A, fig. 7.) The beam must be of exactly the same length and weight on either side of the point of support, and care must be taken that the hooks carrying the pans hang freely from the proper points at the ends of the beam. A pointer attached at right angles to the centre of the beam shows when the beam is horizontal, or, in other words, when the weights in the two pans are

FIG. 7.

equal. Better results are however obtained by allowing the balance to swing gently, and observing the distance beyond the centre to which the pointer moves on either side. When the pointer travels exactly the same distance from the centre on both sides, the weights in the pans are equal.

Accurate balances are of somewhat different construction. The knife-edge at the centre of the beam rests on a plane surface at the top of a firm pillar, and at each end of the beam is a reversed knife-edge on which rests the hook or attachment carrying the pan. (B, fig. 7.) Usually there is an arrangement for lifting the pans off the beam and the beam off the central support when a weighing is not being made.

Observe carefully the following *rules of weight* : (1) Carefully protect the scales or balance from splashes of liquid and from fumes of all kinds. (2) Take equal care of the weights, and handle them with a small pair of forceps (usually supplied with the set) in preference to touching them with the fingers.* (3) Never put on the pan of the scales any vessel or article which is wet on the outside. (4) Never put any substance into the pan without putting a piece of paper or a watch glass or small dish on the pan first, unless the pans are of glass. The paper, watch glass, etc., must, of course, be counterpoised by weights or very small shot before making the weighing. (5) Before putting anything on or taking anything off the pans, always rest them on the table, or in the case of more accurate instru-

ments raise the beam, etc., off the knife edges. (6) Avoid, in general, any jerks or other rapid movements which would injure the balance by disarranging the supports and otherwise throwing it out of adjustment.

Winter Work.—XVII.

By T. C. HEPPWORTH, F.C.S.

ON FASHION IN FRAMES.

THERE has been somewhat of a revolution in the matter of picture frames during the past few years, and, as a rule, the elaborate frames of past days are giving place to those of a far more simple and less ornate character. In our permanent

picture galleries we can still see the scalloped gilt monstrosities which our forefathers considered necessary to set off their pictures. But in a modern gallery we see few of these old-time frames, for they have been superseded by those of newer fashion. It must be admitted that some of these are so simple in character that they border on the eccentric.

For instance, that wayward genius, Van Beers, who has during the past few years had an annual exhibition of his own works, seems to despise the ordinary gilt frame entirely, and prefers to use a frame made of wood stretched over with coarse canvas and painted with green distemper. Many of his pictures I have seen thus framed, some measuring something less than a photographic quarter-plate being furnished with a frame quite nine inches in width. This arrangement certainly has the advantage of preventing the works being crowded, or injured in effect by juxtaposition, but it is extremely eccentric.

But Van Beers is not the only painter who rejoices in queer-looking frames. Mr. Whistler treats his pictures in much the same way, and evidently with the intention that the spectator's eye should not be enticed away from the principal object.

This is all very well, but the idea may be carried too far, and is carried too far, especially by those of our younger artists who are trying to found a new school of painting. The eccentricity of their pictures is often only exceeded by the peculiarity of the frames in which they are set. In portraits of eminent men it would always be well if the frame could be made consonant in

(1.)

(2.)

(3.)

* This is imperative in the case of accurate sets of weights.

some way with incidents of their lives, studies, or with their works. Thus a portrait of Sir Isaac Newton might be framed in carved wood, depicting some of the apparatus used in his researches, just as in the case of the portrait of another famous Izaak—the father of anglers—which is hung at Brasenose College, the frame is adorned with rod and tackle and other mysteries of the fisherman's stock-in-trade. In a recent exhibition in London I noted with pleasure that an Egyptian subject was framed very happily in gilded wood, upon which were carved representations of hieroglyphics, whilst the two uprights on either side were columns modelled from those of Egyptian rock-cut temples. This plan of framing a picture with regard to its subject is much to be commended. But we must remember that the large majority of persons whose portraits are painted or photographed lead humdrum, colourless lives, and it would tax the ingenuity to its utmost to frame them in a distinctive manner. For ladies' portraits I have lately noticed the introduction of a type of frame which is very effective, and which I fancy is of French origin. It consists of a simple

(5.)

flat, covered with canvas of very open texture, which is glued to the wood and then gilded or silvered. Upon this flat, which has the general appearance of frosted metal, is attached at one corner a sprig of some flower, also in gold or red bronze. This ornament has the charm of carelessness, and is most effective. The same frames, too, instead of being covered with canvas, may be glued and sprinkled

with rice, or any kind of grain, being afterwards silvered or gilt. Gilded oak frames of various designs have also come lately into fashion, and if the wood be of handsome figure—by which I mean beautiful grain—and this grain be allowed to show well through the gold, the effect is as fine as can be desired. This is, moreover, a kind of frame that is well calculated to show off a photograph. Many amateurs who have tried any form of gilding have been tempted to give it up in despair. This arises principally from the circumstance that the gold-leaf used is so extremely thin and light that it is the sport of every breath of air, and it invariably shows a disposition to cling to everything except the precise spot for which it is intended. Like most other delicate operations, this one of gilding requires an apprenticeship before it can be practised with any perfection, and it is very doubtful whether an amateur worker, however skilled, will ever be able to master, without this apprenticeship, the art of matt gilding and burnishing. Under these circumstances, it would seem to be futile to recommend an amateur to attempt to gild his frames, and it would be so were ornate mouldings with burnished lines and projections under consideration. But the matter of gilding an oak flat or rounded moulding is comparatively

(4.)

—one forming a kind of inner slip to the other. Fig. 2 is of ribbed dark or stained wood, with a gold slip next the picture. Fig. 3 is a moulded oak frame, gilded so that the grain or figure of the wood shows up clearly through the gold, and catches the light in a very pleasing manner. I may mention that such moulded wood is sold at many sawmills, for decorative purposes, and by a little building up at the back may be rendered serviceable for picture frames. Fig. 4 is more elaborate, because it has a carved border, but the major part of the frame is flat oak gilded. No. 5 is a bevelled frame, the bevel running in two different directions, as may be seen by reference to the sectional diagram. Such a frame can be made of various materials, so as to suit the picture or the wall upon which it has to be hung. This latter point, although a minor one, is of some importance. Plain oak looks well almost on any wall, for it is neither very light nor very dark in tone. Ebony frames look well on dark walls, but afford a violent and unpleasant contrast to a light one.

Fig. 6 has a more elaborate appearance than the frames already noticed, because of the pattern carved upon it. The frame can be made of oak, and the pattern marked upon it by means of a stencil; the marked portions being afterwards cut out with a carving tool—no very difficult matter. The frame from which I copied this pattern was gilded oak, and was in keeping with the subject of the picture which it held—the courtyard of a stately old building. No. 7 is also a gilded oak frame, with a kind of raised wavy bead upon it, which forms a loop at each corner.

(6.)

(7.)

simple, and well within his powers. The operation has, moreover, been simplified by the introduction of the transfer process, by which the gold leaf is kept well in hand, and unable to stray away during the progress of the work. This transfer gold is sold in leaves, which are attached to waxed paper, an attachment which is finally overcome by the greater tenacity of the medium employed to stick the metal to its final support.

I will now briefly describe each pattern of frame which is here illustrated.

Fig. 1 consists of two flats of dead gold —one forming a kind of inner slip to the other. Fig. 2 is of ribbed dark or stained wood, with a gold slip next the picture. Fig. 3 is a moulded oak frame, gilded so that the grain or figure of the wood shows up clearly through the gold, and catches the light in a very pleasing manner. I may mention that such moulded wood is sold at many sawmills, for decorative purposes, and by a little building up at the back may be rendered serviceable for picture frames. Fig. 4 is more elaborate, because it has a carved border, but the major part of the frame is flat oak gilded. No. 5 is a bevelled frame, the bevel running in two different directions, as may be seen by reference to the sectional diagram. Such a frame can be made of various materials, so as to suit the picture or the wall upon which it has to be hung. This latter point, although a minor one, is of some importance. Plain oak looks well almost on any wall, for it is neither very light nor very dark in tone. Ebony frames look well on dark walls, but afford a violent and unpleasant contrast to a light one.

“TYLAR'S ANNUAL AND PRACTICAL HINTS” has just come to hand, and it is a very useful, handy, and tastefully got up publication. The reproductions of pictures by well-known amateurs are fair, but the hints on general manipulations are eminently practical. The book is also a catalogue of every piece of apparatus that the photographer, professional or amateur, can desire, and we must congratulate Mr. Tylar on the fact that he distributed 20,000 copies of the “Practical Hints” during the past year.

“THE Photographer's Diary and Desk Book for 1890” is a very useful publication, and will no doubt meet with a large sale among amateurs who care to make a daily record of their doings. There is included in the volume a very good epitome of recent apparatus and formulae, together with much information the progressive photographer will be glad to assimilate.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

APPARATUS.

(Continued from page 42.)

Tripod-heads.—For some reasons best known to themselves, manufacturers persist in making tripod-heads much too small. When this defect is excessive the article should be decidedly rejected. The base-board of the largest-sized camera for which it is intended should be the guide for the proper dimensions of the tripod-head. It should also be attached to the legs by some method that does not necessitate projecting clamps. Some otherwise well made tripods have these easily-to-be-dispensed-with pieces of ironmongery, which not only make the tripod head a clumsy affair, but when it is packed with the camera and dark slides these projections are frequently the source of the damage the apparatus sustains when travelling.

The latest and most improved forms of camera are made so that a tripod head is not required. Its duty is fulfilled by a turntable being inserted in the base-board of the camera itself, to which the legs of the tripod are clamped direct. This form of camera is a most convenient one, and reduces by two the number of different articles constituting the *impedimenta* of a photographer, for the attaching screw is also dispensed with. One drawback these turntables possess when not well made; in damp or hot climates the wood is liable to swell or the metal to expand, so that it sticks, and by refusing to revolve becomes troublesome. A camera of this form should therefore be examined, and any liability to this defect that may be apparent should be remedied.

The thumb-screws required to attach ordinary cameras to the tripod should also be larger in diameter than those generally employed. This screw may conveniently be attached by a string to the tripod head, but it should not be a fixture in the screw hole, for it is then a projection, and the same remarks apply as before made respecting the leg attachments.

On some occasions where the use of a tripod is out of the question a photographer can employ in a similar capacity a small clamp which is sold for the purpose. This ingenious piece of apparatus can be fastened to a tree, gate, or boat's gunwale, and when the camera is attached to it, will permit, by a ball-and-socket arrangement, of all the necessary movements being made when focussing.

Hints Concerning Tripods.—The legs of a tripod are generally shod with iron spikes, which are useful arrangements for all out-of-door work, but are a drawback when it is being employed in an interior, for if the flooring is of hard wood or stone a ready purchase cannot easily be obtained. Under these circumstances pieces of cork, wood or some cloth fastened to the sharp points will prevent to some extent the tripod evincing a tendency to slide about.

Dark Slides, or "Backs," as they are frequently called, are the cases made to carry the sensitive plates in such a manner that when the slides are placed in the camera, in the position ordinarily occupied by the focussing screen, a plate can be exposed without any light other than that entering through the lens affecting it.

There are several varieties of these dark slides, but, under ordinary circumstances, the purchaser of photographic appliances had better buy as many as he requires of the pattern the maker of the camera recommends as suitable for his patent. As these contrivances are generally made to hold two plates each, they are often called, in consequence, "double backs." The plates are brought into

register alternately by the simple process of reversing the back. Since the use of "dry plates" has superseded the employment of "wet collodion" ones, single backs are rarely used, except, perhaps, for studio work. The style of "double back" that seems to be the most popular is the one known as the book form.

Whatever pattern is chosen, the following features should be considered as essentials. The "back" should exclude light at all points, for the very faintest ray penetrating therein will mar the photographer's work, and even if he takes care to always keep his double backs well covered up, a weak spot therein becomes the source of constant anxiety at a time when his mind should be perfectly free from any such feeling.

There are three weak parts in these double backs. The first is in the hinged opening or division between the two halves, which permits of any warping or drying up of the wood to cause a slight aperture through loss of absolute contact between the parts. This undesirable feature of these contrivances for holding extremely sensitive materials has caused some manufacturers to make these double-backs in one solid piece, the plates being either slid into position through grooved openings in one end thereof, or "buttoned" into place when the shutter is withdrawn. Weak places exist in the manifold hinges some makers adopt for enabling the shutter when drawn out to be folded back out of the way, which is a very desirable convenience for the shutter to possess, but, nevertheless, is not one worth procuring by any destruction of its light-excluding capabilities. It is quite possible, however, by a proper system of grooving, or by means of a suitable backing, to make these hinged shutters quite light-tight. A thorough testing is the only way, however, of finding out whether they are reliable; and to learn their merits in that direction, it is worth while sacrificing a few plates. Fill the double backs in the dark room with sensitive plates of the full size, and subsequently leave them out in a bright light for a short time, or even in sunlight for some minutes. Afterwards in the developing room treat the plates as though they had been exposed. If light gets in, the place will be shown by black marks becoming visible, or in very bad cases by fog appearing all over them, but of greater density where the weakest spot exists in the double back. If the slide keeps out light the developer will fail to exert any influence on the plate.

Another weak spot in these double backs exists in the opening through which the shutter or slide is drawn out. The fog produced through defect in this arrangement, by allowing the light to glance along the surface of the plate, is of such a peculiar character that once it has been seen, it can always afterwards be immediately recognised. Some shutters are made to draw completely out, and the aperture through which they pass closes with a spring. If carefully manipulated, they appear to work well, but there always exists the risk of some dust or a fine splinter catching in the opening and preventing it completely closing. Again the shutter becomes a loose piece, and under some circumstances can in consequence become a bother. If made of vulcanite or any fragile material, it suffers the increased risk of being broken by an accident or through the wind catching it and causing it to fall. The folding shutter when thoroughly well made is probably the best, and is a favourite in England, but in America the solid shutter is preferred.

Dark backs, made of metal, have been introduced by Mr. Tylar, of Birmingham, and some advantages are claimed for them over wood. They are more compact, in consequence of their being made thinner than wood will permit with safety, and they are perfectly light-tight, for the grooving in which the shutter slides are made much deeper than in the ordinary double back. Certainly they are much

more durable, for the weather or rough usage will not affect them to the same extent; but the advantage is not all on the side of metal in the matter of weight, nor in other respects in some minor conveniences. The exposing slide being solid, when it does not draw completely out it juts beyond the camera in a most awkward way, which is especially inconvenient when the picture is being taken horizontally. This feature keeps the cloth away from the camera at the very time its protection is required, and as it is liable to catch the wind will frequently become the source of vibration. The form of metal slide in which the shutter is not a fixture therein is the one, therefore, which is to be preferred, always presuming that it is equally light-tight.

Feather-weights.—Some very light forms of "double backs" are made in the United States to which this name has been given. They are very similar in shape to some English dark-slides but the material employed in their construction is different, cardboard being in some places substituted for wood, and the wood used is of the very lightest character. They are consequently nothing like as heavy as mahogany-made backs, but being of such a fragile nature that they require excessive care in handling, these "feather-weights" are not liked on this side of the Atlantic. One contrivance some of the slides possess is worth mentioning. After the shutter has been completely drawn out to make an exposure, it can be reversed before being returned, and as both sides are differently coloured, there exists a sure guide for the prevention of any double exposure. In others the back of the shutter is roughened so that it can be written on, and by this means a record can easily be made of all the required details concerning the exposure.

All dark-slides should be numbered consecutively and very distinctly, so that the number of the plate exposed can quickly be discerned for recording purposes.

The catch that prevents the shutter from being accidentally drawn out should be of a very efficient character; the ordinary bent wire arrangement is certainly not to be recommended. Some ingenious and simple springs are now made, and they should be applied to all dark-slides, for a badly secured shutter is very liable to be the cause of annoyance at some time or other.

(To be continued.)

Our Contemporaries at Home and Abroad.

THE *American Lithographer and Printer*, speaking of photo-mechanical processes, says, "One of the most workable of the processes is the last named, 'collo type,' and the results obtained by it are almost equal to, and more suitable for, illustrative purposes, than sun-prints from the original negative, while it allows of copies being struck off at the rate of from six to eight hundred an hour, on steam presses very similar in appearance and construction to those used for ordinary lithographic work."

The *British Journal of Photography*, in an article on "Patents and Trade Marks," speaking of the law on the subject, says, "We say 'moderately reliable,' for, alas! the law, in its practice, is far from being an exact science, whatever it may be in theory, and one judge does not always agree with another, even when a case has been argued before both." Another article on "Acid Solutions of Hypo," referring to the sulphur toning process, says, "We are convinced that a thorough investigation of the subject, even at this day, when processes of known absolute permanency exist, would be fruitful in valuable practical results. . . It is evident from the quotations we make that we are still far from being able to form a true working hypothesis regarding the old sulphur toning." Articles: "The New Rollable Film of the Eastman Co.," "Odd Jobs," "The New Benzoline Limelight (iii.)," "Photographic Pleasures" by the late Cuthbert Bede,

"Illumination of Negatives for Transparency Printing by Artificial Light (ii.)," etc.

The *Journal of the Photographic Society of Great Britain* contains papers on "The Control in the Density of Negatives;" "The Distance beyond which all Objects will be in Focus with any given Lens," giving a useful table; "Eikonogen as a Developer in Practice," by Mr. W. K. Burton, in which he says, "After all, I have not answered, even to myself, the question that I started with, namely, shall I prefer eikonogen to pyro for general work? It will be seen that I consider that the claims that have been put forward in its favour are extravagant. On the other hand, it has certain advantages. One of these is its extreme cleanliness. This will probably have more weight with most people than with myself. Then it is hard to part with old friends that you do, or at least fondly believe that you do, quite thoroughly understand," etc.

The *Journal of the Photographic Society of India* (Calcutta), a very interesting publication, is accompanied this month by a reproduction of a picture of the Burning Ghat, Benares, and contains an excellent paper on "The Indian Amateur Photographer, another "With the Sushai Field Force," and also an exhaustive article on "The Recent Photographic Exhibition at Calcutta."

The *Journal of the Society of Arts* contains a most instructive paper by Mr. R. Brudenell Carter, on "Practical Vision Testing," which will be found of some interest to photographers.

The *Photographic News* (Japan) is no doubt a most interesting publication, but as we are unable to read the peculiarly graphic characters of the language, we cannot express a decided opinion on the point, but must assume the fact in consequence of Mr. Burton's connection with it. There is, however, one thing we can see and understand, viz., that it contains two prints, illustrating untouched and retouched negatives, the exact copies of two which were given in 1875, in "Vogel's Chemistry of Light and Photography." We should have thought that in a country so go-ahead as Japan, the Editor could have managed to secure some more recent pictures illustrative of the point.

The *Photographic News* devotes its first article to "Purpose in Photographic Work," and gives some very good advice on the point. It says that the man who studies the history of his locality soon finds a purpose, and "such relics of the past as modern improvements have not yet removed he will photograph ere it is too late, and feeling the absurdity of trying to render his pictorial records more permanent by means of albumenised paper prints than the original objects themselves, he will plunge into higher branches of photography, such as relate to ceramic, platinotype, and carbon pictures, thereby doing service to the public, and building for himself a lasting reputation." Articles: "Wedgwood," "The Best Photographer," "Photography in Germany," "Eikonogen," "The Late Cuthbert Bede," "The Daguerre Monument at Washington," etc.

The *Photographic Times* (New York), in its editorial notes, says, "Traddell and Young have determined, after a series of carefully made experiments, that eikonogen is not suited for making ten per cent. solutions, on account of its limited solubility. They claim that the finest details and best printing density are obtained with this developer when made after the following formula:—(A) Eikonogen, 1 oz.; crystallised sulphite of sodium, 4 ozs.; distilled water, 3 qrts. (B) Crystallised carbonate of sodium, 1 oz.; water, 3 qrts. Equal volumes of A and B are used for correct exposures; and proper modifications are made by increasing or diminishing one solution or the other, as in the case of the alkaline pyro developer. For instantaneous work they recommend increasing the strength of the developer by reducing the quantity of water." Articles: "Pyro Solutions," "Photographing Wild Buffaloes on our Western Plains," "Deterioration of Ultra-Sensitive Gelatine Films," "New Photographic Developers," etc.

Photography, speaking on the subject of "The Separation of Amateur and Professional Work," says, "We are not going to declare it bad absolutely, but certainly it cannot claim to have accomplished any great things so far. It advances neither the artistic nor the scientific side of photography, and beyond enabling very mediocre work to win prizes at exhibitions does not appear to us to serve any good purpose." On "Retouching," it says, "It is impossible to define exactly the scope of legitimate work upon the negative, but if universal respect could be got for the principle that retouching ought to be confined to the getting

rid of accidental faults and the few defects inherent in photographic processes, so far as these can be modified without interfering with the integrity of the production as a photograph, there would be no need of definitions." Articles: Gelatine Plates for Photo-Mechanical Line Work, etc.

The *St. Louis and Canadian Photographer*, in a letter from A. Bogardus, says, "It is the duty of the skilled operator to pose all these faces to the best advantage. But the camera will not discriminate. All these peculiarities which they wish to avoid will show. And as it is the truth, why should they not show? If the mother has small eyes, shall her picture show large ones, or if her eyes are large shall her descendants see her with small ones? It is a question of truth or of falsehood. Just as well paint her hair a fashionable colour, when the fashionable colour is not the colour of her hair. Shall the Indian be pictured without high cheek bones because he desires those points modified?" Articles: "Low Level," "A History with a Moral," "Apprenticeship," "Photographing Children," "Illumination of Studios," "Improvement of Faulty Negatives," etc.

Wilson's Photographic Magazine (New York), among its editorial notes, says, "The prince of hand-camera workers in England, so far as our information goes, is Mr. A. R. Dresser, of Kent. A recent letter from him contains about a dozen lovely bromide prints of dogs leaping and running, and even climbing a tree. They are splendidly caught and fully exposed. Nothing could be better. Added to these are several picturesque groups of natives of Brittany made during Mr. Dresser's recent trip here. Of this trip, Mr. Dresser promises to send us an illustrated descriptive article which will probably run through two or three numbers of our magazine. Mr. Dresser has, at recent exhibitions, taken as many as five medals for his work. We congratulate him on his splendid success." Articles: "An Operator's Hints," "Light," "New Developers," "Husnik's New Autotype Paper," "A New Eye," etc.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

THE Rev. A. B. Whatton was most appropriately selected as Chairman at the meeting of the Club on Thursday evening, the 23rd January, the subject of the paper being "English Church Architecture as a Photographic Subject." It was a most interesting and excellent paper by the Rev. T. Perkins, M.A., and we cordially endorse the eulogiums passed upon it during the subsequent discussion.

The paper opened with a statement which was not allowed to go unchallenged, and which might have raised a long discussion in a larger audience, namely, that photography was divided into scientific and artistic work, and that all photographs might be regarded as intended to have some interest for those who saw them on account of some object in the picture, and to be more or less successful attempts at art. Success in the latter respect was rare, however, and amongst those who now use dry-plates, very few could be regarded as artistic. Men born artists will produce artistic work, some in one way and some in another, but it was as useless to make artists by teaching the laws of composition as to try to make poets by teaching the laws of prosody. On the other hand, the laws of composition are useful to the artist as those of prosody are to the poet. In respect to architecture, there might, however, be a combination of both scientific and artistic work. Faithful representations of many natural objects and of particular places and things would in time be of value, and if the point of view were well chosen, the picture might have some artistic features as well as the scientific ones. It was never more necessary than now that cathedrals and churches should be photographed, as everywhere the restorer, whom they all hated, was at work. Here again we quite agree with the speaker; restorations, except in very few instances, always spoil the appearance of the buildings, and in many cases quite alter their architectural character. But this is an evil not confined to this century; it has existed for a long, long time, and there are to be found few churches in pure style in England to-day. Still, as Mr. Perkins pointed out, if we cannot preserve these old buildings intact, we can at least preserve correct views of them, and it behoves

every photographer who lives in the neighbourhood of an old church to photograph it inside and out, without waiting for the advent of the restoring ogre to apply the spur to his laggard zeal for the beautiful. Coming more directly to the subject of the paper, the reader said that there were in England very few remains of an earlier date than 1,000 A.D. Many of the churches before that time were constructed of wood or wattle work, and were looked upon as temporary erections, but in more than one hundred churches work of an earlier date than the Conquest is to be found. Mr. Perkins then briefly pointed out the various divisions of Gothic architecture, and described the distinguishing characteristics of each, referring in each case to some cathedral or church illustrating the point. They often found a difficulty in getting a good general view of a cathedral or church on account of the houses being in such close proximity, but the best view was generally at the south-east. A sunny day, shortly after midday, when the tower was in shade, was generally the best time; if the tower was to be the point of interest, a view from the west was preferable. If the view were to be taken from the north-east, early morning or late evening was the time to choose. In taking the views the use of a wide-angle lens to its full extent was to be avoided; it was a mistake to get too much on the plate. He would strongly deprecate the use of wide-angles for interiors; the exaggerated perspective was painful and obtrusive, and the falling off in the light towards the margin was a serious drawback. In interiors there was little fear of giving too long an exposure; it was better to over-expose and develop with a weak developer till the detail was out, and then to strengthen the solution, or trust to intensification. It was also well to begin with stop $f/32$ for sharpness, and then to alter it to $f/16$ for light, and to shorten the exposure. In conclusion, he reminded his hearers that it was not only well to get general views, but to look after the interesting and beautiful bits which were scattered about many of the buildings.

A considerable number of slides made by Mr. Perkins were then thrown on the screen, giving views of many interesting churches, particularly those of Somersetshire, and of some of our cathedrals.

The Chairman echoed the advice given to photographers to get views of the churches in their neighbourhood, and expressed the belief that such a course might tend to the creation of a style of architecture worthy of the times. Mr. Gale had nothing but commendation for the paper and the views expressed by the reader, and agreed that the towers of the Somersetshire churches were exceptionally fine. He was of opinion, however, that architecture could hardly be done justice to with small plates, except for lantern purposes, and that had prevented him from going in for it. The churches of Wren, in the City, were well worth photographing, particularly the campaniles, of which there were no two alike. Mr. Whatton was sorry that they had not had some views of the existing wooden churches, especially as he had never seen one of them, though he believed there was one near Epping (Greenstead, near Ongar).

Mr. Davison was of opinion that they ought to make a clear distinction between scientific photography and artistic. The admirable work to which Mr. Perkins had devoted himself was of course scientific in its aim—getting scientific views without any idea of getting pictorial effect. In scientific work they gave as many facts as possible, and expressed them without much consideration of the form of expression in which they clothed their ideas. In artistic work the whole case was altered; they must not offend against truth, but they had also to record the innermost meaning of life or landscape as far as they could without distracting the mind by introducing variety of detail, which could only have prosaic scientific interest. For artistic work, too, they should go to their study without any preconceived ideas as to the point of view or time of day. Those who had a bent for pictorial art would find it out sooner or later, but even if one had great native faculty in that direction, a course of study was equally necessary. Artistic work was, to a great extent, due to long and painful study, and close and accurate teaching of the eye to see. He could not help reminding them of the work of Mr. S. H. R. Salmon in regard to photographing the London churches, which had been mentioned. There was one excellent lesson taught by Mr. Perkins' useful work, and that was that photographers who felt no appreciation of or call to artistic work should have some definite and connected purpose in their photography. This would add greater interest for the worker, and might prove useful to others.

Mr. Perkins briefly replied, and the proceedings were terminated by the Chairman expressing the thanks of the members for the paper.

On Thursday, February 6th, the lantern will be employed to exhibit some Dutch views by Messrs. Elder, W. A. Greene, and others, and some general subjects will also be shown.

Exhibitions.

AMATEUR PHOTOGRAPHIC EXHIBITION AT CASTLE WEMYSS, N.B.

A LARGE collection of beautiful photographs of almost every class was exhibited recently in the spacious tennis court at Castle Wemyss. Although the notice given to the public was very short, upwards of 300 pictures arrived for exhibition from ladies and gentlemen in different parts of Scotland and England. The judges were three professional gentlemen well qualified by experience to perform the duty, and, after studying the pictures carefully, they awarded sixteen prizes—eight firsts and eight seconds.

Amongst the pictures for exhibition, but not for competition, there stood out prominently a few yachting scenes on the Clyde by a well-known gentleman in the West of Scotland, Mr. W. J. Finlayson; two most beautiful hoar-frost scenes, by Mr. Paul Lange, President of the Liverpool Photographic Society; and a very fine enlargement of the "Forum in Rome," by Mr. Henry Erskine Gordon.

In Competition I., Class 1, the first prize was awarded to Dr. J. Cowan Woodburn, and the second to Miss Burns. Twenty pictures were exhibited, "Children and Dog," which secured the first prize, being excellently posed and well lighted, whilst the execution is also good. In Class 2 of the same competition the first prize went to Miss Burns, and the second to Miss M. McNair. There were twenty-eight pictures shown. The picture of "Kelly Burn," by Miss Burns, was very much in advance of any other shown in this class, and easily obtained the first prize.

Competition II., Class 1, consisted of thirty-eight pictures, many being of very excellent quality, both as regards posing and manipulation. The first prize, "Fisherman and Wife," by Mr. D. R. Clark, M.A., a very clever composition; the second prize, "Lady and Dog," by Mr. D. Cunningham, of Liverpool. "Lady and Child," by Mr. Fred. Mackenzie, and a frame of three heads, by Mr. D. R. Clark, are the most noteworthy of other pictures exhibited. Competition II., Class 2, was that in which the largest number of entries were made, and contained a remarkable amount of most excellent work. Mr. Dove secured the first prize for "A View in the Trossachs," and Mr. Taylor the second, for "A View on the Lochy, near Killin. Both are good examples of pure landscape photography. "A Yachting Scene" (instantaneous) by Mr. Turner, and "An Evening Sea View," by Mr. Hinshelwood, secured first and second prize in the third class of this competition.

Mr. Dove and Mr. Clark secured first and second prize for platinotype prints. Mr. Clark and Mr. Cunningham first and second for excellent enlargements. Mr. Clark's "Mosque of Sultan Achmet," in platinum, a very fine picture; and Mr. Cunningham's "Liverpool Exchange," being a good example alike of instantaneous work and enlargement.

In the class for lantern slides there were six entries, the first and second prizes being awarded to Mr. Turner and Miss Collier. The class was good.

The prizes consisted of silver and bronze medals, having on one side a picture of Castle Wemyss, and on the other a suitable inscription.

In the evenings, at the exhibition, a lime-light entertainment was given by Mr. H. E. Gordon, consisting of slides done from photographs taken by Mr. Gordon in Italy, and some beautiful Norwegian scenes from photographs done by Mr. Hinshelwood while in Norway last summer.

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BIRKENHEAD PHOT. ASSOC.—The ordinary monthly meeting of this Association was held on the 9th inst. Messrs. Whimchin and G. Reid Moir were unanimously elected members. After presenting the medals won in the annual competitions to Messrs. Mackrell and Wilkinson (two medals each, bronze and silver), Mr. Lange resigned his position as President in favour of Mr. P. H. Phillips, the President elected for 1890. A vote of thanks to the 1889 officers, for their services during the year, was proposed by Mr. Stainstreet, seconded by Mr. Fattin, and carried unanimously. A somewhat retrospective address was given by Mr. Phillips on his taking the chair, in which address he drew the attention of the members to the enormous strides made by the Association since its inception, and appealed to them to signalise his year of office by their hearty co-operation, in making it a year of even greater successes. Mr. W. B. Beaten (Messrs. J. J. Atkinson and Son) exhibited a flash-lamp invented by Mr. Collins, of Philadelphia, and some Hetherington's films for compound printing. Mr. H. Wilkinson gave an account of his investigations with regard to orthochromatic plates, exhibiting a water-colour drawing and four photographs of same, one on ordinary plate, using a yellow screen before the lens, one on ordinary plate without the screen, and two orthochromatic, with and without a screen. The results were freely commented upon by the members, Mr. Wilkinson's statement that the result obtained on the orthochromatic plate, using a yellow screen, was the most perfect, being fully endorsed by all present. Dr. Stansfield stated that his experience led him to believe that for microphotographic work nothing was gained by using orthochromatic plates. Mr. Frank Vaughan (Messrs. Vaughan and Forbes) then gave a very interesting demonstration on "Photo-Zincography," illustrating it throughout by specimens of work in the various stages, and, where possible, by actual manipulation. Considerable interest was aroused by the development of the latent image on the zinc plate, by Mr. Vaughan, and throughout his explanations and answers to queries were marked by a clearness and lucidity which proved him to be a perfect master of this useful branch of photography. The meeting, which had been of a most enjoyable nature, closed by tendering to Mr. Vaughan an enthusiastic vote of thanks.

BIRMINGHAM PHOT. SOC.—The ordinary meeting was held at the club-rooms, Grand Hotel, January 23rd, Mr. E. H. Jaques, Vice-President, in the chair. The Chairman announced that the President, Mr. J. B. Stone, J.P., had offered a prize for the best set of six views, taken within a radius of ten miles round Birmingham. Mr. Godfree exhibited a very handy bichromate battery for producing an electric light for developing by. Dr. W. W. J. Nicol, D.Sc., then gave his paper on "Iron Printing," which was illustrated with interesting chemical experiments. Mention was made of the different forms of iron printing, the "dusting on" process, sepia-type, platinotype, and particularly his new process, the "Kalotype." This is as follows:—The paper is coated with ferric oxalate 5 per cent., ferric tartrate 5 per cent. On exposure the ferric salt is reduced to the ferrous salt, and is then developed with potassic oxalate 10 per cent., nitrate of silver $1\frac{1}{2}$ to 2 per cent., ammonia sufficient to clear. The print is developed by floating, the same as platinotype. It is then washed in three baths of ammonia 1 oz., citrate of soda $\frac{1}{4}$ oz., water 1 gallon. Specimen prints were distributed, and were much admired, a great advantage being the fixing without the use of hypo, thus securing greater permanence.

BLACKBURN AND DISTRICT PHOT. SOC.—A largely represented meeting of amateur photographers has been held for the purpose of forming a local photographic society. Mr. Tattersall, jun., of Beardwood, who was elected to the chair, explained the many advantages such a society would yield. He read encouraging letters from Lancashire societies, offering every assistance. Judging from the large assembly, he (the Chairman) thought there was every prospect of a good society being formed in Blackburn. Major Baron, of Darwen, moved that the society

CORRECTION.—Query No. 3387, Jan. 24, signed "Tyro," should read, "Hypo-sulphite of soda, 4 ozs.; water, 20 ozs.; 10 per cent. ammonia, 1 drm.;" and not as printed, "Hypo, 4 ozs.; sulphite of soda, 20 oz.; water, 1 drm.; ammonia, 10 per cent. sol."

should also embrace the towns of Darwen and Accrington, and include both professionals and amateurs. He was a member of several of the leading societies of London, which were mixed bodies, and worked together with great success. He proposed that the name of the association be "Blackburn and District Photographic." He felt sure that Darwen would contribute its share of support if an association was formed on a firm footing. Mr. Burrows suggested that ladies be invited to join the association. Nothing definite was come to, but the following gentlemen were appointed (*pro tem.*) to carry out the preliminary arrangements: Major Baron, and Messrs. Garland, Burrows, and Mitchell. It is expected that the Committee, along with Mr. Tattersall as Hon. Secretary, will be the means of forming a successful association. About thirty gentlemen gave in their names as members, and it was decided to call an early meeting to settle about the rules and other important matters. A hearty vote of thanks to the Chairman concluded the business.

BRISTOL CAMERA SOC:—On Thursday last, under the chairmanship of Mr. F. Holmes, a very enjoyable evening was spent at the University College, by the members of the Bristol Camera Society, who attended in goodly numbers to witness a large and varied exhibition of lantern slides. A prize had been offered by the Society for the best six slides sent in for competition by the members. Mr. E. Brightman kindly consented to act as judge, and awarded the prize to Mr. Lavington, a decision which met with general satisfaction. Messrs. Brightman and Norgrove kindly exhibited a selection of their own slides, which were much admired, as were also those sent at short notice by the Ilford Company with their characteristic kindness. In some well-chosen remarks the Chairman proposed a hearty vote of thanks to Mr. Brightman for his kindness in being present, and to the Ilford Company for contributing to the evening's enjoyment. Two new members were balloted for and duly elected.

BRIXTON AND CLAPHAM CAMERA CLUB.—An exhibition of photographs (the first annual show), held on the 20th and 21st, proved to be a highly successful affair. On the walls were shown the prints entered for competition by the members, and also a fine collection of enlargements by the President, Mr. A. R. Dresser. The medal offered by the proprietors of the *AMATEUR PHOTOGRAPHER* was gained by Mr. T. J. Bartrop for a fine "View of Brander's Pass, Loch Awe," the second award in the landscape class going to Mr. T. J. Bradley for "Low Tide, Shoreham." In the class for portraiture, first place was secured by Mr. J. W. Coade, some creditable work being also shown by Messrs. Gorfin and Green. A good display was made in the enlargements class, and Mr. T. J. Bartrop was awarded the Club's silver medal for his "View of Penshurst." Exhibits by Mr. Coade and Mr. F. W. Kent were also highly commended by the judge (Mr. Charles W. Hastings). Mr. Bartrop was also fortunate in taking the award in the class for architectural studies. During the evening the oxy-hydrogen lantern was used to show the competition slides, those gaining commendation being "On the Thames, Moonlight," and "The Lake, Kew Park," by the Hon. Sec. (Mr. F. W. Levett), and also "The Yacht Pilgrim," by Mr. Bartrop. A capital set of animal studies, taken at the Zoological Gardens by Mr. Dresser, were also shown, together with his well-known series, "My Climbing Dog."

EAST DULWICH AND PECKHAM PHOT. SOC:—The usual meeting was held on Friday, January 17th, the President, Mr. F. W. Edwards, in the chair. The subject for the evening was cameras, stands, and shutters. Amongst the shutters exhibited were the following:—Newman's, Watson's snap drop shutters, Kershaw's, Guerry's, Mayfield's, and several others. Mr. Cadett kindly sent three specimens of his shutter, in one of which all chance of vibration was obviated. There was also on view one of Messrs. Perken, Son, and Rayment's Optimus three-fold and one of their four-fold stands, the opinion of the members using which was that nothing more rigid could be desired. A Humphrey metal stand was also shown. The question of cameras was adjourned, as the discussion and examination of the various shutters and stands took up the whole of the evening. Mr. W. Rice drew the members' attention to, and showed a specimen of the new Optimus wide-angle Euryscope lens. This lens, as a wide-angle lens, is a great improvement over the wide-angle portable symmetrical, as, while this latter lens works at $f/16$, the wide-angle Euryscope works at $f/9.50$, this making it an excellent lens for hand-cameras, the angle of view being about the same as the wide-angle portable symmetrical. The following gentlemen were elected members: Messrs. B. Lyon, E. Cann, Robert Burch; and four names proposed.

HACKNEY PHOT. SOC:—On the 23rd, Mr. Hart gave a flash-light demonstration. The chair was occupied by Mr. Grant during the absence of the President, who was called away. Mr. Hart gave an interesting account of the discovery of magnesium, ascribing it to Sir Humphrey Davy. He showed the raw materials from which magnesium was made, experimenting with a piece of sodium on water, which fizzed and finally exploded, proving the explosive nature of one of the ingredients. Specimens of photos taken by a lamp he had constructed were shown, and met with approval from the members. He took a group of a dozen members with six of the lamps spread over a space of 6 ft. to 8 ft., so as to equalize the light. Several questions were asked relative to the lamp used and its various parts. The demonstration was much appreciated, and a vote of thanks accorded Mr. Hart. Mr. Huddle showed a detective camera of his own construction which he had patented, and was bringing out under the name of the "Ideal," through Abraham, of Aldersgate Street. Its changing was done by pulling out a knob. The great novelty, however, was a self-setting time and instantaneous shutter. Its weight was less than the usual run of hand-cameras, and its character was more disguised.

HASTINGS AND ST. LEONARDS PHOT. SOC:—The annual general meeting of the Hastings and St. Leonards Photographic Society took place on January 13th. The officials for the past year were re-elected, and the report and balance-sheet adopted, and seven new members elected. Mr. A. R. Dresser then gave a very interesting paper on "Hand Cameras," illustrated by a number of enlargements and lantern slides produced from hand-camera negatives.

HOLBORN CAMERA CLUB.—The usual monthly lantern night was held on Friday, 24th, when the *Photography* lantern slides were shown before an audience of members and friends in the large room of the Holborn Cycling Club. Friday, Feb. 7th (at 8.0), will be devoted to the instruction of beginners, when "How to Select a Camera and Lens, and How to Use them to the Best Advantage," will be demonstrated by the Secretary and others.

NEW YORK CAMERA CLUB.—The first annual meeting of the New York Camera Club was held on Wednesday, January 8th. The reports of the different officers were read, and that of the Trustees regarding the condition of the Club was very gratifying. On suggestion of the Trustees, a change was made in the bye-laws allowing members of other incorporated photographic societies to become members of the Club without paying the entrance fee. On Friday, January 10th, Professor Romeyn Hitchcock, of the Smithsonian Institute, and formerly of the Japanese Imperial Board of Education, gave, at the rooms of the Club, a lecture on "Japan," illustrated by the optical lantern. Some of the slides were of scenes that had never been photographed—in fact, several of them had never been seen before by a foreigner. The lecture was exceedingly interesting, and was listened to with pleasure and attention by an audience of ladies and gentlemen which completely filled the rooms. Dr. H. G. Piffard, a member of the Club, has proved that ammonia can be used as the alkali in the eikonogen developer, and that it works beautifully. A number of the members are using his formula, which is as follows:—

Boiling distilled water	..	..	1 quart.
Sulphite of soda, crystals	..	..	2 ozs. avoird.
Eikonogen, crystals	..	..	1 oz. "
Bromide potassium	..	..	8 grs.

To 1 oz. of the above solution add from 1 to 2 drops of liquid ammonia, but the latter quantity should only be used in case of decided under-exposure. From 1 to $1\frac{1}{2}$ drops will be sufficient for a properly exposed plate. Dr. Piffard says, "Instead of ammonia, from $\frac{1}{4}$ to 1 drm. of a 1 to 8 solution of carbonate of potassium may be employed. With this latter a little more density can be obtained than with the ammonia. In developing with eikonogen, it is well to carry the density considerably beyond the point that we should consider proper with pyro or ferrous oxalate, as the plate appears to lose more in fixing than with the older developers, and after it is fixed and dried its printing density is not as great as that of a pyro negative of apparently the same strength. Should an eikonogen negative prove too weak when finished, it responds very perfectly to the usual mercurial sulphite intensifier."

PAISLEY PHOT. SOC:—The monthly meeting was held in the committee-room of the Free Library on Tuesday last, Mr. James Donald on the chair. Mr. Mure showed six lantern slides

made on Alpha plates, each one of different colour. They were all greatly admired. The same gentleman also showed a number of photographs, taken some years ago, mounted on cards having bronze printing. Each one was badly spotted, which, he stated, was owing to the action of the bronze on the silver paper. Mr. Harris showed a Greenall's shutter, which, for compactness and cheapness, was strongly recommended. Mr. Morrison then gave a demonstration with Alpha paper. The lecture was most interesting; the subject being treated in a masterly style. He gave a number of hints regarding exposure and development, which cannot but be of practical use to those taking up this interesting process. He also exposed and developed four prints, each having a different exposure, in all of which he was very successful. A hearty vote of thanks was accorded him.

ROTHERHAM AM: PHOT: SOC:—An ordinary meeting was held in the Masonic Hall, on the 14th, the primary object being to enable members to exhibit lantern slides, Mr. Leadbeater undertaking to furnish a triple oxy-hydrogen lantern and accessories. The members had the privilege of introducing friends to the gathering, and there was a fairly large company present, the chair being occupied by Dr. Baldwin. The members' slides were first projected on the screen and criticised. Some of the effects obtained were decidedly pretty, but generally the productions were lacking in vigour. Afterwards, Mr. Leadbeater kindly showed a selection from his stock of lantern slides. At the conclusion of the proceedings a cordial vote of thanks was awarded to Mr. Leadbeater for his efforts.

SCIENCE SCHOOLS (S. KENSINGTON) PHOT: SOC:—A meeting was held on the 14th inst., Mr. Carrodus in the chair. Mr. Smith (demonstrator to the Eastman Co.) gave a demonstration. The new Kodak No. 2 was described, and passed round for examination, with two negatives on the Eastman Company's new films. A very good enlargement was then made on the "B" bromide paper, Mr. Smith pointing out the chief causes of failure. Several questions were asked and answered regarding the development.

WALLASEY PHOT: ASSOC:—The monthly meeting was held on Wednesday evening, the 15th inst., Mr. J. W. Gregg (Vice-President, in the chair. Messrs. C. W. Bullock, D. Kendall, J. G. Parker, F. E. Patchett, Priestley, and Dr. Webster were elected members of the Association. The decision of the Leeds society in the annual lantern competition was read, awarding the prizes offered by the Association. The first (a silver medal) to Mr. H. Wilkinson, and the second (a bronze medal) to Mr. W. Pollard, for the best and second best set of six slides from work done during season. The Liverpool society kindly sent an invitation to the members to view the celebrated collection of Mr. H. P. Robinson's pictures now on view at their rooms. After the ordinary business was finished, the members adjourned to the large room of the Institute, where there was a large gathering of members and friends, and a pleasant lantern evening was passed, opening with an exhibition of the competitive slides. The lecture was of a very interesting character, and was illustrated profusely with a fine series of views taken by the lecturer with a Swinden and Earp's hand-camera. The views consisted of the principal places of interest in Antwerp, Brussels, Rotterdam, Amsterdam, and other cities, finishing up with some humorous scenes from the lecturer's starting point, New Brighton. A hearty vote of thanks was passed to Mr. Earp for his lecture. The evening closed with a display of members' slides, Mr. C. B. Reader ably officiating at the lantern. The next meeting will be held on the 5th prox., when a demonstration on photo-printing processes will be given by Mr. Vaughan.

WEST LONDON PHOT: SOC:—An ordinary meeting of this Society was held at the Addison Hall, on the 24th January, Mr. Chas. Bilton (President) in the chair. The adjourned discussion upon hand-cameras was proceeded with. Mr. Stein, in summing up his previous remarks, said a perfect detective camera must be unobtrusive in appearance, have some mechanical means of changing plates, and at the same time be as simple as possible; the shutter must also be a good one, and work without jar or shake. In regard to the lens, he preferred one of short focus. With a 6 in. lens everything beyond 30 ft. was in focus, but it was often necessary to get nearer to the object, and with a 3 in. lens everything beyond 8 ft. was practically sharp. He used in his detective a $3\frac{1}{4}$ in. wide-angle lens by Wray, and found it worked well. Mr. Lesley Selby, in explaining the Artist's hand-camera, said that it could scarcely be called a detective, because it was not what Mr. Stein had called unobtrusive. However, all

he wished to do with it was to get views, and for that work it answered admirably, as it could be easily and quickly manipulated; moreover, it was light, though strong, and would stand a lot of rough usage. He had taken it up Scawfell Pike without experiencing any fatigue. The following question was then read, "Will the Secretary's arrangements allow any facility for discussion by the members upon the recent exhibition? The Society not having any journal, this is the only way in which the members can express their opinion." After some discussion, it was agreed that the Secretary should convene a special meeting, and notify the members the date thereof. The President said he had just been informed by the Secretary that two members of the Council, Mr. Wyndham Rickford and Mr. Garner Richardson, had presented the Society with a lantern and screen, with accessories for using the limelight. A hearty vote of thanks having been accorded the donors, the lantern was put into operation, and was found to work admirably. The slides shown, being those sent in for competition, were of great excellence, some flash-light views of the exhibition, taken by Mr. S. T. Chang, being very much admired.

WEST SURREY AM: PHOT: SOC:—The annual meeting was held at the Crichton Hall, Clapham Junction, on the 15th inst., when Mr. Gale was unanimously re-elected President; Messrs. Davison, Lyell and Dinsford, Vice-Presidents, the Committee being again asked to continue in office, a vacancy being filled by Mr. James. Mr. J. H. James gave the subject for the evening, "Carbon Printing;" his remarks being illustrated by examples of his own work, actinometers of his own make, and one brought by Mr. Davison, and a fine collection of pictures lent by the Autotype Company. Mr. Davison, by his knowledge of the subject, largely contributed to the success of an interesting evening.

WHAT A SUBSCRIBER THINKS.—"If its present standard is kept up, I have not the slightest doubt that you will remain at the 'top' for many a year to come."

PRINTING.—A subscriber writes:—"Will the readers of the AMATEUR PHOTOGRAPHER give their opinion as to which part of England is most suitable for printing photographs?"

KEIGHLEY EXHIBITION.—A competitor, not a prize winner, thus writes us:—"Just a line to thank you for your kind remarks respecting one of my views at the Keighley Exhibition. It is the more pleasing to myself knowing that it comes from an accomplished and impartial judge."

MESSRS. SAMUEL FRY AND Co. have forwarded us a specimen of the Hibbard repeating flash lamp, which is an ingenious contrivance for holding and puffing forth in small quantities, magnesium powder into a spirit flame. The accompanying cut will

explain its various parts. The india-rubber bottle on the right contains a glass receptacle for the powder, and at the same time acts as a pneumatic expeller for the powder. The power of repeating the discharge is one which will be found very valuable in many cases to which the flash-light is applicable.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editors, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3395. Dark-room Lamp.—I am in want of a dark-room lamp. Kindly give a description of yours, and oblige.—**W. G. EVANS.**

3396. Developer for Foreign Travel.—Re answers to query No. 3329. The writers have entirely misunderstood my meaning. "Sicilian" asks why I cannot take the 10 per cent. pyro. I have not said that I "cannot;" therefore, there is no "reason why." "J. H. Montagu" says I have not mentioned "plates." My inquiry is altogether apart from the question of plates, and relates simply and solely to the consideration of "convenience." This may be a matter of small moment in Great Britain, but it is of great importance when travelling week after week in the desert, with all one's baggage on the backs of camels or mules. Will some reader who has had some experience of desert travelling give me the benefit of that experience by telling me—(1) which of the four developers I named is the most portable, (2) which is least liable to damage and destruction from the breakage of bottles, etc., (3) which is least likely to be affected by a tropical climate, (4) which will keep good for the greatest length of time under these special conditions?—**VECTIS.**

3397. Lens.—Will some one kindly say if there is any difference between a rapid rectilinear lens and a portable symmetrical lens, and, if so, explain the difference and in what way it affects their working capabilities?—**ORDNANCE.**

3398. Printing-out Opals.—If any one of the readers have been successfully working with "printing-out" opals, I should be much pleased to have some information regarding the same. Can a good tone be got readily, and where can either plates or emulsion be purchased of good quality?—**OPALITE.**

3399. Edwards' XL. Pyro and Glycerine.—I have purchased Edwards' XL. pyro and glycerine developer. Will any reader kindly give me a few hints as to its contents and use? Is the following the same?

Ammonia ('880) ...	1.	...	...	1 oz.
Potassium bromide ...		...	...	60 grs.
Water ...		...	...	3 ozs.

Pyrogallie acid ...	2.	...	...	3 grs.
Water ...		...	...	2 ozs.

I see that Captain Abney recommends the following fixing agent. Does it require the same washing as "hypo"?

Sulphite soda ...	...	...	2 ozs.
Water ...	...	...	10 "

to be used only for silver prints. The toning bath used is—

Tungstate of soda ...	...	...	30 grs.
Water ...	...	...	8 ozs.
Chloride of gold ...	...	...	1 gr.

—**E. C. L.**

3400. Repairing Kershaw Shutter.—A small hole the size of a pin point has appeared in the blind. Will any reader tell me the best way to stop it?—**PERTSHIRE FARMER.**

3401. Taking Houses, etc.—I have a wide-angle lens (7 by 5, by Perken and Rayment), and a camera with all movements, but I find it impossible to get a good picture, as I can never get the top of a building

in, and when I do it is quite out of proportion. What is the nearest one ought to be able to get to the object with the lens described? Can any brother amateur give me help?—**IGNORAMUS.**

3402. Shutters.—I intend purchasing either a Kershaw or a Thornton-Pickard time shutter, but before doing so I should be obliged for advice from any person who has had experience with either. Is the latter apt to get out of order?—**THOS. BURNELL.**

3403. Lens.—Does a quarter-plate lens include the same angle of view as a whole-plate lens of the same description?—**MUWA.**

3404. Stereoscopic Work.—As I am thinking of taking up this branch of photography, I shall be glad of any hints on the following points:—(1) Best size of plate. (2) Is the Eastman Company's new film suitable for this style of work? (3) Best form of lens. (4) Best time shutter. (5) Can two separate single views be taken on one plate? (6) Can double printing be successfully done? (7) Is there any book dealing with this subject, or are there any articles in vols. vi., vii., viii., ix., and x. of the **AMATEUR PHOTOGRAPHER**? (8) Any other hints will be gratefully received by—**MUWA.**

3405. View Meter.—Could any reader please inform me with the dimensions of the above as illustrated in page 556 in "The British Journal Almanac" for this year, as they are so poorly printed in my copy I cannot make them out?—**OAK.**

3406. Lantern Slides.—Which of the following developers—viz., pyro, ferrous oxalate, and hydroquinone—is best for making transparencies with equal results on screen? Shall also be glad for a good formula.—**ROBIN.**

3407. Oil Paintings.—I am anxious to get good negatives of old oil paintings, and should much like to get information how to proceed and what plates to use. I have had very fair results with ordinary out-of-door views, etc., with Ilford plates. My camera is a half-plate Lancaster Instantograph. Also, what is the difference in exposure between Ilford ordinary and rapid plates, taking 1 second as standard for ordinary plate on a summer day with largest stop?—**W.**

3408. Hydroquinone.—I develop with Lockyer's hydroquinone developer, and obtain a good image; but on transferring to fixing bath this almost entirely disappears, leaving nearly clear glass. Can any one kindly inform me the cause of this?—**HYDROQUINONE.**

3409. Intensifying Negatives.—I find after intensifying negatives with mercury and ammonia that they get covered more or less with minute holes, like "pinholes," though the negatives originally may be perfect. Can anybody kindly mention some means of avoiding them?—**T. L.**

3410. Tripod.—Can any one recommend me a good tripod to fit McKellen's patent bottom? Must be rigid.—**EVINGTON.**

3411. Pinholes in Negatives, etc.—Could any brother amateur oblige by telling of a good work on taking out the above? My last series of plates are full of them, and some of them have semi-transparent circular spots. They are all landscapes and architecture, so I do not find pencil suitable. I have tried colour, but it seems to get under the edges of the film and makes a mark on the print. Ought it to be mixed with retouching medium or gum? Any hints will be most acceptable.—**J. H.**

3412. Enlarging.—Can any one tell me the best and most powerful gas burner to use? The oil lamp is objected to on account of smoke and smell.—**H. H. W.**

3413. Earthenware Sinks.—Can any of the readers of the **AMATEUR PHOTOGRAPHER** inform me the best place to get photographic sink (earthenware) and stand complete for my dark-room, and oblige—**HENRY DUNDAS.**

3414. Lantern Screens.—I should be much obliged if any one would give me full instructions how to prepare unbleached sheeting to show off the views to greatest advantage. If the prepared surface could be washed merely by sponging it would be much preferred.—**S. E. C.**

QUERIES UNANSWERED.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3353, 3354, 3356, 3358, 3359, 3364, 3366, 3367.

17th.—Nos. 3339, 3370, 3371, 3372, 3375, 3376, 3378, 3379.

24th.—Nos. 3383, 3385, 3386, 3389, 3390, 3391, 3392, 3393, 3394.

ANSWERS.

3274. Magnesium Lighting.—Do not use wire at all for such a purpose. Give two or three good flashes with magnesium powder, taking care to protect lens from direct rays.—**MACHINIST.**

3277. Bichromatised Gelatine Paper.—Yes, certainly, but not so powerful as sunlight. Professional workers invariably use it, so as to be independent of fickle daylight.—**F. K.**

3283. Double Toning.—Ammonia added to hypo ought not to cause any precipitate unless some other agent is present.—**FIDO.**

3284. Clark's Platinum Process.—This querist has probably used impure chemicals, for there are many successful workers, of whom one is—**A. B.**

3289. Strops.—The stop should be placed about 2 ins. in front of the lens.—**KAPPA.**

3298. Lithographic Inks.—These being of a greasy nature cannot be used for carbon process. India ink is the right thing to employ for work on a small scale.—**JIMMY.**

3300. Bitumen.—Only sensitive to a small extent, but it is well to protect it from unnecessary exposure all the same.—**T. T.**

3306. Enlarging.—Surely this querist has access to some kind of a text-book without asking such elementary questions.—**BLOW FLY.**

3312. Enlarging.—Carbon tissue cannot be used for enlarging unless an enlarged negative be taken first. Transfertype paper could be so used. A quarter-plate negative is best enlarged to whole-plate in a camera.—**T. T.**

3318. Church Interior.—Usually the churchwarden's permission to photograph is quite sufficient, but if the vicar is a little tyrant—and there are such—he can refuse the request, for he is tenant at law of the building.—**DISSENER.**

3325. Faded Photograph.—Support the photograph in a good light, stop down your lens, use an isochromatic plate, and go ahead.—**EXPERIENTIA DOCTA.**

3381. Camera on Bicycle.—In answer to above, I can strongly recommend a spring carrier made by Walter Carson and Sons, 21, Bachelors' Walk, Dublin. I have had one in use some months, and find it highly satisfactory.—**O. T. C.**

3382. Framing.—"D. O." had better write to Mr. G. Rees, 41, Russell Street, Covent Garden, for his little book of instructions on frame-making, which also includes catalogue of everything the amateur picture-frame maker requires. I believe Mr. Rees makes no charge for it.—**FESTINA LENTE.**

3382. Framing.—You should read "Winter Work" on Frame-making, in the **AMATEUR PHOTOGRAPHER**, commencing Jan. 17th, 1890; it really gives you a first class idea about it.—**LESLIE BAKER.**

3384. Magnesium Light.—The fault is in the lens. If you had a good Optimus, or Wray's Rapid Rectilinear, you could take with 6 ins. at most. Lancaster's Instantograph lens is too slow for really quick work.—**HURROO.**

3387. Print Changing Colour.—Fix your prints in hypo 3 ozs., water 20 ozs., for 15 minutes.—**HURROO.**

3387. Prints Changing Colour.—The ammonia is the cause of the prints changing colour, and sulphite of soda will not improve them. The prints will always keep their colour if the following formula is used:—

Hypo-sulphite of soda 2 ozs.
Water 12 "
Immerse in this solution, and let them remain for twenty minutes; after this thoroughly wash them. None of my prints have altered their colour after I found out the above method.—**LESLIE BAKER.**

3388. Single Lens.—I have some experience of Taylor, Taylor, and Hobson's rapid view lens, and can strongly recommend it. For landscapes I generally use f/13 stop, which is large for a single lens, and get beautiful definition with it to the very corners. The lens I think is one of 12 in. equivalent focus, but I think a half-plate lens would do remarkably well with a long-extension quarter-plate camera.—**J. RAWLINS.**

3388. Single Lens.—You cannot do instantaneous work with any single lens; it will never be satisfactory. Get a Wray's R.R.; his lenses cannot be beaten at the price, and the R.R. is the best for general work.—**HURROO.**

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—**EDS. AM: PHOT.**

R. T. Y. C.—Camera excellent, films have been reported to stand fresh air. Certainly have a shorter focus lens with you. A hand-camera would be very useful, and we should say the one you name would answer your purpose. We are publishing your letter, and no doubt some of our readers will give you their experience.

THOS. L. BUCK.—We shall be pleased to publish a letter from you on exhibition or other matters, but we cannot take up the controversial subjects appearing in the columns of our contemporaries. If you wish to have the matter thrashed out, write generally upon the subject, and in your own name. (1) The one you name was the last. (2) Our publishers can supply you; write them.

F. A. BRIDGE.—Why don't you advertise them? **E. LLOYD EDWARDS.**—The negative shall be looked up and sent you. The firm have so high a standing that we should not have recommended them had not we been quite certain that their goods would give you satisfaction.

E. B. BOWDON.—Not worth your while to save them unless you have a large quantity. If you have, write us again.

C. D. D.—We will have a search made, and give publicity to what we may find; the apparatus has been popularly described in some of the society papers. Thanks for calling our attention to the subject.

J. LESTER.—Certainly one of the best in the market.

MRS. BROOKHUIS.—Proper entry forms will be sent you on application and receipt of 1d. stamp. A small photograph has quite as much chance of being awarded a prize as a large one.

H. JUDSON.—No doubt Mr. Smith will reply.

MAJOR J. BRIDGE.—Your query is inserted, and will, we trust, be answered.

ORDNANCE.—We do not quite understand the drift of your question; but if you mean that you want to copy pictures to their full size with a 14in. lens, your camera must be capable of opening out to double that length, namely, 28 ins.

STAINED NEGATIVES.—Probably caused by impure developing dish. Try rubbing with linen rag and turpentine.

H. H. W.—Thank you for your prints. Both are good, and show that you know how to develop a clean negative.

T. F. B.—(1) Not important; a swing-back is sufficient for all contingencies likely to occur. (2) Lateral movement only occasionally wanted; back or front immaterial. (3) Turntable saves weight and extra piece to carry; it will not get shaky if well made. (4) No advantage. (5) You can do good work with all named, but the best are more valuable if one wants to re-sell or exchange. (6) About 9 ins., but look at the maker's list, and get a wide-angle lens as well. (7 and 8) You must really refer to the text-books for an answer to these. (9) He is a reliable maker, and you can trust his work. (10) Not to be named in the same category. (11) We know no such worker.

A. B.—You might copy a print under such conditions with lamps close to the copy in about ten minutes. You do not say whether you want to do this work, or a portrait, or an interior. No portrait could be taken under such conditions, and an interior view of a room would take two or three hours.

HAMISH.—The spots look like damp, and we can offer no other explanation in ignorance of the conditions under which it has been kept.

E. D.—There is not much to choose between the two, but perhaps B is a little more compact. (2) We prefer D, but it is not fit for general landscape work, as its tendency is to distort the foreground, and reduce the distance to very small dimensions. Thank you for your good opinion.

ARGOEY.—Dip in fresh hypo for a minute, and then, without washing, into a 10 per cent. solution of ferricyanide of potassium. The immersion in the latter must only be momentary, and the picture must immediately be put in a dish under the tap.

ELENBOROUGH.—The picture is a very pretty one, but would have been much better if you had allowed the figures a little more room on your plate, and if you had kept your camera level.

M. H. N.—You evidently want a lesson from a good master to put you on the right track; it would be quite impossible to do so in this column. Stop down your lens, and give longer exposure to your negatives, they are not sharp enough. Then paint over all that part of them that you do not want to be visible with Bates' black varnish.

C. B.—We fancy that the marks are due to precipitated iron, owing to your chemicals being in some way contaminated. Why not try pyro in preference? You would not regret the change.

TYBO.—We have not used the instrument in question. We may say further that a camera of this type is quite unsuitable for a beginner, who would do far better to practice carefully with the ordinary old-fashioned kind. A child is taught to walk before it is allowed to skate.

G. E. MATTHEWS.—A would be the quicker lens, and B perhaps the better for portraiture. Either lens will, however, answer your purpose, and your best plan would be to try for yourself which one meets your special requirements.

DR. B.—There is no advantage in the use of the instrument named, except that it is slightly more compact than the older pattern.

ZERO.—If we had the choice we would far rather use a single lens made for the purpose, for a tool can always be relied upon if it has been devised for the work in hand. So you will see that the advantage lies rather in the contrary direction to that implied in your question.

A. S.—An over-exposed plate will often appear black under full development, and its film will appear thin after fixation. A wide-angle lens requires a shorter, not a longer camera. The marks on your print are probably caused by the developer leaving certain parts of the plate unwetted. Remedy: Mix up a larger quantity. Thank you for your kind remarks.

F. H. D.—Nothing so good as glass for the purpose. About two minutes, but you must make such a thing the subject of experiment.

ZINKENITE.—A very first-class lens. We can with every confidence recommend it.

H. H.—No. 1 is a good camera. No. 2 is not, we think, yet in the market. No. 3 we have not yet seen; but you can rest assured that the gentleman

named would not speak well of it did not the camera deserve all he said. No. 4 is a useful lens, and well worth the price asked for it.

MISS BROOKING.—You should not have used an instantaneous plate for a portrait study. You had now better intensify with bichloride of mercury, and then treat it with a 10 per cent. solution of hydroquinone. See Wall's "Dictionary of Photography," page 94.

MISS BURNS.—Why did you not send us earlier report? No charge is made, and we are always pleased to receive any particulars having reference to the work done by amateur photographic societies.

HENRY G. RIDGWAY.—We have your letter, and will write you. Note correction in spelling of your name.

CHARLES S. MYERS.—Thank you very much for your kind letter. We can quite recommend plate No. 1. Have heard the same opinions expressed about the plate you have been using. No. 2 is a good all-round cheap plate.

WM. BROWN.—No. 1 is thoroughly reliable. No. 5 extremely portable. Thanks for your good wishes.

MATT-SURFACE PAPER.—Will the writer of a short article on this subject which has reached us, send name and address and oblige?

CORNSTALK.—You cannot enter "Three Tours." Read conditions carefully. "Slurs, Slander, and Sling" are three pretty strong S's, but, in our opinion, well merited. Will write you about the Prize Tour Competition in a post or two.

ST. STEPHEN'S VICARAGE.—Cannot decipher signature. Certainly, enter your Fonth Bridge photographs. By our new plans competitors have ample time to enter for the monthly competitions. Enlargements are not eligible, or prints from enlarged negatives. Why not give us a call? Send post-card, and we will keep appointment.

W. H. SHIRLEY.—You shall hear in a day or two if we can let you have any prints. Might send you some slides. Will send wire if stay at Royton is prolonged to the evening or next Tuesday.

G. FLOSS.—Have corrected and inserted your advertisement free of charge.

D. CAMERA.—We should be quite satisfied to use A for detective work, and do not see any advantage in using the higher priced lenses.

F. A. B.—Send us a stamped envelope, and we will give you the name, but have no intention of giving the man a gratuitous advertisement.

J. W. CHARLESWORTH.—Sorry to hear of the cause of your inability to reply. We will make enquiries about the photograph.

G. H. STAFFORD.—You do not appear to have advised us as to the award. We can trace no report of your exhibition. Your communication might certainly have been couched in more courteous terms. Send us copy of catalogue and judge's award.

J. S. T.—Most of the exhibitions are advertised or announced in the columns of the AMATEUR PHOTOGRAPHER. If you will name any particular exhibitions, we will endeavour to procure entry forms, etc., for you.

W. E. HENRY.—Thank you for the prints. They thoroughly deserve all that has been said of them.

A. REBURN.—We are seeking your prints, and when found will write you; they have been mislaid.

FREDERIC T. CORBETT.—You cannot do better than buy a copy of "Collotype and Photo-Lithography," by Julius Schnaus, published at 5s.; our publishers will supply.

FRANCIS TATE.—We must admit that we hardly see what the man is driving at, but do not hold ourselves responsible for the opinion of our correspondents. You will note that the matter is taken up by one of our subscribers. Glad to hear that you have "for nearly three years read the AMATEUR PHOTOGRAPHER with the greatest of pleasure and profit as there is always something fresh to be learnt from its columns." We hope you may long continue to be satisfied with our efforts.

DETECTIVE.—We take no notice of anonymous letters. Your questions are absurd.

W. H. USSHER.—Cannot make out what you want to know. Why not take up photography proper?

MR. JOHN STABB and Mr. J. Ellis write to us with reference to the rabbetting tool described and illustrated in Mr. Hepworth's article on Frame making of Jan. 17th. The first named tells us that the tool can be purchased of Messrs. Mellhuish, Fetter Lane, and the other gentleman says that he bought one of Messrs. Syer and Co., 45, Wilson Street, Finsbury. Messrs. Syer have sent us their catalogue of tools, which contains sundry contrivances which have been devised for frame-making.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop, or words counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders, should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—AMATEUR PHOTOGRAPHER, April, 1888, to February, 1889, and May, 1889, to date; what offers in half-price view lens, or cash?—Bex, 53, Bury Road, Wood Green.

AMATEUR PHOTOGRAPHER, from 5th March, 1886, to 24th August, 1888 (two missing); also Winter and Summer Numbers for 1886; price 15s.—E. J. Reynolds, Ley Farm, Ilford.

AMATEUR PHOTOGRAPHER, vols. iii. to ix, bound, 11 SOCIETIES' REPORTERS, first vol. "Photography," 12 "Year Books" and "Almanacks," about 50 journals, news, etc.; want offers, photographic materials.—No. 45, AMATEUR PHOTOGRAPHER Office.

Cameras.—Half-plate 84s. Instanto set (Underwood's 1888), new; bargain, 60s.—2, Hawthorn Villas, Slad Road, Stroud, Glos.

Camera, quarter-plate (by Robinson, London), damaged; price 10s. 6d.; cost 21s.—Deane, School House, Ronall, Fleetwood.

Rouch's patent half-plate tourists' camera, fitted with Hare's changing box for 12 plates; £5.—G. E. Franklin, Rickmansworth.

Camera Bellows.—Camera bellows. Amateurs requiring such should apply direct to the manufacturer. Every description made. Manufacturers supplied at reduced prices. Stamp or reply.—J. Johnson, Back 131, Irving Street, Birmingham.

Cameras, etc.—New modern long-extension half-plate camera, three double improved slides, square bellows, stereo arrangement, of the best London make and finish.—Eggar, 5, Chandos Road, Stratford, E.

Whole-plate Sands and Hunter's camera and shutter, with Dallmeyer's 10 by 8 R.H. lens, sundries; for sale; particulars.—W. Charles, Duns, N.B.

Dark Slides, etc.—Three Tylar's metal slides and Lancaster's two-fold mahogany tripod; for two mahogany slides for Instantograph.—61, King's Road, Southsea.

Set of six half-plate Tylar's metal dark-slides, equal to new; 18s. lot.—F. W., 15, Canal, Salisbury.

Gas Jets, etc.—Pair of mixed gas jets and six-way dissolver, bargain, the lot 25s.; also six Tylar's quarter-plate metal dark-slides, 7s. 6d.; approval; deposit.—Geo. Elly, The Stores, Uttoxeter.

Kodaks.—Kodak, containing film for 80 exposures, only been used once, in perfect condition; £4.—Can be seen at the Stereoscopic Company's, 110, Regent Street, W.

For sale, an Eastman's Kodak, with 50 films not used, quite new, only once charged; price £3 15s.—Apply, L. F., Denny Court, near Uxbridge.

Lanterns.—Archer's Photinus, complete in case, four-wick patent lamp, 4 in. condensers, new last November; price, cash, £4; bargain.—Harrison, Registrar, Warrington.

First-class jappanned tin binomial lantern, with best compound condensers and double achromatic fronts, scarcely used, pair safety jets and star dissolver, complete; price only £3; few slides, including some Newton's hand-painted, cheap.—G. Franklin, Rickmansworth.

Lantern, etc.—Hughes' Pamphengos lantern, perfect condition, 40 slides; will exchange for half-plate set.—O. Naylor, Batley.

Lantern Slides.—Lantern slide apparatus, for making slides from negative; cost 16s. 6d.; price 7s. 6d.—Bentley, Low Baildon, near Leeds.

Lenses.—Fair Dallmeyer's new stereoscopic lenses, working at about f/5; price £4; approval on deposit.—L., 6, Suffolk Terrace, Gardener's Lane, Putney, S.W.

12 by 10 landscape lens, 15 in. focus, 15s.; or exchange quarter camera or quarter rectilinear lens.—Ernest Webster, Driffield.

Exquisite Silver-ring rapid Rectigraph lens (by Lancaster), quarter-plate, has Iris diaphragm, and is fitted with instantaneous shutter working between lenses, pneumatic ball, etc., perfect, and good as new; only 30s.—Box 1, Mallow.

Lenses, etc.—Splendid cabinet portrait lens, f/4, sacrifice 35s., cost treble; retouching desk, perfect,

takes any size to whole plate, bargain, 5s.; 8 by 7 interior background, 7s. 6d.; 8 by 6 graduated, 5s., both canvases; 5 by 4 Optimus R.R., Tyler's window shutter, fitted, 24s., new.—Cooke 49, Chapel Street, Rugby.

For sale, whole-plate R.R. lens, revolving diaphragm, splendid definition, cheap, approval, deposit; also exchange 9 in. burnisher and lamp, as new, cost 35s., for quarter-plate Instantograph camera, lens, and slide.—Evans, Minthead, Somerset.

Excellent Lancaster half-plate instantaneous lens Iris diaphragm, shutter, never used; 20s.; cost 30s.—H., 7, Crescent, Taunton.

Half-plate Instantograph lens, with shutter and Iris diaphragm, good as new; 20s.—Walsh, 179, Walter Street, Blackburn.

"Photography," from commencement to Dec., 1889, 59 numbers, clean, complete; also "Anthony's Annual;" best offer has them.—No. 10, Albion Street, Mills Plating, Manchester.

Photographic Sundries.—Shew's patent camera clip, Phoenix shutter, Sargeant's patent shutter, box view-finder, ebonite view-meter, circular level, Deconun's photometer, four Eastman half-plate film holders, black morocco leather bag with lock, lined green baize, for half-plate camera.—W., 43, St. James's Road, Kingston-on-Thames.

Sets.—Half-plate Instantograph set, complete, four slides, carriers, case, printing frames, as new; 80s.—Edward Mason, Askridge, Bedale.

Quarter-plate set, including camera, of best movements, three double slides, two lenses, single and double, instantaneous shutter, and light stand, perfect condition; price 50s.—S., 11, Tavistock Street, W.C.

Camera, half-plate, 1889 Instantograph, by Lan-

caster, in very finest order, and guaranteed genuine in every part, fitted with reversing back, leather bellows and double extension, Instantograph lens and shutter, Iris diaphragms, double dark slide, quarter-plate carrier, and double folding mahogany tripod, latest improvements; approval; 74s.—Ousins, 5, Stanley Villa, Bruce Grove, Tottenham.

Slides.—Would exchange four slides, "Bite bigger, Billy," for four British scenery; approval.—Jaquiss, Cradley, Staffs.

Tripod.—Sliding ash camera tripod, best make, suitable for half-plate to 10 by 8; cost 25s.; price 15s.—W., 43, St. James's Road, Kingston-on-Thames.

WANTED.

Cameras.—Hand-camera, cash; approval required.—A. Blackburn, 3, Belgrave Crescent, Eccles, Manchester.

International half-plate camera or quarter set; exchange six vols. "Casket of Literature," complete; offers.—L. Fry, Greenfield, Oldham.

Half-plate bellows camera and slide, must be cheap; or will exchange 13 in. focus 10 by 8 view lens.—A. Gillies, Novar, Rosshire.

Half camera, good make, cheap, for cash.—Particulars, Arthur Hardy, Hartlepool.

Wanted to purchase, half-plate camera, good make; price and particulars.—Weatherby, Eiton Street, Hanley.

Fallowfield's Fac's detective camera.—Apply, Camera, Observer Office, Claremont, Hastings.

Good whole-plate camera, in exchange for nearly new half-plate, with three double slides.—Jones, Enfield House, Uffculme, Devon.

Camera, etc.—Quarter-plate camera and lens, or

good magic-lantern; exchange handsome red setter dog pup, eight months old.—Patrick Moore, Ross-carbery, Ireland.

Camera, lens, etc.—5 by 4 first class camera, R.R. lens; cash by deposit.—L. Davidson, 79, South Circular Road, Dublin.

Hand Camera.—Hand camera, not less than 5 by 4, in exchange for Rouch's dark tent for changing or developing plates, at or from home, with tank, tray, tripod, and chemical case.—Henry Irving, Darwen, Lancashire.

Lenses.—10 by 8, or 12 by 10, good make, symmetrical, rectilinear, or Euryscope lens, cheap, for cash.—Arthur Hardy, Hartlepool.

Half-plate R.R. lens, in exchange for good violin, dated 1721.—Trigg, 31, Bernard Street, Southampton.

Lens, etc.—Half plate Wray, Beck, Taylor (Iris), Optimus R.R., or Optimus Euryscope, cheap.—Batty, Denman Drive, Liverpool.

Negatives.—A few good half-plate view negatives, cheap, for a charitable purpose.—Particulars to S. Barclay, 232, Mill Street, Liverpool.

Roll-Holder.—Eastman roll-holder, to fit 7½ by 5 camera; state lowest price.—B., care of Sergeant Brady, R.I.C., Ballymena, co. Antrim.

Sets.—Good half set, no lens, several slides, tripod, accessories, cheap.—86, Albert Road, Croydon.

Good half-plate camera, lens, dark slides, etc., complete.—Spencer, Surveyor, Crawshawbooth, near Manchester.

Shutters.—Quarter-plate instantaneous and time shutter, 1½ in. hood.—Ploss, 309, Liverpool Road.

Thornton's time and instantaneous shutter, diameter 1½ in., on approval.—M., 26, Highbury Quadrant, N.

NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the *Amateur Photographer* are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISEMENT DEPARTMENT.—All communications respecting TRADE Advertisements in the *Amateur Photographer* are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editors, *Amateur Photographer*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—To ensure insertion all Communications should reach the Editors on Tuesday.

CORRESPONDENCE SECTION.—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editors, *Amateur Photographer*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the *AMATEUR PHOTOGRAPHER* have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

First Prize	Silver Medal and £1 1s. 0d.
Second Prize	Bronze Medal and 10s. 6d.

Photographs must be sent in on or before **Monday, the 10th of March**. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the *AMATEUR PHOTOGRAPHER*, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition," The Editors, *Amateur Photographer*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the *ANNUAL*, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.	
28th February	Apparatus.
28th March	Optics.
28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: Their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August	Artistic Effect and Composition.
28th September	Outdoor Instantaneous and General Photography.

All MSS. to be addressed to the Editors, "*Amateur Photographer*," 1, CREED LANE, LUDGATE HILL, LONDON E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

The Proprietors of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	Feb. 14 ... June 14.
LANDSCAPE WITH FIGURE	Mar. 14 ... July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	May 14 ... Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs will be reproduced in the *AMATEUR PHOTOGRAPHER*.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

THE AMATEUR PHOTOGRAPHER

[PRICE TWOPENCE.]

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare

We are very pleased to, at last, be in a position to announce that the "Home Portraiture" Special Number of the AMATEUR PHOTOGRAPHER will be published on the 1st of March. There will be upwards of fifty illustrations in the body of the book, selected from the work of as many competitors, and the following whole-page supplements:—

- From the First Prize—"Children of the City" (autotype), Alex. Keighley.
- „ Second „ "Meditation" (Woodburytype), Alfred Stieglitz.
- „ Third „ "Day Lilies" (colotype), Mrs. Brian Hodgson.
- „ Fourth „ "Little Lord Fauntleroy" (colotype), A. R. Dresser.

The book will be got up in a far better style than any of the previous Special Numbers of the AMATEUR PHOTOGRAPHER, and its publication cannot fail to teach workers in photography through the examples illustrated. We would remind our readers that the conditions of the competition permitted the entering of figure or genre subjects, taken either indoors or out-of-doors. They will therefore find, in addition to portraiture, many such subjects reproduced.

Our publishers will be glad to receive early orders. Copies sent by post will be packed in boards or cases, in order to protect them from the rough usage they too often have received at the hands of the postal authorities.

* * * *

THE prints for the next AMATEUR PHOTOGRAPHER Monthly Photographic Competition, "Landscape or Seascape," must be received on or before the 14th inst. Those who have not received entry forms should make early application.

* * * *

WE would call the attention of our readers to the "Monthly Competitive Papers," and remind them that the first subject is "Apparatus." They are asked to give their experience of any piece of apparatus used in connection with photography. The papers sent in to this competition must not exceed 1,000 words in length. We are sure that there must be a large number of our readers who

will be glad to embrace the opportunity which these "Competitive Papers" in conjunction with the "AMATEUR PHOTOGRAPHER'S Annual," afford of giving the benefit of their experiences to their fellow-workers. MSS. must be received on or before the 28th inst.

* * * *

SLIDES for the AMATEUR PHOTOGRAPHER "Lantern Slide Competition" should be sent to us as early as possible, in order that they may be carefully registered preparatory to being judged. Arrangements will be made to exhibit as large a number as possible at the Crystal Palace Photographic Exhibition. As soon as the arrangements have been definitely determined upon with the Managers, the dates of the lantern shows will be announced.

* * * *

WITH the last number of the PHOTOGRAPHIC SOCIETIES' REPORTER a very exhaustive index is inserted. Binding and reading cases have been prepared, and can be obtained of the publishers. The first volume of the REPORTER contains upwards of 500 pages, and although far from fulfilling the aims of the promoters, is nevertheless a valuable record of the work of photographic societies during the year 1889. It is to be hoped that officials and members of societies will do their best to assist in making the REPORTER a complete record of all that is done in connection with their own particular societies, and so render help for the benefit of the community at large.

THE PHOTOGRAPHIC SOCIETIES' REPORTER is deserving of the support of all workers in photography, as through the publication of it the promoters earnestly hope to be able to establish a complete record of the advance of the science of photography and its progress in its relations to art. We note from a brief glance at the index that more than 120 societies have sent up their reports during the year, but not with the same regularity as the meetings have been held. We also note that many papers read are given *in extenso*, and that not less than 300 subjects affecting photography are treated of in its pages—surely a sufficient inducement to both professional and amateur photographers to subscribe 6s. PER ANNUM, especially as that sum includes

TWELVE CABINET PORTRAITS of presidents of photographic societies, all more or less having a reputation for work done in connection with the advancement of photography. We have, of course, a very direct interest in asking our readers to subscribe to the REPORTER, and do not hesitate to say that the embarking upon the publication of such a journal was a step which few, if any, of our competitors would have had the boldness to tackle. It has faults, and we will do our best to rectify them; but as was said in the first number, the REPORTER must be, to a great extent, what members of photographic societies make it. May we then urge upon our readers to contribute their part, and accept our assurances that no effort will be wanting on ours to make the REPORTER more useful in the future than it has been in the past.

* * * *

THE *Athenæum* says of the PHOTOGRAPHIC QUARTERLY:—"The articles are clearly written, terse, and on subjects of the day. . . . The frontispiece of the second number, 'Harmony,' by J. E. Austin, is one of the most perfect pictures we have yet seen produced by photography. The tone and sentiment are alike admirable. There is a future for this new quarterly if the first numbers be maintained." Such a criticism is most encouraging, coming as it does from the highest and most critical literary authority in the world. It will prompt us to greater efforts to collect together the *best* work of the *best* men for publication in the QUARTERLY, which the *Photographic Art Journal* is kind enough to say "adds a dignity to photography."

* * * *

WE have for a long time had in contemplation the offering of prizes for artistic photography the work entirely of ladies. Latterly ladies have timidly entered the lists in competition with the sterner sex, and their work is much of it of a high artistic standard, and we intend therefore to offer some inducement for them to enter into the AMATEUR PHOTOGRAPHER "First Ladies' Competition." We shall give as prizes gold, silver, and bronze medals, of the smaller series, mounted as brooches, and shall include on the bench of judges the services of a lady artist and a lady photographer. The rules and conditions will be published in the first issue in March, and all photographs will have to be received on or before the 31st of May. The photographs will probably be exhibited at our offices during the month of June. Ladies desirous of entering for this competition are asked to forward their names and addresses and an addressed stamped envelope, in order that the rules, conditions, declaration, and entry forms, when ready, may be sent to them.

* * * *

ON all sides we hear that the Exhibition at the Crystal Palace will be a huge success. The movement deserves support, and the annual show there has become a necessity to photographic life. All the novelties are to be seen, and although actual orders may not be booked by exhibitors, still the opportunity is given to those requiring apparatus to inspect the various manufactures and designs, the orders following at a later date as a natural sequence.

* * * *

LAST week Mr. Clinton Dent delivered a lecture at the Working Men's College, Great Ormond Street, on "Mr.

Donkin's Photographs of the High Alps." The lecture was illustrated by dissolving views. Mr. Dent said that sixty years ago very little had been done in the way of photography in the High Alps. A few sketches had been taken, but they had caused a great deal of labour. It was in 1879 that Mr. Donkin saw what might be done in that region. Mr. Donkin had secured photographs of glaciers under great difficulties, and he always said that the "Upper Snowfields" were more worth exploring than some of the jungles and the slopes of Africa.

* * * *

OUR editorial comments upon Exhibition matters have brought forward a letter from one of our subscribers. We hope our readers will not refrain from expressing their views upon "our views." The conditions of the professional classes should be much more stringent. At the present time we venture to say that in no case are professional exhibits the individual work of the exhibitor; how absurd it is then to propose to place such work on a level with that exhibited by amateur photographers! The AMATEUR PHOTOGRAPHER has purified photographic exhibitions of all the tricks and dodges which obtained prior to 1885, so far as the work of amateurs is concerned. Why do not trade papers follow on our lines and do the same for professional photography, instead of carping and sneering at that which they have had no hand in, *i.e.*, the elevating of honest work, which has resulted in the advancement of photography as a science and art, and in bringing forward the latent talent of amateur photographers all over the world.

Who should write about the medal craze? Not our contemporary *Photography*, for they take traders' medals by the dozen, and when honest judges have thrown out competitors' work as worthless, will allow traders to give consolation medals to unsuccessful competitors. But what can be expected from the staff of a paper that competes for the medals given by themselves, and whose editor and sub-editors accept traders' medals?

We shall continue to award our medals for merit and for work that is entirely that of the exhibitor. But we will not from this date consent to place the AMATEUR PHOTOGRAPHER medals at the disposal of any Exhibition Committee, where *any* class is open alike to professional and amateur photographers, and we are quite certain that the bulk of the ladies and gentlemen who make up the army of amateur photographers will stand by us and refrain from entering their work in the same class and for the same prizes as professionals. It is well known that many professional photographers do not hesitate to pass the work exhibited as their own, through the hands of (1) operator, (2) worker in dark room, (3) retoucher, (4) printer, (5) mounter, (6) frame maker.

We call it dishonest, as dishonest as the specimens exposed in the "art photographer's"—save the mark—window. Let our contemporary *Photography*, who will not, we suppose, have the audacity to claim to be the journal of the amateur photographers, set itself to clear away the dishonesties of the professional photographer, and leave the amateurs to arrange their own exhibitions, draw up classes and conditions, and award for the work exhibited, such prizes as the means at their disposal will permit, without wasting their money upon the too often meretricious work of professional photographers.

It will be remembered that last year the Photographic Society of Great Britain held their first annual dinner, a function to which ladies were admitted, and one which was a very pronounced success. This year's dinner is to be held on the 10th inst., under the genial presidency of Mr. James Glaisher, F.R.S., the veteran President of the Society.

* * * *

THE work shown at the Brixton and Clapham Society's show last month was, on the whole, very satisfactory, especially in the Enlargement Class, and the Society is to be congratulated on the success of its first effort in that direction. The lantern slides, however, were a rather weak section, and showed considerable difference in merit, though the slide which took first prize, a sunset view on the sea beach, was a most effective and well executed piece of work.

* * * *

THE AMATEUR PHOTOGRAPHER Bronze Medal offered to the Darlington Photographic Society, for their members' competitive exhibition, has been awarded to T. Howlett, Darlington. The judges at the above exhibition were J. B. Payne, Newcastle-on-Tyne; A. L. Seavenson, Durham; and Edgar E. Lee, Cullercoats.

* * * *

PHOTOGRAPHY ON ZINC.

THE appearance of a daily illustrated newspaper is an event for which the public have been for some time prepared, for they have been accustomed to notice in certain pushing evening journals, and on rare occasions in the dailies—once or twice even in the *Thunderer* itself—that the aid of the artist has been called in to give a zest to the letterpress. This has only been done, until quite recent times, on rare occasions, or when any particular object might be served by it. Thus a rough portrait of Lefroy, the murderer of Mr. Gold, which appeared in the *Daily Telegraph* many years ago, led directly to the arrest of that villain. And these pictures must be rough, for they are necessarily printed with such celerity that they cannot be nursed up to that perfection which is possible with more delicate work. The paper, too, of a daily newspaper is not of a character to show up a cut to the best advantage, and is very different in texture, surface, and general appearance to that which is used for the leading illustrated weekly journals.

It goes without saying that a daily journal containing illustrations would be next to impossible without the aid of photography, and to the uninitiated the curious part of the business is that the camera is not used to take the original picture, but in the work of turning that picture into a block ready for the printing press. But where is the engraver? it may be asked. The engraver is literally nowhere, for under the new condition of things he and his work are not wanted. They have been superseded by the greedy camera, which seems to step in to do other people's work in all branches of art and science.

A most extraordinary part of this new process of block production by photography, is its extreme quickness. We are told on good authority that on the new premises of the *Daily Graphic* the arrangements for performing this work are so perfect that a sketch handed in by the artist can in the short space of two hours be reproduced in block

form ready for the printing press. The sketch must necessarily be of a suitable kind for reproduction, and must partake of the character of a pen-and-ink drawing, that is to say, it must be expressed in lines. There are, of course, processes for the reproduction of half-tone pictures, and sketches done in washes of tint like sepia drawings, but these take much longer to execute, and when produced are not suited to hurried printing. We are at present, therefore, only considering the method of reproducing line drawings, or, at any rate, drawings which are expressed in lines or dots, or perhaps a combination of both. It is known in the trade as the zinc process, which is the short for zinc-photography, for the printing surface which it yields is of zinc.

The original drawing is executed in very black ink of a special kind, or sometimes india ink is used, although that medium has a tendency to dry on the fine pen used for the work, and in that way leads to delay. Ordinary Bristol board may be used to draw upon, but those who aim at the best work use a chalk-surfaced paper which is made for the purpose, and upon which the most delicate line can be made, a line with clean sharp edges such as it is difficult to trace on any other medium. This drawing is handed to the photo-engraver, with a note appended to it as to the amount of reduction it is to be subjected to, for it naturally gains in delicacy by being reduced in size, and it is almost the invariable custom for an artist to rely upon this in executing the work.

The photo engraver's first business is to take a negative of the drawing, and this he does by the light afforded by the electric arc, for were he to depend upon daylight his occupation would be often gone. The negative must be reversed, and this reversal is brought about during exposure by the use of a mirror, silvered on the surface to avoid double reflection, which is attached to the hood of the lens at an angle of 45°. The camera, therefore, is not pointed direct at the drawing to be copied, but at right angles to it. The wet process is adopted for the production of the negative because it gives, with the least trouble, a negative in which the lines are perfectly clear, and the blacks really opaque. This is a very necessary provision in a negative intended for this "process" work, one which did not fulfil these conditions being altogether useless.

The zinc plate now comes into requisition. It is sensitised with bichromatised albumen, and exposed under the negative, with the result that all parts of it through which the light can get are made insoluble. These parts are, of course, the clear lines representing the lines of the original drawing. Development consists in dissolving away all the remainder of the sensitive coating, leaving on the zinc plate the picture expressed in lines of insoluble albumen. These are further strengthened with an acid-resisting compound, and the metal plate is placed in a rocking dish where it is exposed to the action of dilute acid. The exposed portions of the metal—that is, the parts not protected by lines—are quickly eaten away, leaving the lines in relief. When this etching operation is concluded, it merely remains to mount the zinc picture, type high, on a block of wood, and it is ready for the press. Such are the bare outlines of the modern process which turns, as by a magician's wand, a drawing into a metallic block—a process which has at last been instrumental in the establishment of an illustrated daily paper in London.

Letters to the Editors.

EXHIBITIONS AND THE MEDAL CRAZE.

SIRS,—May I ask the privilege of a little space to say a few words in regard to exhibitions, and the movement in some quarters to unite the amateur and professional classes, or rather to abolish the amateur classes altogether? I think it does not require a very great effort to see that the movement comes from the professional exhibitors.

Is it because, having secured a goodly number of medals each themselves, they are now wishful to almost banish such awards, and consequently make them much scarcer, apparently trying to forget that the most valuable medals, and by far the greatest percentage to number of exhibitors, have been given to the professional classes?

I admit that certain classes might go, professional as well as amateur; but to take the dictum of certain self-appointed dictators I think we shall decidedly object.

The great scare about the medal craze, etc., would lose its chief *raison d'être* were the professional classes excluded from exhibitions (not that I necessarily contend they should be).

I should think it would be interesting to see what percentage of awards to number of exhibitors have been given to amateur and professional classes respectively these last two or three years. The less said about the medal craze by our professional friends the better.

Then again we are told that the present system of medal awards is very detrimental to photography as an art. This statement I most emphatically contradict, and challenge any man to prove. When, I ask, in the history of photography, was the standard of art therein so high; and why? Simply, sirs, because of the *present* system of awards, which brings out, with some prospects of recognition, the dormant, or rather what would be dormant, artistic powers and genius of our country; and I maintain that ere a few more years have run, the present system of awards remaining, photographic art will forge ahead with leaps and bounds, hitherto unknown in all the glorious history of photography, and this by and through the instrumentality of the amateur and amateur's medals.—Faithfully yours,

THOMAS L. BUCK.

January 20th, 1890.

* * * *

PHOTOGRAPHY IN AMERICA.

SIRS,—The annual election of officers of the Mystic Camera Club took place on Tuesday evening, January 7th, when the following officers were chosen for the ensuing year:—President, Geo. E. Davenport; Vice-President, A. F. Boardman; Executive Committee, Messrs. Geo. E. Davenport, A. F. Boardman, Geo. L. Stone, E. H. Balcom, B. D. Bourne, and E. Lawrence Jenkins; Secretary and Treasurer, Geo. L. Stone (1, Ashland Place).

Active preparations are being made by the club for a public exhibition in February of the past season's work of the organization.

British correspondence solicited.—Yours very truly,

Medford, Mass., U.S.A.,

Geo. L. Stone (Sec.)

January 16th, 1890.

* * * *

DISCS OF GLASS AS CONDENSERS.

SIRS,—I have been looking anxiously for an answer to "Treble X's" query, No. 3,370, in the AMATEUR PHOTOGRAPHER of January 17th, from some one who has succeeded in making a condenser in the manner referred to, a similar query of my own some six months ago having also remained unanswered. Failing this, it may be of some use to him and others to relate my own experiences in endeavouring to make a lantern for enlarging purposes. I procured two 10 in. clock glasses, cemented them to two flat discs of glass, filled them with glycerine, and, as I am no turner, mounted them in a square oak frame by means of parallel grooves on the inner faces in such a manner that the two convex surfaces nearly touched. I carried them off to my dark-room, put a candle behind, and examined the result. This was woefully disappointing. The illumination was very unequal, a ring of bright light enclosing a darker space in the centre. This was due doubtless to the (optically) faulty curva-

ture of the glasses, which were much more bent at the edges than towards the centre, this portion being nearly flat. Then the focus was very long, about 16½ in., and the illumination in consequence feeble. I acted on the supposition that the illuminant should be placed at the equivalent focus of the combination, i.e., in such a position that the issuing rays are parallel, or nearly so.

In spite of this failure I cannot help thinking the plan is feasible, if only glasses of proper curvature could be obtained. I imagine they should be segments of a sphere of longer or shorter radius, according to the focal length required, but I am no optician, and should be very grateful to some cleverer brother of the art for definite information as to—

(1) The proper form of the glasses; if spherical, then the radius of the sphere which would give, say, 9 in. focus, or less, if the curvature would not then be excessive. It would not be difficult, I imagine, to get glasses bent to the required shape.

(2) The proper position of the illuminant.

(3) A good cement to use for uniting the glasses. I used shellac dissolved in rectified spirit, but this took a long time to harden.

Thus baffled in the construction of a condenser, I tried ground-glass for distributing the light evenly over the negative, and constructed a suitable lantern of wood to hold two duplex lamps. But I found that at least two ground glasses were necessary for perfectly even illumination, to the great diminution of the light, and then the intense heat of the lamps nearly fired the roof of the lantern, though this was protected by a zinc plate with half an inch air space between it and the roof.

So altogether I must confess myself fairly nonplussed and stuck in the mud, and shall be very grateful for help in my difficulties, for I have time to spend and some constructive skill, but have not cash to spare for an expensive enlarging lantern, while daylight is not to be had in my dark-room.—Yours faithfully,

W. L. GROVES.

January 31st, 1890.

* * * *

QUERIES AND ANSWERS.

SIRS,—Being only an amateur, I get much help from the Queries and Answers column, but think I should often get much more if those who are kind enough to send answers would be more explicit, viz., not think because they know so well, that others do who have not the privilege of meeting in clubs, etc. For the same reasons I should be glad if some of our learned brothers would favour us with a few short chapters on cause and effect of the developer on the film of a negative, the difference between a few of the many kinds of plates, the names of which are bewildering, viz., gelatino-bromide, chloride, isochromatic, and so on, so that we should understand a little more what we are doing; instead of being so mechanical. Knowing better and using a little brains, we may get less failures and better work. We working men want something after the style of the articles on Frame-making.—Yours, etc.,

A WOULD-BE IMPROVER.

* * * *

TRANSFORMATION OF FORMULÆ.

SIRS,—I agree entirely with your correspondent, Mr. Nash, as to the desirability of transforming from metric to English weights, and *vice versa*, otherwise than by literal translation, or rather conversion, but, thinking that I can suggest a handier method than the one he proposes, I venture to bring my plan forward.

Now, let us say that the metric formula (as it generally does) commences with 1,000 grammes, or cubic centimetres, which is the same thing. Put against that *any* suitable quantity of ounces, say 40 ounces = 19,200 grains, and then take the same percentages for the English formula as are taken for the metric formula. For example:—

1,000 c.c.	..	..	..	..	40 ozs. = 19,200 grs.
100 grammes	=	10 per cent.	=	4 " "	1,920 "
20 "	"	2 "	"	"	384 "
5 "	"	½ "	"	"	96 "

The same method may be used for conversion from English, although it is not quite so simple, and there is also the difficulty that English formulæ generally end with "make up to," so that

the percentage is not easily found, but I do not see many occasions on which we shall require to reduce from English to metric formulæ. This would rather be a problem for the "other side" to work out, if there be, forsooth, one more brave Gaul or Teuton left who will venture to risk his brains about our, to him, bewildering arrangements of weights and measures.—I am, Sirs, yours truly,

WATERLOO.

* * * *

STAINS.

SIRS,—May I, through the medium of your valuable paper, invoke the kindly aid of Mr. Bothamley, or some other scientific gentleman, in elucidating the following point.

Having used it, say, eight or nine times, my hot-bath platino-type developer, although quite clear, becomes badly discoloured by iron from the paper. And although I do not notice any falling off in tone of prints developed in such a bath, yet, should any oxalate run over the back of a print (to avoid which is almost impossible) it leaves a yellow-brown stain, distinctly visible by transmitted light, which no amount of soaking in acid will ever remove. Doubtless, the moral is obvious; but to be continually throwing away developer adds to the cost of what is already a sufficiently expensive process.

By allowing most of the developer to pass off as steam, and the addition of water, I find that the solution, while far from colourless, is certainly less yellow.

Information as to any means of getting rid of the iron without impairing the neutrality of the oxalate, will greatly oblige, yours truly,

J. T. TAUNTON.

* * *

COST OF DRY PLATES.

SIRS,—Your correspondent "Auld Reekie" cannot see why half-plates cannot be made at 13s. per gross or less. Perhaps I can enlighten him. In the first place, the quality of glass such as is now used by the best makers cannot be purchased for less than 6s. per gross, and the cost of good emulsion, rich in silver, to coat that quantity, allowing a little for waste, will cost 8s., boxes and wrappers, 6d.; this, without labour, brings the cost to 14s. 6d. Now, the usual price for half-plates is 2s. 3d. per dozen, and on that a considerable discount has to be given to the trade, so I do not think that the makers are making big profits. If it had been so, how is it that several manufacturers, some of whom had attained a fair reputation for plates, should have given up business after considerable losses? There is at the present time more than one firm who had they known the difficulties and worries connected with dry-plate manufacturing would never have commenced, but having invested their money and gained experience, do not now wish to sacrifice both, although the profit at present prices is very small. Another important fact must be taken into consideration. There is scarcely any business where there is so much waste, however great the care taken, such as broken glass, occasionally bad batches of emulsion, and defective plates; all these increase the cost.

I may just add that I have had great experience in all these matters, but am not in any way commercially connected with any business.—I remain, yours truly,

EMULSION.

* * * *

SIRS,—Would you kindly allow me to correct an error in my letter *re* "Cheap Plates," which appeared in the AMATEUR PHOTOGRAPHER of the 17th ult., showing a profit to the makers of 9s. per gross of half-plates. This is wrong. Taking the emulsion at 4s. per gross, as stated in my letter, to this must be added the price of the glass plates, say 11s. per gross, making the cost, for material only, 15s. per gross; then add labour and contingencies, 25 per cent. (not too much), 3s. 9d., making a total cost of 18s. 9d. per gross, instead of 13s. 6d., as stated by "A Country Cousin."—Apologising for the trouble I have caused, yours truly,

AULD REEKIE.

* * * *

HYDROQUINONE AND INTENSIFICATION.

SIRS,—If any of my comrades of the camera have under-exposed plates by the dozen, and under-developed them by the score in the early days of their novitiate, their experiences have been similar to mine, and I would suggest that if they set any store upon their sickly phantom pictures, they should treat them as follows: Bleach thoroughly for five minutes in a solution made up of $\frac{1}{4}$ oz. chloride of ammonium, $\frac{1}{4}$ oz. bichloride of

mercury, and 10 ozs. of water (Mr. Jerome Harrison's formula), and darken afterwards with a hydroquinone developer. They will be able to transform their nebulous negatives into brilliant pictures. For eighteen months I courted intensification, and tried as many processes. My most calamitous experience was with sulphite of soda as a darkening medium, and I should like to fine the author of the article in a contemporary which suggested it at least 40s., for my valuable negative—and it was really valuable to me, for I cannot replace it—was irremediably ruined, the image blackening up in one moment, and disappearing off the face of the plate and this earth the next. And it did this in spite of my watchfulness, as I knew the sulphite to be a strong reducing agent.

A ferrous-oxalate developer I found worked well, but the darkening was too gradual.

Ultimately I tried hydroquinone, with the result that I have resuscitated all my early sickly plates, and they are now as brilliant and rich in printing capacity as the most critical amateur could desire.

A. E. VENN.

* * * *

SLOW PLATES.

SIRS,—On page 52 of "Photo. News Almanac" for 1890 is an article by Captain Abney on "Gradation." He says: "In some plates I have seen twelve squares which differed in density; in others as many as eighteen. This means that light only sixteen times the intensity of the light which just gives a deposit, gives the greatest density on a plate, whilst in the other it means sixty-four times the intensity of light is necessary. As a matter of fact it will be found that the range of gradation in slow plates is inferior to that in the more rapid plates." Is the word inferior a misprint for superior? If not, why should slow plates always be recommended for copying and purposes in which great contrast and gradation are necessary? Your reply would be greatly valued.—Very truly yours,

FREDERICK BENTZ.

NOTE.—Perhaps Capt. Abney will reply.—Eds. A. P.

A LUTON SOCIETY.—By the kind invitation of Mr. and Mrs. A. Carruthers a meeting of amateur photographers was held at the "Bury," on Monday evening last, to consider the advisability of establishing a Photographic Society for Luton and district. It was unanimously resolved that a society be established, and that Cyril Flower, Esq., M.P., be asked to accept the presidency. Those present formed themselves into a committee to arrange for another meeting to be held at the Coffee Tavern, Cheapside, Luton, on Saturday next, February 8th, at 6.30 p.m., when they hope that all amateurs (ladies and gentlemen) of the town and neighbourhood will be present.

MR. EDISON'S LATEST INVENTION.—A telegram from Orange, New Jersey, to the *New York Herald* says:—"Edison has been developing his great idea of making use of photography as an adjunct to the phonograph in order to bring a speaker's personality before the eye. The result of Edison's experiments has been a wonderful machine. In front of the speaker are placed two small machines, one a phonograph and the other an ingenious piece of mechanism by which photographs of the speaker are taken in succession with enormous rapidity at intervals of from one-eighth to one-twentieth of a second, and both these machines are at work silently recording both the uttered speech and the personal appearance of the speaker at each fractional part of a second. The result thus obtained may be sent to any desired point, and the photographs thrown on a screen by an ingeniously contrived piece of mechanism. Thus the exact appearance of a speaker, with all his gestures and play of features, is exactly reproduced, while the phonograph simultaneously delivers the speech. The interval between the successive photographs is so infinitesimal that the screen picture is apparently a living one, moving, gesticulating, and apparently uttering the words which in fact are spoken by the phonograph. The greatest difficulty experienced by Edison in his experiments was the synchronisation of the two instruments, so that the utterances of the phonograph should exactly coincide with the gesticulations, but this was finally overcome, and the experiments were crowned with perfect success. What the commercial value of this invention may be is yet to be decided. It cannot fail to be intensely interesting as an exhibition feature, but whether it will fill a niche in the everyday life of the world is another question."

Winter Work.—XVIII.

By T. C. HEPWORTH, F.C.S.

ON FRAME-MAKING.

(Continued from page 71.)

OAK, like other wood, is porous and greedy of moisture of any kind. The first operation, therefore, is to give it a coating which shall act as a support for the gilding medium to be afterwards applied to it. Strong parchment size—which, like everything else required in this work, can be bought at the gilder's material shops—is the substance to use after it has been melted, with the addition of a little hot water. This size must be strained, and painted well into the wood with a hog-hair brush—the work being

done not too quickly, so as to avoid any frothing of the liquid. After being so treated, the frame is set aside to dry thoroughly, after which it will be improved by being rubbed down with the finest glass paper, and sized once more. Again the frame is dried, and now it is ready for the coat of medium which is to hold the gold-leaf to its surface.

This medium is known to the trade as oil gold size, and it is applied to the wood with a flat camel-hair brush. After this coating of gold-size, the frame must be set aside in a place quite free from dust for a period ranging from twelve to twenty

hours, the time being governed by the quality and age of the gold size, and also to some extent by the weather. For during this time the varnish-like fluid gradually evaporates, and it must be allowed to do so until it has reached just that point of "tackiness" when the gold will adhere to it best. When this point is reached, the gold-leaf—previously cut *en bloc* with a pair of

sketches in my catalogue, both of the pictures themselves, and also of their frames, in cases where the more ordinary patterns were departed from. These sketches I have reproduced here, and it will be seen that many of the designs are so simple that they can very readily be adopted by the amateur framemaker. In many cases I have shown how the beauty of the frame can be enhanced by preserving the grain of the wood, and this grain is far more noticeable if the wood be gilded than if it be left bare. There is certainly, in the case of oak, no choice between the two extremes—at least, in my humble opinion. Varnish, or polish, in any form is simply execrable, and if the wood be left entirely unprotected, it soon gets dark and grimy. In the case of a simple beading, this does not much matter, for a little rubbing with glass paper will soon give it a new surface; but if the frame be more ornate in character, this mode of treatment is not applicable.

Fig. 8 was remarkable for being made of rough dark-stained wood without gild-

ing. It enclosed a large picture of a cottage interior, and the subject was here again in accordance with the simplicity of the frame. Fig. 9 is an unusual kind of combination; the broad part of the frame being of dark wood bevelled back towards the wall, and the ornamental beading being made of metal, and having the appearance of oxydised silver. Fig. 10 exhibits another specimen of a pattern in gilded oak with a carved ornament near its outer edge. An effective pattern for a wholly gilt frame is seen at fig. 11; and No. 12 is a gilt oak frame with raised diamonds upon it. This frame

is more eccentric than effective, and as it had no possible reference to the subject of the picture, seemed to be meaningless in design. Fig. 13 is a frame made of deal and stretched with coarse canvas, which is afterwards coated with glue and gilded as already described. Figs. 14 and 15 are both plain oak frames with hollowed out panels.

These I copied from pictures in the Grosvenor Gallery, and they were certainly effective. They could be made by building up pieces of oak, by any one having a slight knowledge of the use of tools.

In frame-making we must guard against over-elaboration, and must constantly remember that, after all, the work must be subservient to the picture which it is destined to contain. This over-elaboration was the fashion in days gone by, so much so that it was not uncommon to hear an ignorant critic make remarks about the beauty of the frame, and paying very scant

(12.)

(13.)

(11.)

scissors to the best size to suit the moulding to be covered—is pressed on bit by bit, each piece overlaying the edge of the other until the entire surface is covered. Now let the frame rest for a few more hours, and lightly dust off the superfluous gold with a clean dry cloth. The operation is concluded by giving the gilded surface a coating of *clear* parchment size, which protects the delicate surface from all attacks of contaminated air, etc.

At a recent exhibition in London, I was interested in noticing the new styles of frames which many of the artists had adopted, and I amused myself by making thumb-nail

attention to the picture itself. As we have already seen, there is a tendency now-a-days to go to the opposite extreme, and to frame a picture with such ostentatious simplicity that the verge of eccentricity is continually reached.

(14.)

Many amateur carpenters are very skilful in fretwork, and useful treadle machines are now sold at a low price, which execute the work with ease and rapidity. Fretwork can be introduced as an adjunct to ordinary frames, and is effective if well done. But I think that it should only be used for portraits, and in imitation of those handsome Italian curved openwork frames which have long been in use for oil paintings. The best way to employ fretwork is as an appendage to an ordinary mitred narrow frame, which should have on its outer edge a rebate cut so that the fretwork ornament can be sunk therein, and so brought flush with the original moulding. The design should be bold in outline, and unlike in character to the fine work which used to be commonly employed for the front of a piano. It should be of such a nature too that the mitred corners will come well together, and not give the idea of a break in the pattern where the join occurs. Perhaps on the whole it is better to use fretwork for little fancy portrait-frames, which are supported easel-fashion on the drawing-room table, and stand among other knickknacks of a similar character. Under the same category come frames which are covered with coloured plush. These are easy enough to make, for they can be cut out of soft pine, and any little irregularity which may be at first apparent is covered up and hidden by the plush. The best cement to use in order to make the material adhere to the wood is a mixture of flour-paste and glue, the former correcting the brittleness of the latter. If glue be used alone the contraction of the plush has a tendency to strip it from its support.

(15.)

THE HUMAN FACE.—Sarony, the well-known photographer of New York, referring to the fact that, in the majority of human beings, one side of the face is very much unlike the other, attributes the principal cause of this to the habit of sucking the thumb in childhood. When baby's chubby little thumb is in his mouth, the forefinger presses the cartilages of the nose on one side, and by degrees completely out of shape. Some time ago, a lady took her two daughters, both of whom were in their teens, to be photographed. Sarony at once noticed that while the elder girl had almost perfect features, the younger one's nose was depressed on one side, and the lips protruded so much that they showed the teeth. The photographer guessed the cause, but determined to verify his conjecture, and so diplomatically conducted the conversation as shortly to elicit the fact that the younger sitter had been in the habit of persistently sucking her thumb until she was three years old. Sarony, in relating this incident, declares that there would be many more symmetrical features in the world if mothers would put a stop to thumb-sucking in childhood.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER III.

The Dark-Room.

PHOTOGRAPHER.—You are now no longer an angler, but a pupil, and as such I will address you. We will begin at the bed rock, and work upwards. One of the soundest foundations for success in photography is the possession of a good dark-room. It should be roomy, convenient, well appointed, and, if possible, away from the house. I would call it the laboratory, but that sounds too pretentious and scientific for a place where the study of science is not intended. If you want to go in for severe science, you should set up a separate establishment on another part of the premises, for the two pursuits do not accord together. The perfumes of science do not always agree with dry-plate delicacies. A gelatine plate in the presence of some of the emanations of science becomes naturalistic at once, and fogs.

PUPIL.—Then a proper dark-room is as necessary as a camera?

PHOTOGRAPHER.—Quite. It puzzles me now how so many manage to develop in a closet or cupboard, with a basin for a sink and a jug for a tank, although I have had considerable experience in awkward corners. Changing plates, which is about all that a practised photographer finds necessary now, away from home, is bad enough, but it is nothing to the inconveniences we used to experience with wet plates.

PUPIL.—Like Punch's footman who asked, "What are taxes?" I should feel inclined, if I had not confessed to some knowledge of photography, to innocently ask, "What are, or were, wet plates, and how are they used?"

PHOTOGRAPHER.—You may do so without displaying any very great ignorance, for the collodion process is almost completely forgotten, and is seldom used except in what may be called the industrial processes. It is still used for enlarging and for the production of printing blocks, and also in some of the vitreous enamel processes. But to return to dark-rooms. I have developed large plates in a coal-hole, but the most awkward experiences I have had have been in a state-room of a yacht in a gale of wind. It was difficult enough during fair weather; even then the lantern and slides would vanish with a clatter into the dark. And when all the light is shut out of a cabin the ventilation suffers and the thermometer rushes up to extraordinary heights. It is better to avoid these gymnastics, and do all you can at home in your own comfortable dark-room.

PUPIL.—How do you manage when you are absent from home for some weeks? In a book I read to-day I see it is insisted on as a strict rule that plates should be developed "never later than the day on which they are taken."

PHOTOGRAPHER.—This strict rule is the strictest pedantry, and could not have been written by anyone who had much real knowledge of the art. It would, of course, be of advantage to know that you have got a good negative while you are on the spot, but you may to a great extent insure this, when the subject is worth it, by exposing a duplicate. Then the chances are that in the difficulties of developing away from home negatives may be spoiled, and certainly you would not be able to give their treatment the calm consideration every plate deserves. Then again it is well to have your subject in your mind when you develop

but your memory ought to be good enough to bring back the peculiarities of the subject the moment it begins to appear under the developer, and give you time to consider the treatment. The sort of remark you quote is usually given to show how very particular and precise the author is, but I prefer the common-sense of photography, and knowing that a gelatine plate will keep perfectly for months, and being also a pretty good judge of light, as every photographer should be, I never develop away from home. I should mention, however, that I always take the precaution to make two exposures on good subjects or if there is a chance of a figure having moved. Then I cannot imagine anything more delightful than shutting yourself up in a well-ventilated, well-appointed dark-room, with some dozens of exposed plates, shuffled like a pack of cards so that you do not know what is coming next. This is a confession I did not mean to make, for it is a most pernicious practice which I hope you will not imitate, but I cannot deny myself the delights of surprise, although I sometimes have a scuffle to save a negative I should have begun to develop better if I had known the subject and learnt all about it from my note-book. So that until you have had great experience I must insist on your putting a number on the back of each plate and making full notes of the exposure, the subject, and other particulars made on the spot.

PUPIL.—And the dark-room?

PHOTOGRAPHER.—You do well to remind me of my subject occasionally. As I think I have said, keep the dark-room clear of the house if possible. Here is mine, as you see, built at the bottom of the garden. It was originally built of nothing but Willesden paper. I had had it up for four years, and noticed no signs of wearing. It was really waterproof and very strong. I have seen six inches of snow on the roof for several days, but in June last we had an extraordinary storm of ice, some pieces of which measured $2\frac{1}{2}$ inches in diameter. The paper was apparently unhurt, but a month or two afterwards it leaked, and examination showed that the sharp-pointed lumps of ice had broken the surface, so I had the place covered with corrugated iron. The paper makes a capital lining. It is a shed, as you will see, 14 ft. long, 12 ft. wide, and 6 ft. 6 ins. to the eaves, with a gable roof. The space is divided into two rooms; the first which we enter is used partly as a carpenter's shop and partly as a printing room, the inner one is the dark-room. This arrangement gives us the opportunity of having two doors between the light outside and the one that must be actinically dark—an arrangement that has many advantages. The window at the narrow end of the room, facing north, is 2 ft. square, for I like plenty of light of the right quality, containing white glass; when I want to change plates or develop, I slide this frame, which runs in grooves, and is glazed with ruby glass over which is tacked a piece of canary yellow calico, and this gives me a good safe illumination on ordinary occasions; but if I want to use Isochromatic plates, or if the sun shines on the window, I draw this other slide, which also runs in grooves, and contains another sheet of ruby glass. You should also be provided with a lantern for night work. Some photographers prefer to work entirely by artificial light, because it is more constant than daylight, but I see no advantage in it, and it is certainly more trouble to one who only uses his room occasionally. Under the window is a Doulton's sink. These sinks are a vast improvement on the wooden lead-lined or pitched sinks formerly in use. Indeed, I cannot imagine anything more perfect. The water and gas are laid on from the house. On each side of the sink is a bench table 20 ins. wide, filling with the sink that end of the room. The bench is also continued at the same height round the room, with the exception of the door space and south end.

Under the bench to the left of the sink is a rack for dishes ranging from 26 by 20 downwards. For the larger sizes I use composition; for the smaller, ebonite and porcelain, but there is a dish called granitine which is superseding porcelain. It is a golden rule to appropriate one dish to one purpose only, and to paint the use for which it is employed on the bottom of each. Hyposulphite of soda is never allowed to enter the dark-room, but is used when required in the outer room. In the south corner is a cupboard used for storing solutions which are better kept in the dark, such as gold toning solutions and those used for developing platinotype prints, also another for the stock of chemicals. In every available place there is a shelf.

PUPIL.—It is packed like the cabin of a ship.

PHOTOGRAPHER.—Yet I try to keep it as clear as possible, and everything not in actual use packed away in its place. There is nothing more obstructive than muddle, dirt, and confusion. Besides the large window, there is another on the east side, high up, for ventilation, and a ventilator in the floor. It will not be necessary to mention here the minor details of the contents of the dark-room; we shall come to them as we use them by and by. Outside the shed are fixed several stagings made of battens; these are very useful for holding printing frames, dishes, or anything for which out-door tables may be required. I have not called much attention to the contents of the outer room, as they are not strictly photographic, but you would find the carpenter's bench very useful, not only for its legitimate use, but as a printing table. Every photographer at times must do a bit of carpentering, and should possess a tool box and bench. You will notice that the hypo and its dishes are kept out here, and that the roof affords ample accommodation for packing cases. This room to the right, 12 ft. square and partly roofed with glass, is just added. It is very useful for printing in bad weather, and I find the extra space adds greatly to comfort. You must have had enough of the dark-room. Our next discourse shall be in the light.

(To be continued.)

A LOST COLOUR DISCOVERED.—Artists and scientific men have long wondered about the beautiful "azzurrino" found in the ruins of Pompeii. M. Fouque, the mineralogist, with a mixture of silicate of copper and of lime, has now obtained the brilliant crystalline "azure" of Pompeii. It is a tint perfectly unchangeable, and identical with the Alexandrian blue which was known to the Ptolemies, and imported into Italy in the first years of the Christian era.

ULSTER AMATEUR PHOT. SOC.—We have just received a copy of the report and accounts of the above Society, and are glad to find that the year's work shows a good record. We may mention among many contributions that have been given, the following:—Opening discussion on "The Development of Lantern Slides," by the President (Professor Letts, Ph.D., F.R.S., F.C.S.); "Notes on a Tour in Norway," with lantern illustrations, by Mr. J. Stelfox; "Photo-Gleanings at the British Association Meeting," by Mr. J. Brown; "A Photo-Cycling Tour in Norway," with lantern illustrations, by Mr. W. Swanston, F.G.S. The Hon. Secretary, Dr. Cecil Shaw, M.A., 14, College Square, East Belfast, will be glad to hear from any gentlemen desirous of joining the Society.

MR. W. JEROME HARRISON, F.G.S., the Science Demonstrator of the Birmingham School Board, has just received intimation from the Secretary of the Geological Society that the Council have awarded him the proceeds of the "Barlow-Jameson Fund," in recognition of his "valuable contributions to geological science," and he is invited to attend the anniversary meeting of the society on 21st February next to receive the award. The former recipients of the "Barlow-Jameson Fund" were—in 1882, Dr. James Croll; 1884, Baron von Ettingshausen; 1886, Professor Leo Lesquereux; and in 1888, Dr. Johnston-Lavis. The income of the fund is "to be applied every two or three years, as may be approved by the Council, to or for the advancement of geological science."

Rambling Papers.—IX.

BY W. K. BURTON.

ENAMELLED PRINTS.

FROM the consideration of matt-surface prints it is not unnatural to pass over to a consideration of prints having a surface as much different from the "matt" surface as is possible. By enamelled, I do not here mean merely burnished or treated with what is known as "encaustic paste;" I refer only to prints that have the extremely high gloss that is due to stripping from a surface of glass. They have, in fact, a surface that is the exact counterpart of a surface of glass and that may be said to be the same. These prints are generally incontinently condemned by people who have, or pretend to have, artistic taste, yet they remain favourites with a great many, and there can be no doubt whatever that they have a certain sort of beauty of their own. It may be beauty of a low or vulgar type, but it is beauty nevertheless. I do not, however, intend to enter into the question of the merits or the demerits of enamelled prints for pictorial purposes. It is a question concerning which different persons will hold different opinions, whatever I were to say on the matter, who am by no means qualified to speak with authority. It is of a purely technical use of enamelled prints—a use not, I believe, as generally known as it should be—that I propose to speak a little.

All who have tried copying an ordinary print, of pretty well any kind, will know how difficult it is to get even a fairly good copy, and how still more difficult it is to make a good enlargement. There are two causes of failure; one is the tendency that there is to the reproduction of the grain of the paper in a very pronounced degree, the other is the loss of half-tone, and the tendency to run into a photograph with nothing intermediate between pure whites and deep blacks.

It is probable that the majority of your readers have never had occasion to copy, or enlarge from, an enamelled print; but those who have, and who understand the principles of lighting prints to be copied, must have noticed how much better results they got than when copying any other kinds of prints. In the first place, on account of the glazed surface, there is no tendency to reproduction of the grain; in the second place—for what reason I am unable to say—there is less tendency to loss of half-tone.

All this must, I say, have been observed by any one who has had even a little experience in the copying of enamelled prints, but my friend K. Ogawa was, I believe, the first to use enamelled prints in preference to transparencies as a means of reproducing negatives, and of making enlarged negatives.

All are aware, I suppose, that the most common way of making reproduced negatives is to make a transparency from the negative to be reproduced, and to make a negative from this again; and that the way in which enlarged negatives are made is to make a transparency first (either of the size of the original negative, or of the desired enlarged negative, in the first case by contact, in the second case in the camera), and to make an enlarged negative from this. Now Ogawa found that he could get actually *better* results by copying or enlarging an enamelled print, than by making a transparency first, and it need scarcely be said that both the trouble and the expense are less.

In copying prints on albumenised paper—the commonest kind of print that has to be copied—there are two things that must be guarded against, even to get a tolerable negative. One is reflection from the glaze of the surface, the other is the shadows cast by the minute elevations of the

grain of the paper. Reflection is readily overcome by lighting from the side, but lighting from *one* side only strengthens the shadows just mentioned and, consequently, the grain. The theoretically perfect lighting for copying such a print is all side light, but comes not from one side only, but equally from all sides, and in practice it is necessary to get a lighting as closely approaching this as possible.

In copying enamelled prints there is only one thing to contend against, and that is the reflection, a thing that can, as I have just said, be guarded against by merely lighting from the side. In fact, it is only necessary to place the print and the camera in such positions that, looking from the camera, no reflection is visible from the surface of the print.

I imagine that a print enamelled by any process might be used, but Ogawa makes prints on gelatino-citro-chloride paper specially for the purpose of reproducing negatives or of making enlarged negatives. It might be supposed that the tone of the print would have a great effect on the quality of the negative got from it. It is not, however, found in practice that this is the case; but Ogawa, on the whole, prefers a brownish tone.

It has often been recommended in the photographic journals that a photographer, whether amateur or professional, should always make a transparency from any negative that he specially valued, so that, in case of its destruction, he might be able to reproduce it. Now the practice of the photographer whom I have mentioned above, is just as good as this, and is more simple. He makes a print on gelatino-citro-chloride paper, and stores that. It is not even necessary to enamel it at the time. In fact, it is probably better not to do so, as the delicate enamel surface is liable to injury. If at any time the original negative gets broken, or for any other reason he wishes to make a second negative either of the same size or larger, he can take the print, and enamel it by preparing a plate of glass, wetting the print, squeegeeing the print on it, drying and stripping.

The actual operation of enamelling a print is described in almost every hand-book of photography, and it would be a waste of space to re-describe it here. A hint on the only part of the process that is likely to be troublesome may, however, not be out of place. I imagine that most who attempt to produce enamelled prints, if they fail at all, fail on account of the adhesion of the print to the glass. I used to have many failures from this myself, but I completely overcame them by a slight modification of the way of preparing the glass. What I advise is as follows:

The glass should first be thoroughly cleaned, and should be covered with a thin coating of wax by rubbing over it, with a piece of flannel, a solution of a few grains of bees'-wax to each ounce of benzine. Some French chalk should then be scattered on the surface, and with this and a clean piece of flannel the wax should be polished off as completely as possible. It will be found after this that there will be no sticking of the prints to the glass.

(To be continued.)

AN OPTICAL LANTERN SOCIETY.—A largely attended meeting of gentlemen interested in the optical lantern was held at the Lawson Café, West Bar, Sheffield, on Wednesday evening, Jan. 29th, when it was unanimously resolved that an association be formed under the title of the Sheffield and District Optical Lantern Society. The object of the Society is the periodical exhibition of members' own work, and also for the interchange of ideas on the subject. In addition to a committee of management, the following officers were elected:—President, Dr. Manton, M.R.C.S., L.R.C.P.; Vice-Presidents, Mr. J. C. Skinner and Mr. H. Staniforth; Hon. Secretary, Mr. J. S. Frith, 403, Shoreham Street, Sheffield. The first general meeting will be held on Wednesday, February 12th.

Our Contemporaries at Home and Abroad.

Anthony's Photographic Bulletin (N.Y.) says:—"Judge Rea, of Minneapolis, recently rendered a decision that is of importance to photographers. Miss Ida E. Moore brought suit against A. B. Rugg for allowing a private detective named Clark to obtain a picture of her from his studio. Rugg entered a demurrer, charging insufficient cause for action. Judge Rea overruled the demurrer on the ground that a photographer has no right to allow anyone, other than the person who sits for a picture, to take photographs from his gallery." In an article on "The Influence of Temperature of Photographic Manipulations," it says:—"The assertion that more detail could be obtained from a warm than a cold developer is erroneous; the developer applied warm accelerates only the development of the shadows—that is, the negative remains soft, and will therefore furnish harmonious and handsome prints." Articles: "The New Printing Process," "General Remarks on Developers," "Testing the Rapidity of Dry Plates," "False Rendering of Photographic Images by the Misapplication of Lenses," etc.

L'Amateur Photographe (Paris) continues its article on "Photography and its Industrial Applications," and there are also articles on "Toning with Uranium," "A Fixing and Toning Bath," "The Lantern for Enlargements," etc.

American Journal of Photography (Phila.), in an article on "The Dangers of Flashlight Compounds," says:—"It seems hardly necessary now, in view of all that has been said, to raise a note of warning in regard to the use of all these flash-powders, but the statement has been already made that while this one particular compound was unsafe, other compounds are harmless. The writers wish to state, therefore, that they consider *all forms* of flash-powder dangerous, the difference between them being only in the degree of danger involved." Articles: "Stops or Diaphragms," "Value of Silver Waste," "A Dream of Photographic Perfection," "Darkened Silver Chloride not an Oxychloride," etc.

The *Art Journal* for February contains as a frontispiece a splendid etching, by James Dobie, of Frank Bramley's pathetic picture "A Hopeless Dawn," and the articles, of which we append a list, are most interesting and copiously illustrated. Articles: "Vanishing Rome," "Painters' Studios," "The Royal Academy in the Last Century," "Church Furnishing and Decoration," "Cambridge as a Sketching Ground," and portraits of Robert and Elizabeth Barrett Browning.

The Beacon (Chicago), speaking on "Mounting Lantern Slides," says:—"But we may ask, Why should lantern pictures be square, or nearly so? Artists of the brush are deservedly credited with a fairly good appreciative taste in such matters, and we are within the mark in saying that less than one per cent. of the frames that adorn our galleries, either public or private, are of that form, and even of those few, for most of them there is some especial reason for the choice of the direct square. . . . No pains should be spared, and no time grudged or thought misspent, and an exposure should never be made on a subject that is not in every way satisfactory. Better a clean plate than a picture that needs to be apologised for." Articles: "The Optical Lantern" (continued) "Printing on Plain Paper," "Carbon Printing," "Toning Ready Sensitized Paper," "Flashlight Photography," "Copying Processes," etc.

British Journal of Photography, speaking of "Emanations from the Dark Slide" and their causes, says:—"It would be desirable to know more definitely than we do at present what are the substances that produce the emanations given off from either fogging or insensitiveness in our sensitive films—turpentine and some kinds of leather have an evil reputation, but the list of substances, the emanations from which produce some effect upon gelatino-bromide of silver is, no doubt, capable of being considerably extended, and a systematic research of the nature of such substances and the characteristics—whether fogging, desensitizing, or possibly of enhancing sensitiveness—belonging to each, would be a valuable addition to the stock of photographic knowledge." Articles: "Fatal Bursting of an Oxygen Cylinder," "The New Benzoline Limelight," "Selecting Focal Distance with Detective Camera," "Distance beyond which all Objects will be in Focus with any given Lens," etc.

Bulletin de la Société Française de Photographie contains a list

of the members of the Society, and the report of the general meeting of the members on January 3rd, in the course of which the Secretary emphasised the danger in the use of flash-light powders. Dr. Stolze recommended that the magnesium should be mixed with only an equal quantity of chlorate or nitrate of potash. There was also a communication on the "Development by Eikonogen."

The Camera contains articles on "Lantern Slides," "Detective Photography," "Repairing Broken Negatives," "Eikonogen," etc.

Illustrations for February is an interesting number, with many illustrations. It contains articles on "The Berberis," "Yankee Ingenuity," "Aelfgyth, the Cornish Slave Girl," "Cecil Gordon Lawson," "Tyrolean Winter Resorts," "Bacon versus Shakespeare," "The Land of the Maoris," and "By the Stream-side."

The *Journal of the Society of Arts*, speaking of "The relation of the Fine Arts to the Applied Arts," says:—"The exquisite proportion of perfect form and the superadded charm of harmonious colouring combine to produce beauty in design, and the true principles underlying each are not beyond acquisition, although it may still be true that 'a poet is born, not made.'"

The Naturalists' Record has an article on "Hints on Photography for Naturalists," by Dr. Emerson, and, in another article on "Photography" generally, it says:—"As we have before advised, learn to retouch, but don't do too much of this sort of thing. The tendency now-a-days is to make a thing look better than it really is. There beauty is lost. Keats says, 'Beauty is truth—truth beauty.'"

Photographic Answers (No. 3) contains a reproduction, by the Direct Photo Engraving Company, of Mr. Willard in "The Middleman." In its article "Practical Work," dealing with the production of lantern slides, it says:—"The first essential for a perfect lantern slide is correct density, and, as a guide to this, we strongly recommend the purchase of a good slide from some dealer, with which to compare those we make for ourselves. There should be no difficulty in obtaining such, but the slide must be made on a gelatine plate if we are going to use gelatine dry plates." It also treats of the carbon and transferotype processes, colouring slides, and to make slides from larger negatives. Other articles are: "The Order of the Day," "On Platinotyping," "Suggested New Developers," "On Negative Retouching," "Eikonogen," etc.

The *Photographic Art Journal* contains two process block reproductions—Netley Abbey and "Broadlands"—which are a great step in advance of those presented with the last number. In an article on "The Artists' Purpose," it says:—"Surely there never was a greater mistake than the custom which puts the camera on the top shelf from October until May—as though Nature were not worth looking at all through the winter—unless it be for an occasional fall of snow unusually long, and lying deep, or a phenomenal hoar frost! Cover-side and wood, and even damp open meadows, are made beautiful on the least interesting of winter days, if the light and time of day be but rightly chosen. Is there no picture to be found in the silent, dim, misty days of a damp February?" Articles: "The Authority of Painters," "Topography and Art," "Copying," "Lyonel Clark's Platinum Toning Process," etc.

The *Photographic News*, speaking of "Magnesium Lamps," says:—"When magnesium ribbon was first made it was rotten, and broke easily when handled; this defect was overcome by alloying it with a trifling proportion of zinc. As zinc gives a bluish-white light when burnt, it might be worth while to try experiments for the production of a large and brief flame of burning zinc at will, to find out what can and what cannot be done with it in photography." Articles: "Obtaining the Critical Focus upon Finely-Ground Glass Screens," "Eikonogen," "Selecting Focal Distance with the Detective Camera," etc.

Photographic Scraps says:—"Pictures by photography, when indicating motion or expression, will only be perfect when we can take three or four successive 'shots' at our object, and combine them in the zoetrope adaptation of the lantern. Then we shall get a picture which shall approximate somewhat to that which the eye is conscious of in the ordinary way—a picture which is as far removed from that libel usually known as an instantaneous photograph as light is from dark."

Photography, speaking of "Exposure," says:—"The usual habit is to try with how little exposure we can get detail. The proper

way rather is, to try how much we can expose our plate without fogging the negative." Articles:—"In the days of Wedgwood," Mr. Muybridge on "Animal Locomotion," etc.

The Practical Photographer, speaking of "Fire Insurance for Photographers," says:—"The insurance offices do not care to reduce their rates as the risks reduce, unless pressure is brought to bear from outside, and in this inaction they simply follow the ordinary rules of business. Photographers, in a very great number of cases, are paying rates far beyond what the risks warrant, simply because they are too indifferent to take action to secure fair treatment." Articles: "Photography as a Business," "Photographic Travellers: F. K. Hurman," "Position and Prospects of the P.B.A.," "Aluminium for Lens Mounts," "Electric Light in Portraiture," etc.

The Scientific American describes Mr. J. H. Biggs' method of making silver prints on rough drawing paper, and it also describes a photograph of the Pleiades taken at the Leek Observatory. The plate measured 8x10, and Mr. Barnard estimated that there were on it distinctly visible 64,000 stars.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

MR. LYONEL CLARK occupied the chair at the meeting of the members on the 30th, when, however, the attendance was rather small. Previous to the business of the evening, Mr. Davison showed some prints, by Mr. Quick, which had been made on a portion of the same paper as a letter was written on, which that gentleman had salted and sensitised with a strong citro-nitrate bath. The effect was good, and the colour soft. Mr. Davison also announced that on Monday another exhibition would be opened at the Club, which would be followed by the monthly smoking concert.

Mr. Dallmeyer then read his paper on "Some Deductions from the Law of Conjugate Foci." The paper was interesting, but as it consisted mainly of descriptions of apparatus and the explanation of some specimens attached to cameras which the reader had brought with him, it is somewhat difficult to go into it. One thing must have struck Mr. Dallmeyer's hearers, viz., that, however effective the apparatus he described, it was somewhat complicated, and we are afraid that until some simpler method of doing away with the focussing screen is discovered, most photographers will prefer to retain it. Subsequently to the reading of the paper, the conversation drifted into the question of enlargements, and one gentleman related the fact that a person of his acquaintance who had done very successful enlargements, reduced the picture first, and then enlarged from the reduction! Another one desiring to enlarge four diameters, made a negative two diameters larger than the original, and then enlarged again from that. The Chairman intimated that for the best work he had found it well to enlarge to, say, five diameters, and from that enlargement to reduce to four. The proceedings terminated with a vote of thanks to Mr. Dallmeyer for his paper.

The subject on Thursday, February 13th, is "Landscape," when a paper will be read by Mr. Graham Balfour.

THE *Oxford Magazine* of January 29th, in referring to an etching by Mr. Claude de Neuville, says that the "Magdalen Tower is deservedly the best known bit of Oxford; it is the favourite of artists of all kinds, whether painters, etchers, or photographers." We quite agree with this, and hope Mr. de Neuville may succeed in giving us something out of the common. His pen-and-ink drawings of Oxford are, if anything, too careful and affected, but nevertheless dainty and refined.

LIPPINCOTT'S for February is very interesting, the *pièce de résistance* being a story by A. Conan Doyle, "The Sign of the Four." There is also an article by Francis Galton, on "Why do we Measure Mankind?" and another by A. E. Watrous, City Editor of the *Philadelphia Press*, on "The Newspaper and the Individual: a Plea for Press Censorship," in which the question is dealt with boldly, but the idea is one which will not be received in England without opposition.

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BATH PHOT. SOC.—On the 29th ult. a meeting was held, at which Mr. W. Pumphrey (President), Messrs. Lewis, Wells, Swain, and Gibbs were elected members of the Society, and Messrs. Pitman and Day, Auditors. An offer by Dr. Emerson to present the Society with a copy of his work, "East Anglian Life," was accepted with best thanks. Messrs. Dugdale and Davis then entertained the company with dissolving views of places visited by the Society at the summer outing, also a local series and one of North Devon. Mr. Davis manipulated the lantern (his own), using an oxy-etho tank of own make. The light was very steady and brilliant. Mr. Dutton showed some trials of bromide printing on celluloid, and some others on opal and cardboard. Annual meeting, February 26th.

BRIXTON AND CLAPHAM CAMERA CLUB.—The last meeting was held at the club-rooms, 35, Bedford Road, Clapham, S.W., on Friday, 31st ult. Five proposals for membership were received. Articles from the journals and PHOTOGRAPHIC QUARTERLY were read, and a discussion on the subject of "Exposure" took place. Amateurs in the neighbourhood are invited to the meetings.

DUKINFIELD PHOT. SOC.—The ordinary monthly meeting of this society was held on the 31st ultimo; the President, Mr. John T. Lees, in the chair. The arrangements for an exhibition of members' work, to be held on February 20th, 21st, and 22nd, were announced. On the first night members' slides are to be exhibited; on the second night a number of commercial slides; and on the third night a soirée will be held. Mr. T. Glazebrook (Vice-President) then gave a very successful demonstration on the "Cold Platinotype Process." The President followed with a demonstration on "Bromide Printing by Contact," from the same negatives that had been used for the platinotypes. The Secretary presented to the Society (on behalf of Mr. Richard Keene, of Derby) two beautiful platinotypes, and a hearty vote of thanks was passed to Mr. Keene for his kindness in presenting them. A vote of thanks to the demonstrators concluded the proceedings.

EDINBURGH PHOT. SOC.—The first popular meeting of the Edinburgh Photographic Society for this session was held on January 30th, in the Queen Street Hall. There was a large attendance, and the entertainment appeared to be much appreciated. About 140 transparencies were shown on the screen, mostly illustrating Scottish scenery or folk-scenes, and the descriptive remarks were read by the Secretary, Mr. T. Barclay. The proceedings were pleasingly varied by songs sung by Miss Edmonds, Miss Smith, and Mr. D. Macarthur.

HOLBORN CAMERA CLUB.—On the evening of the 31st ult., there was no formal meeting, but several members attended for a social evening at the Club-room. Mr. Chang and Mr. Cobb submitted proofs of the flash-light pictures taken on the occasion of the recent visit of the club to the rooms of the Holborn Cycling Club, which were much admired. Mr. Dear submitted to the notice of the members an album of views taken by a friend in New Mexico. Two energetic members of the club who had been giving an entertainment in the City with the club lantern and screen then turned up, and were received with acclamation. During the evening a magnificent 22 by 16 enlargement from a negative of the club head-quarters, taken by Mr. Brocas, arrived from Messrs. Fry and Co. The members will be pleased to see visitors this evening (February 7th), when the subject will be "Instruction to Beginners," including "How to Select a Camera and Lens, and How to Use them to the best Advantage."

LEITH AM. PHOT. ASSOC.—The annual general meeting of this Association was held in the Rooms, Duke Street, on 28th January, Mr. W. F. Walker, Vice-President, occupying the chair. The Secretary submitted a report relative to the progress made by the Association during the short term of its existence, which showed that exhaustive papers, dealing both with the art and science of photography, had been read; various novelties apper-

taining to the art had been before their notice, through the kindness of patentees and others; selections of work by eminent photographers had been submitted them for inspection; and gifts of a more or less valuable nature had been made to the Association. The membership stood at forty-eight ordinary and two honorary members. The report was unanimously adopted. The election of office-bearers for the session 1890 was then proceeded, with the following result:—President, Mr. William Dougall; Vice-President, Mr. Thomas W. Dewar; Treasurer, Mr. Alexander Pitkethly; Secretary, Mr. A. D. Guthrie; Members of Council, Messrs. Wm. Smith, John Pourie, R. C. Ewart, Robert Hunter, Campbell Hossack, W. F. Walker, Wm. Swanston, M. Campbell, Thos. Wilson; Auditors, Messrs. Hunter and Ewart. A discussion followed on a proposed second popular meeting, it being finally agreed that a lime-light exhibition of members' work should take place in Junction Street Hall on Tuesday, 25th February, the arrangement of details to be left in the hands of the Council. Mr. R. Hensleigh-Walter was admitted a member, while Dr. McCreadie was nominated for admission. An offer from Dr. P. H. Emerson, author of "Naturalistic Photography," to present the Society with a copy of his "East Anglian Life," fully illustrated by reproductions of his pictures, was accepted. A design for the membership card for 1890 by Mr. Wm. Smith was submitted and unanimously accepted.

LIVERPOOL AM: PHOT: ASSOC:—The first ordinary meeting of the twenty-seventh session was held on Thursday, the 30th Jan. The President, Mr. Paul Lange, occupied the chair. The minutes of the previous meeting were read and confirmed. A letter was read from Mr. A. W. Beer (ex-President), regretting his inability to attend, owing to illness. In his absence, Mr. B. J. Sayce occupied the chair at the commencement of the proceedings, and in a few words introduced Mr. Paul Lange, President-elect, who thereupon took the chair. The following gentlemen were elected members of the Association, viz.: Messrs. J. W. Warburton, M.D., Jno. Price, M.I.C.E., Rev. G. F. Wills, H. Cope West, E. S. Gladstone, B. Cookson, and J. Watkins. Mr. P. Lange spoke at some considerable length as to the benefits derived from conventions generally, more particularly when attention was drawn to something really practical. He advocated that a better feeling should be cultivated with kindred societies, and drew attention to the Chester Conference to be held shortly, of which Mr. F. Evans was the able Secretary. Mr. Lange had not had time at his disposal to prepare anything in the form of a "speech," and called attention to the general plan of operations which it was proposed to carry out during the session, and hoped the members would not be reticent about photographic troubles and failures (especially the younger members) which they might experience from time to time. He was sure there were many experienced members who would be most happy to give the necessary information. A short discussion on the subject of "The Best Lenses for Detective Work" then followed, in which Messrs. Sayce, Wilkinson, Earp, Lange, Kirkby, Williams, Tomkinson and Swinden took part. It was pretty generally allowed that an ordinary French lens, working at $f/11$, with a rapid shutter, gave good results; especially so when working with a lens covering the next larger sized plate than the one used (i.e., a 5 by 4 lens for quarter-plate prints, etc.) Arrangements had been made for Mr. A. W. Beer's paper entitled "Bits on the Borders and Rambles on the Marshes," but as this could not be given owing to Mr. Beer's illness, Mr. W. J. Archer exhibited a selection of Woodbury lantern slides and a series of views of the Paris Exhibition, including a few panoramic slides, which gave great satisfaction. The exhibits consisted of snap shots by H. Wilkinson on glass and film; new lantern slide carrier by W. J. Chadwick, Manchester; and Mawson and Swan's transparency and photograph frame.

MANCHESTER AM: PHOT: SOC:—The fifth annual meeting of the Manchester Amateur Photographic Society was held in the Athenæum on the 28th January. Some valuable additions were made to the rules, after which the ballot papers were distributed for the election of the Council for 1890:—Messrs. Boardley, Bond, Briggs, and Shaw were appointed scrutineers, and during the counting of the votes there was a sale by auction of surplus apparatus, the property of members of the society. The poll was an exceptionally heavy one, and the result was only announced at a late hour. The elected Council then retired and elected from their own number the officers for 1890. The list is as follows:—President, Mr. J. Davenport; Vice-Presidents, the Rev. H. J. Palmer, M.A., and Messrs. H. Smith, J. W. Wade, and J. Whit-

ham; Treasurer, Mr. J. G. Jones; Librarian, Mr. J. H. Seed; Editor of Magazine, Mr. George Wheeler; Hon. Secretary, Mr. R. O. Gilmore; General Council, Dr. Tatham and Messrs. Bathe, Dawson, Flower, Parrott, Rigby, Stanley, Stevenson, and Wilcock. This Society is now the largest of the kind in the United Kingdom.

NORTH MIDDLESEX PHOT: CLUB:—The following gentlemen have been elected officers for the ensuing year. Honorary officers—President, J. Humphries, F.S.A.; Vice-Presidents, H. Beckett, W. T. Goodhew; Curator, F. Davall; Council, C. Beadle, F. Cherry, T. C. Lathbridge, W. A. Lavanchy, F. L. Pither, J. Saville, J. Steuart, H. Walker, E. T. Hiscock; Treasurer, E. Seymour Paul; Hon. Secretary, George R. Martin. On Monday, January 27th, Mr. L. Medland gave an interesting lecture, entitled "In Northern Latitudes with a Camera," illustrated by lantern slides shown through the optical lantern; the slides were collodio-bromide, made by himself from negatives taken during his tour. A very interesting evening was spent. The following gentlemen have been elected honorary members: Messrs. S. Herbert Fry, Charles W. Hastings, and the late Secretary and promoter of the Club, Mr. E. F. C. Damant. On Monday, February 10th, Mr. Humphries (President) will open a discussion on "Dark-room Illumination," and illustrate by several practical tests. Any gentlemen having lamps which they consider especially safe, while giving a maximum amount of light, are invited to bring the same for the purpose of experiment.

PEOPLE'S PALACE PHOT: CLUB:—At an ordinary meeting of the members of this club on Friday, the 31st of January, Mr. Beckett in the chair, an exhibition of members' lantern slides took place, about 100 being passed through the lantern by Mr. W. Barrett. Some very interesting slides were shown by Mr. Downing, of the Workman's Exhibition lately held at the Palace, and also by Mr. Lawday, who had been experimenting with various developers on the Alpha plates.

WEST SURREY AM: PHOT: SOC:—A meeting was held at Crichton Hall, Clapham Junction, on the 29th ult., Mr. Davison in the chair. The evening was spent in a demonstration of the "Flash Light" by Mr. D. Graham, who used lamps made by himself, and was congratulated by Mr. Davison on their successful working. A discussion followed, in which Messrs. Davison, Martin, Calland, and others took part, in reference to the lenses suitable for the subject, and the method of using them. Mr. Graham afterwards exposed a couple of plates on the members, and developed them during the meeting.

ANNUAL DINNER OF THE PHOTOGRAPHIC SOCIETY OF GREAT BRITAIN:—The next annual dinner of the Photographic Society of Great Britain will take place at the Café Royal, Regent Street, on February 10th, at 6.30; tickets, 6s. each. Early application for tickets should be made to Mr. W. England, 7, St. James' Square, Notting Hill, W.

BAZAAR AT NORWICH:—Of a bazaar in connection with the Chapel-in-the-Field Congregational Church, the *Eastern Daily Press* says as follows:—"A feature which should be a great attraction to lovers of the camera, and of much interest to the public generally, consisted in the exhibition of 300 photographs, the work of amateurs, which were entered for a competition arranged by the Editors of the AMATEUR PHOTOGRAPHER. The collection, which was kindly lent through the good offices of Mr. Fuller, is located in the Committee-room upstairs, the walls being well covered with numerous artistic specimens, arranged under the four heads of Inland Scenery, Seaside Views, Animal Life, and Hayfield Scenes. There are some beautiful examples of the new aristotype process included, in which a special kind of paper is used, the impression being printed by light, and afterwards developed on to the plate. These productions have a most finished appearance. Moreover, various shades can be produced, from blue to purple, and from brown to steel colour. The best specimen among the examples of animal life is an obernetter, showing a group of Highland cattle browsing in the Trossachs, remarkable for clearness and distinctness. The finest seaside view gives a 'Sunset off New Brighton,' a splendid piece of work, the shimmer of the waves and the gathering clouds being rendered with great fidelity. This exhibition will well repay a visit."

Exhibitions.

THE ROYTON EXHIBITION.

THE following is the list of awards at this Exhibition. The judges were Messrs. Paul Lange, Watmouth Webster, and Walter D. Welford.

Class 1—Series of Landscape or Seascape (Amateur).—Silver medal, J. E. Austin; bronze, C. Court Cole.

Class 2—Landscape or Seascape (Professional).—Silver medal, J. Pike; bronze, J. P. Gibson; highly commended, Frank M. Sutcliffe.

Class 3—Amateurs' Portraits.—Silver medal, S. Butler; bronze, Alf. Stieglitz; highly commended, J. E. Austin.

Class 4—Professional Portraiture.—Silver medal, W. J. Bryne; bronze, J. Mendelssohn.

Class 5—Architecture (Amateur).—Silver medal, C. Court Cole; bronze, Ernest Beck.

Class 6—Architecture (Professional).—Silver medal, J. P. Gibson; bronze, W. H. Reeves.

Class 7—Enlargements (Amateur).—Silver medal, W. H. Kitchen; bronze, J. H. Faulks; very highly commended, Rev. J. G. Gibson; highly commended, T. J. Bright.

Class 8—Enlargements (Professional).—Silver medal, M. Auty; bronze, F. Whalley.

Class 9—Instantaneous (Amateur).—Silver medal, E. Beck; bronze, Rev. J. George Gibson.

Class 10—Instantaneous (Professional).—Silver medal, Lyd Sawyer; bronze, J. E. Goold.

Class 11—Best Photograph by one who has commenced Photography since January, 1889.—Bronze medal, R. B. Lodge.

Class 12—Lantern Slides (Amateur), Series of not less than Six.—Silver medal, W. B. Kitchen; bronze, Edgar G. Lee.

Class 13—Lantern Slides (Professional), not less than Six.—Silver medal, G. W. Wilson; bronze, G. E. Thompson.

Class 15—Mechanical: Engines, Machinery, etc. (Amateur and Professional).—Silver medal, T. Scotton; bronze, W. Parry.

Class 14—Best Picture taken upon one of Fry's Plates (Amateur and Professional). First prize (an opal enlargement, richly finished in monochrome, and framed in plush, and black, and gold, presented by Messrs. Samuel Fry and Co., Limited), F. Whalley; bronze medal, Walter D. Welford.

Class 16—Scientific: Micro-photography, Botanical and Astronomical Photography, etc. (Amateur and Professional).—Silver medal, G. G. Carnell; bronze, S. F. Clarke.

Class 17—Landscape with Figures or Figure Studies (Amateur).—Silver and Bronze Medal and Certificate, presented by the Proprietors of the AMATEUR PHOTOGRAPHER. Photographs that have been awarded the AMATEUR PHOTOGRAPHER Medals at any other Exhibition or Competition not eligible.—Silver medal, J. E. Austin; bronze, T. J. Bright; certificate, C. J. Roe.

Class 18—Genre Study Competition, for the encouragement of the Art of Posing, and the Study of Figure Photography generally. Subject, Longfellow's "The Happiest Land." Set of Three Pictures in One Frame. (Amateur and Professional).—Silver medal, J. Hubert.

Class 19—Best and Second-best Pictures in the Exhibition, irrespective of Class.—Silver medal, H. P. Robinson; bronze, F. M. Sutcliffe.

Class 20—Champion Class (Amateur).—Gold medal, A. G. Tagliaferro; silver, J. W. Kenworthy; bronze (extra), C. J. Roe; very highly commended, J. Dumont.

Class 21—Champion Class (Professional).—Gold medal, H. P. Robinson; silver, F. M. Sutcliffe; bronze (extra), W. W. Winter.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the *number and full title of the query* referred to.

QUERIES.

3415. **Printing**.—Can anyone tell me if there is any way to get sensitised paper off the negative, which sticks to it through a shower of rain coming on suddenly whilst being printed?—J. A. F.

3416. **Bromide Enlargements**.—I have made several of these from quarter and half plates on Eastman's permanent bromide paper, using the formula for preparation and use of developer, etc., given with the paper, and taking all possible precautions as to cleanliness of dishes, hands, etc. The results have in general been good, with the important exception that a large proportion show what are apparently iron stains after fixing. Will you or one of your many readers be kind enough to endeavour to explain this, and to give a trustworthy formula for the developing, clearing, and fixing solutions?—AMATEUR.

3417. **Conveyance for Touring**.—I intend making a tour through different parts, taking views as I go.

Can any of your readers give me instructions for making a light barrow, such as would carry all photographic necessities, so as to enable me to develop on the spot, or recommend anything suitable?—O. F.

3418. **Shutters**.—I want a shutter, so that I may sit down in a chair, and make an exposure, either short or long, simply by holding or pressing a ball in my hand. The longer I press the longer the exposure is to be, and would also like to be about a yard from the camera. Would you mind giving me the name of a maker or two? It must not shake the camera the least bit. How would Perkin and Raymond's shutter do?—J. F. LESTER.

3419. **Vevers' Lens**.—Will you please give me some advice about the following:—I intend in the spring to have a photographic ramble, and take the photographs of churches, and also other pretty views, and I have got a single lens (5s.) and also Vevers' (18s.6d.) rapid rectilinear. I am going to take them quarter-plate, and then enlarge them on bromide paper. I shall also take a few instantaneous views; and what I want to know is, shall I need more lenses? Can any reader say anything good about Vevers' R.R., as I have done no work with it yet? Which plates out of the Ilford are the best to take lightning on?—P. R. S.

3420. **Lantern Slides**.—I should be glad to know whether a 5 by 4 camera would be most suitable for exclusive work of this kind, or one made of smaller dimensions, say, 4 by 4. The experience of any who have made photography for the lantern a special study would be appreciated by—LIMELIGHT.

3421. **Background**.—How can I make a proper background in taking a person's photograph? When a person gets his head and shoulders taken, there is a kind of shadow all round the head.—PHOTOGRAPH.

3422. **Lens for Detective Camera**.—Would someone tell me what is the cheapest and best lens for a detective camera holding plates $3\frac{1}{2}$ by $3\frac{1}{2}$ ins.—OTTO V. DARBISHIRE.

3423. **Stains**.—Can I get rid of the stains on some of my negatives?—STAINED NEGATIVES.

3424. **Grinding Lenses**.—I have a great wish to grind and polish my own landscape lenses. Can anyone tell me where I can get a book of instructions on grinding and polishing lenses?—W. F. WRATISLAW.

3425. **Switzerland, Ilford Plates**.—Could any reader please inform me whether and where I can get Ilford plates and apparatus at Marat, in Switzerland, twenty-five miles from Geneva, or the nearest town to Marat?—A. OVERTON JONES.

3426. **Waverley Shutter**.—Can any reader tell me where I can obtain the Waverley Express shutter and the price; also ebonite sheets for shutters of slides? What make of lens is recommended for a hand and detective camera, R.R., price being an object? What are suitable shutters for such an instrument?—CRESTERFIELD.

3428. **Forth Bridge**.—Can anyone give me the address of a photographer who would send some

photographs of the Forth Bridge on approval to choose from?—H. C. L.

3429. **Cistern for Dark-Room**.—Is there any objection to using a large tin can as a dark-room cistern, and connecting it with the tap in the dark-room by ordinary lead pipe?—H. C. L.

3430. **Wide-Angle Lens**.—I have a Lancaster's half-plate Instantograph lens, which I find good, and am very well satisfied with; but I want a wide-angle lens. Will some of your readers who have one of their combination Rectigraph lenses say whether the middle focus is as good as the Instantograph lens?—SNOW DROP.

3431. **Ventilation of Dark-Room**.—I intend making a dark-room within another room. Can any reader inform me how to make a ventilator which would not admit light?—AMATEUR No. 1.

3432. **Hydroquinone**.—After using hydroquinone for a couple of negatives I poured it into a stoppered bottle, and put in a dark place. In two or three days it went a deep red colour. Kindly state cause, and if its efficacy is destroyed?—SOUS-MAITRE.

3433. **Opals**.—Can you tell me how the terracotta tint is produced on opals? I don't mean carbon tissue. Where can I get plates, and directions to get same results?—HANDY AMATEUR.

3434. **Fixing Prints**.—Will some one tell me how many ounces of hypo solution (4 ozs. to the pint) are required to fix one average half-plate print? I want to know as a basis for calculation.—HANDY AMATEUR.

3435. **Photographing on the Riviera**.—Can the use of dark-rooms be had by amateurs at Cannes or other towns on the Riviera? Are there any restrictions about taking photographs on the Riviera or the Italian Lakes?—C. J. S.

QUERIES UNANSWERED.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3353, 3354, 3356, 3358, 3359, 3364, 3366, 3367.

17th.—Nos. 3339, 3370, 3371, 3372, 3375, 3376, 3378, 3379.

24th.—Nos. 3383, 3385, 3386, 3389, 3391, 3392, 3393, 3394.

31st.—Nos. 3398, 3401, 3403, 3405, 3408, 3409, 3410, 3412, 3414.

ANSWERS.

3383. **Single Lens**.—I have had a Taylor, Taylor and Hobson's R.V. lens for eighteen months, and am more than pleased with it. It works well at $\frac{1}{16}$ for views, and therefore is quite suitable for instantaneous views in good light. I have obtained a good view of lake and mountains at 8 p.m. in June from a small boat, $\frac{1}{16}$, and exposure about one fifth of a second on a Page 30-plate. The $\frac{1}{8}$ is good for large heads. The distortion of straight lines is only noticeable at the margins, and then but slightly. Mine is a half-plate $8\frac{1}{2}$ inch focus lens with Iris diaphragm.—WALTER BIRCH.

3390. **Whole-Plate.**—"Normandy" can get an adapter from Messrs. Shew and Co., of 89, Newman Street, Oxford Street, whose price for a simple form of same is 39s. 6d.—UXBRIDGE.

3395. **Dark-Room Lamp.**—I have one of Watson's 16s.; good, but the burner is too common in construction and at times smells horribly. I think it would do very well with one of the colza oil burners that are made for the dashboard lamps of coaches. Petroleum is most objectionable in a dark-room.—ANGULUS.

3395. **Dark-Room Lamp.**—I have several forms of lamps which I have used at different times (including one which cost 8s. 6d.), but I have practically discarded all in favour of the cheap "bottle lantern" sold by many dealers. Fallowfield has them, I believe. I only gave 1s. 9d. for mine. They burn candle, and are no bother with oil and general messiness. They give a clear light all round, with no shadows, an enormous advantage in a small dark-room. Altogether I can strongly recommend them.—R. A. R. BENNETT.

3395. **Dark-room Lamp.**—You cannot do better than study Fallowfield's illustrated catalogue, where you will see shapes and prices.—W. A. J. CROKE.

3395. **Dark-Room Lamp.**—Dark-room lamp is made by George Houghton, and can be regulated from the outside, double glass front, 9 ins. by 7. Any coloured fabric can be slipped between.—TIR0.

3395. **Developer for Foreign Travel.**—In reply to "Victor." I have not tried desert travelling, but have found it always a trouble to develop plates while on a journey. A few, however, ought to be developed in order to get correct exposure, and I think he will find MacDougall's developer tubes very convenient, as they are small and packed in wood, and can be carried in the pocket. They can be got from Marion and Co., 22, Soho Square, London, W. Tubes containing sufficient to make 12 ozs. of developer cost 1s. He might send for a sample and judge for himself.—J. G. P. VEREKER.

3397. **Lens.**—A rapid rectilinear is one of the ordinary rapid lenses, and works with full aperture at $f/8$, and a portable symmetrical is a wide angle lens, and the full aperture is $f/16$; details of these lenses will be found in Ross's catalogue, or in his advertisements in the Almanacks.—J. G. P. VEREKER.

3399. **Edwards' XL Pyro and Glycerine.**—The following are Edwards' formulae:

No. 1.

Pyrogallie acid	...	...	1 oz.
Methylated alcohol	...	...	7 ozs.
Glycerine	...	...	$\frac{1}{2}$ oz.

Mix the glycerine and spirit, and add the pyro.

No. 2.

Bromide of potassium...	...	120 grs.
Distilled water	...	7 ozs.
Liquid ammonia (890)	...	1 oz.

To make the developer, mix one part of No. 1 with fifteen parts of water, and in another bottle one part of No. 2 with fifteen parts of water, and use equal portions of each. The dilute solutions do not keep. Develop to full density. Fix in hyposulphite of soda 1 oz. to 4 ozs. of water, and after washing, slightly immerse for one minute in

Clearing Solution.

Alum	...	1 oz.
Citric acid	...	1 "
Sulphate of iron	...	3 ozs.
Water	...	20 "

Wash well and dry.—J. G. P. VEREKER.

3400. **Repairing Kershaw Shutter.**—Fasten a thin piece of black paper over, which you will find is all that is wanted; if this does not answer, send it to the maker, who will soon make it all right.—W. A. J. CROKE.

3400. **Repairing Kershaw Shutter.**—A small piece of waterproofed silk. Put on with naphtha solution.—NAIRN.

3402. **Shutters.**—Kershaw's is the best of the two you mention, and will, I expect, well answer all your purposes.—W. A. J. CROKE.

3404. **Stereoscopic Work.**—(1) $7\frac{1}{2}$ by $4\frac{1}{2}$; (3) single achromatic; (4) simple flap shutter; (5) yes; (6) yes. If "Muwa" likes to write me I can lend him a book giving every information.—W. G. R. (address with Editor.)

3404. **Stereoscopic Work.**—(1) The best size of plate for this work, I think, is $6\frac{1}{2}$ by $4\frac{1}{2}$, as the holders admit of the use of two quarter-plates which allow of separate development and separate printing. (2) I have not yet used the Eastman Company's new film, but intend having a roll-holder for the purpose, as I have no doubt the film is quite suitable for stereo work. (3) For all-round work the R.R. lens is probably the best. (4) I use a Thornton-Pickard. (5) Yes, though this is not advisable unless the negative is cut before being developed; reason obvious. (6) Yes. I use a Chadwick camera and can strongly recommend the plate-holders (Barnett's patent) sent out with this camera. It is well to have the lenses so attached to the camera front as to allow of the distance between them being varied.—AQUÆ.

3407. **Oil Paintings.**—Prop up the picture so that it is vertical, and facing (or nearly so) a south window. Set the camera as parallel as possible to the plane of the picture, and let the lens be the

same height as the centre of it. Take care that no reflected light from the varnished surface is visible from the camera. It is the lens, not the camera, upon which success depends. I use a Voigtlander Euryscope and Edwards' Isochromatic plates. I give details of one copy: December 4th, 2 p.m., $f/11$, light good, 40 seconds.—ANGULUS.

3407. **Oil Paintings.**—"W." had better try orthochromatic plates and a yellow screen. The exposure will be long, but must be found out by experience. I got a good copy on July 31st at the back of a house in London, out of doors, light bad, stop $f/16$, light yellow screen, time $4\frac{1}{2}$ p.m., in 6 minutes. Lens wide angle.—J. G. P. VEREKER.

3408. **Hydroquinone.**—Ferrous-oxalate answers the purpose very well, but I should advise your using the above. Several good formulae have been given in back numbers. Or try the "Hethon Lewis" or Stephens's one solution, which I can highly recommend for lantern work.—W. A. J. CROKE.

3411. **Pinholes in Negatives, etc.**—I am afraid "J. H.'s" failure is due to want of practice. The reason that he thinks the colour gets under the film is that he had touched the edge of the hole. The correct way of working is the following: Use some easily working colour, Prussian blue is generally used, but sepia or crimson lake, or other colours will answer. Mix some on a palette, then dip a fine sable brush in water, and shake out most of the water, so that the brush is pointed and damp, then pick the colour up on the point of the brush, and apply carefully in the centre of the spot; the colour must be nearly dry, and it ought to dry immediately. A large number of spots can be removed by pencil if a good retouching medium be used; and it is best to use it before colour is tried, but for clear holes colour must be used.—J. G. P. VEREKER.

3413. **Earthenware Sinks.**—George Houghton and Son, 89, High Holborn, London, make these a specialty.—NAIRN.

3415. **Earthenware Sinks.**—"Henry Dundas" obtain this of Messrs. Fallowfield and Co., but I should strongly recommend him to get one of their lead sinks on stand, price £3.—UXBRIDGE.

EDITORIAL.

NOTE.—Any one requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT.

LENS.—The firm you name send out excellent lenses. You can safely leave yourself in their hands. State fully to them the purpose for which you require the lens, and they will advise you.

H. CUMMINS.—As far as we know, we have never seen the camera you enquire about, and, therefore, cannot advise you as to the purchase of it. The firm have, we believe, a good reputation, and are not likely to sell you a set of apparatus that will not come up to their description of it.

A. E. VENN.—We appreciate very much the high opinion you have been pleased to express of our efforts to advance and raise photography.

ED. C. DAVIS.—No. 1 is an excellent lens, and should give you all you require. It will work at $f/6$.

CHARLES MALE.—Perhaps No. 1 is the best; but they are all first-class lenses for your purpose, and will either of them do as good work as those made by the two other firms you name.

W. H. BANKS.—We should advise "T." and also that you should write the firm telling them that you required the lens for "confined views of architecture." They will, we are quite sure, advise you for the best. It would certainly not be safe to use a lens only covering $6\frac{1}{2}$ by 5 on a whole-plate.

W. H. ARMITAGE.—If the formula is made up strictly in accordance with the instructions, you should not fail in securing the correct tone.

JOHN H. MONTAGU.—Your letter is, if anything, more absurd than the last. We do not know if your desire is to teach readers of the AMATEUR PHOTOGRAPHER, or to gain a literary reputation. In either case we can only say that such communications are out of place, and show an amount of ignorance that we hardly would have believed existed in the mind of any amateur photographer.

JAS. SHAW.—The prints for "Prize Tour Competition" can all be arranged in one mount. It is best that they should be framed, as it is intended to exhibit as many as possible at the Crystal Palace Exhibition, and framed pictures will have the preference. The prints you ask for are returned.

BERT.—Your print lacks definition; has little or no artistic merit, is badly printed, and you will, we have no doubt, live long enough to rejoice that you "let the negative fall and broke it." The print you so value is returned.

ROB. SHAW.—So we will if you send stamped addressed envelope; but we have no intention of giving a gratuitous advertisement to a man who is selling an article at less than cost price.

T. W. DERRINGTON.—You are restricted to one set in each subject.

W. G. R.—We should like to see your negative before passing an opinion upon the print. Kindly

also give us particulars of lens, stop, light, exposure plate, and developer used. We will then try and give you a few suggestions. Your suggestion about lantern slides should be good for the firm; why not write them? The cheap plates are, we should say, "old stock." None have been sent to us, but we know the history of them, or think we do.

EDWARD SWINGER.—We should quite as soon buy and use No. 2. They are, of course, both first-class, in fact none better; but there can be no reason why you should not save 10s. Our advice is always disinterested, and we are only prompted to give the best in our power, and that which we think will best meet each special case.

L. L. F.—You do not say the size of your condenser. You can easily experiment with the lens, and adjust to the proper focus. You of course require means of adjustment, either with rack and pinion or sliding tubes. We send you the name by post; or can give you no information about them. See reply to "W. G. R." Always glad to hear from a subscriber since No. 1. Cheap things are nasty, so are "sour grapes."

ALUM.—The alum is used as a clearing solution, and with many plates and some formulae is imperative. You cannot go wrong in using a weak solution.

F. A. BRIDGE.—Your advertisement was a trade announcement, and the clerks got mixed as to whether it should appear in Sale and Exchange column. Sorry you had so much trouble. If you want to make a business you must, so our publishers assure us, advertise in the AMATEUR PHOTOGRAPHER. We are sick of writing your address, and wish "Country Cousin" had been far enough before he owned up. Shall not send any more, so if you want to get rid of them you must advertise at usual rates.

FRED DAVIS.—See recent articles on "Carbon Printing," in AMATEUR PHOTOGRAPHER, vol. x., pp. 368 and 433. We do not remember that there was a carbon enlargement included in the "enlargements" recently exhibited at Creed Lane.

H. H.—Photographs that are entered for the "Prize Tour Competition" must not have been exhibited elsewhere prior to the 28th of February. After that date competitors can exhibit prints from the same negatives where they please.

ALEX. FERGUSON.—You should mount half-plates on $8\frac{1}{2}$ by $6\frac{1}{2}$ or 10 by 8 mounts for our Monthly Competition.

J. DESIRE ENGLAND.—Will report upon your celluloid negative films next week.

W. L. GROVES.—Have inserted your letter re "glass discs for condensers." Entry forms have been sent you. Sorry we have not the special year book you ask for. Why not write to the editor, 2, York Street, Covent Garden?

ALPHA.—(1) We have seen good work done with the lens. (2) Should not think it at all likely "to get out of order" if carefully used. (3) Depends upon what you want it for; an R.R. lens is far away the best for all-round work.

M. D.—Cannot criticise photographs sent to our monthly competitions at present.

DR. L. JAMES.—Your camera and lens are good. The other queries we are answering by post.

R. A. R. B., F. G. READER.—See announcement this week.

J. W. BACON.—We shall be pleased to peruse your articles, and to accept them if suitable for our columns.

REV. G. W. ALLEN.—Before making lantern slides of any artists' drawings or sketches from *Funch*, you must have their permission. And if exhibited without will subject yourself to an action for infringement of copyright. Your idea is splendid, and you can follow it out with your own work but not with other people's, without their consent. The slides would not be eligible in the AMATEUR PHOTOGRAPHER Lantern Slide Competition.

THOS. CLARKE.—For the lens you name A is much spoken of, but we think you will do best with B for all-round work. Pleased to hear that your two friends (not photographers) bought copies of the second number of the QUARTERLY. The frontispiece is as you say quite worth framing, and is a fitting ornament for any drawing-room.

W. H. L.—If you want a cheap and reliable lens you cannot do better than buy No. 1.

T. L. BUCK.—Your communication appears, and some rather strong comments upon "the situation" from our pen.

W. G.—Such lantern slides are not eligible. **MARTIN J. HARDING.**—We are not giving the awards. Shall hope to see you Thursday or Friday when you call.

J. H. STARBUCK.—Thank you. Our publishers will see Messrs. W. H. Smith and Sons upon the subject.

W. P. P.—The lenses B and D are both well suited for your purpose. Both are admirable lenses.

J. L. D. GRANT.—Yes. Your list of extra numbers is correct.

ELECTRA.—We do not know the gentleman in question, and should advise you to have the apparatus on approval before you buy. The apparatus is good of its kind. So is the lens which you name; but at the same time not to be compared to those of the older makers referred to in your letter. You should aim at a short-focus R.R.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop, or wd counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer."—100 latest numbers AMATEUR PHOTOGRAPHER, 20 "Year Books," offers requested.—P. Bass, 65, Crocus Street, Nottingham. 30 consecutive numbers of AMATEUR PHOTOGRAPHER up to date; what offers?—Wallis, Iron Gate, Derby.

"Amateur Photographer," etc.—AMATEUR PHOTOGRAPHER, vols. vii. and viii. (viii. leather-bound), containing Wall's "Dictionary," vols. ix. and x. containing Robinson's valuable articles, illustrated; "Photography," vol. i.; "Year Book," 1888 and 1889; perfect; offers.—Weare, 5, Kingsland Road, Birkenhead.

Bicycle.—1890 Diamond Safety; list price, £15; all extras; £7 7s.—Potter, Cyclist, 2, Peter's Street, Norwich.

Burnisher.—Half-plate burnisher, with spirit lamp, complete; 9s.—M., 257, Fulham Road.

Cameras.—7½ by 5 camera (by Scott), three double backs, and canvas waterproof case, all in good condition; price £5.—B., Clifton Hill, Garstang.

Kodak, never been used, 100 films, perfect, three guineas; wanted, 7½ by 5 Eastman roll-holder.—Shaw, 5, Great Ancoats Street, Manchester.

Lancaster's half-plate Instantograph, reversing back, instantaneous lens, Iris diaphragms, shutter, two double backs in solid leather lock-up case, patent universal stand in case, price £4 15s.; Diamond detective camera for 12 plates, in leather case, shoulder strap, new, 32s. 6d.—J. Cass, 7, Cocker Street, Blackpool.

Cameras, etc.—Half-plate camera and three double backs, all best make; price £3 lowest.—V. A. G., 20, Pembroke Road, Kensington.

Turnbull's detective camera, price £2 10s.; Kershaw's shutter, for whole-plate lens, 10s.; Reynolds and Branson's Phoenix shutter, whole-plate lens, 6s.—Wratislaw, Braunston, Rugby.

Half-plate Kinnear camera and three double slides, Ross's 8 by 5 R.S. lens, in perfect condition, Aptus W.A. lens, quite new, both in leather cases, Newman's shutter, almost new, and in perfect order, solid leather case to hold the lot, and mahogany tripod stand; cost £18; price £11.—Ponting, National Provincial Bank, Liverpool.

"English Mechanic."—Vols. xvi. and xvii. "English Mechanic," complete, unbound, clean;

what offers in photographic goods or cash?—Gould 12, Paragon, Streatham Hill.

Lanterns.—Archer's Photinus, complete in case, four-wick patent lamp, 4 in. condensers, new last November; price, cash, £4; bargain.—Harrison, Registrar, Warrington.

8 in. enlarging lantern, complete; also head-rest with motions, new, by Lancaster; £3 10s.—Green, Aston Road North, Birmingham.

Lenses.—Splendid half rapid rectilinear lens; 2½s.; bargain.—Bull, 5, Alvey Street, Walworth.

Whole-plate portrait lens (Marion's), good as new; price £3; approval.—Simmons, Phoenix, Liskeard.

Ross's No. 3 portrait lens, 3½ in. diameter, 10 in. focus, for cabinets, or with stop for whole-plate; cost £17 10s.; price £7 10s.; Dallmeyer's 2B, £7; 1B, 70s.—Pedder, Gold Hill, Gerrard's Cross, Slough.

Very rapid cabinet portrait lens and stops; 30s.; bargain.—Taylor, G adstone Terrace, Worsley.

Half best view lens (Taylor and Hobson), nearly new; 20s.; or good quarter set.—61, Gayhurst Road, Hackney.

Lenses, etc.—Triplet lens, 15 in. focus, six diaphragms, £2, or exchange for good quarter set, lantern, or offers; also two gas bags, pressure boards, retort purifier, good order, cheap for cash.—Kerrigan, 128, Dalmarock Road, Glasgow.

Lancaster's quarter Instantograph lens and shutter, Iris diaphragms, two fold tripod, Rubralux lamp and burnisher; 25s.—Staveley, 57, Barbican, E.C.

Model.—Handsome old-fashioned model war ship, suit captain; price £14.—Burt, 67, Forest Road, Dalston.

Negatives.—20 half-plate negatives, landscapes, churches, etc., for transparencies; samples 1s. each.—Simmons, 3, Waterfall, Lower Tooting.

Organ.—American organ, most handsomely finished, superb tone, 16 stops, 2 swells, 9 sets reeds, 29 decorated pipes; price 32 guineas.—Burt, 67, Forest Road, Dalston.

Sets.—Quarter-plate camera (rack and pinion for focussing), B.R. lens, four double backs, all by Stereoscopic Company, and in good working order; £2 5s.—R. Heath, Leighton Buzzard.

Half-plate Universal camera, three double backs, reversible, Plumb indicators, detective case, fitted with Thornton-Pickard shutter, fourfold tripod, double extension, three B Suter lens, new, cost £18 18s.; price £12 12s.—6, Montford Place, Kennington Green.

Lancaster's half-plate Instantograph 1889, two double dark slides, instantaneous shutter, and tripod, complete; £2 10s., open to offers.—Cummins, 19, Shepherd's Bush Road, W.

Half-plate set, very light compact camera, long extension, swing back and front, fitted spirit level, capital lens, Marion's rapid rectilinear, one mahogany and three metal dark slides, drop shutter, leather case, Watson's 30s. cyclists' tripod, three dishes, and practical instruction if desired, a great bargain; £5 10s.—T. Edwards, 83, Chesterton Road, North Kensington, W.

Lancaster quarter-plate International camera, tripod, four metal slides, good condition, Optimus 5 by 4 R.R. lens, new; £3, or exchange, with cash, for half-plate set, mutual approval.—D., 44, Malvern Hill Road, Birmingham.

Lancaster's 1888 Instantograph camera and tripod stand, with case complete, also Optimus plunge shutter to fit half-plate lens; 80s.—Apply Photo, 8, Cobham Street, Gravesend.

9 by 7 Ross rapid symmetrical, in new condition; £5 5s. 8½ by 6½ ditto; £4 15s. 10 by 8 Dallmeyer triplet; 75s. Ross's 7½ by 4½ camera, one double back, division for stereos, swing back, rising front, etc., with Burr rapid lens, in leather case; £4. Wanted, battery of Ross's portable symmetrical

lenses, from 3 in. to 8 in. focus.—Collins, Chalfont, Slough.

Optimus whole-plate long extension square camera, all movements, stereo partition, three double backs, Hare's changing box to fit, patent tripod sliding legs; £8. Also Shew's half-plate eclipse hand camera, six double backs, leather case; £7 10s. Also Hughes' enlarging apparatus for 10 by 8 negatives, lime light jet, and oxygen cylinder, special combination lens, only used a few times, cost £32 odd; will sell cheap.—Apply C., care of Housekeeper, 93, Bishopsgate Street, London, E.C.

Studio.—New, made in sections, easily removed, splendid lighting; cash or exchange, jewellery preferred.—A. Jaques, 8, Rettleton's Road, New Cross, London.

Shutter.—Mahogany drop shutter, new, adjustable, fit 2 in. hood or larger, cost 11s. 6d.; 6s.—Wallis, Ingrave, Derby.

WANTED.

"Amateur Photographer."—No. 173 (March 2nd, 1888), AMATEUR PHOTOGRAPHER.—Photographic Society, Dulwich College.

Apparatus.—A photographer, about to open a branch studio, would like to hear from anyone having anything good and cheap for sale in connection with the art.—Address, Thompson, Photographer, Omagh, Ireland.

Cameras.—Lancaster's 1889 Instantograph, half-plate, complete, in good condition.—Stute lowest price to Joy, Boston Road, Hanwell.

Half Instantograph; exchange half Meritoire complete, and 64 in. bicycle, worth 70s.—Battell, 66 Milton Road, Hoe Street, Walthamstow.

Shew's Eclipse hand-camera, with changing back; 5 by 4 or half-plate preferred.—E. T. Wood, 18, Barbican, London.

Quarter or half-plate camera, cheap, for cash; long-focus preferred.—S., 178, St. John Street Road, Clerkenwell.

Camera, etc.—Whole-plate camera, double extension, reversing back, with or without slides (old pattern no objection), cheap.—Charles Smallridge, Ivy Bridge.

Lenses.—Quarter-plate wide-angle doublet lens, in good condition, cheap.—John Wilson, Glenarm, North Ireland.

Short-focus lens, Rectigraph preferred, for use in quarter-plate detective camera.—F. Hutchins, 66, Peckham Road, London.

Good half-plate W.A. rectilinear lens.—John E. Pim, Bonaven, Antrim Road, Belfast.

Optimus W.A. lens, half-plate, 4½ in. focus; approval; deposit.—Francis B. Williams, Corris, North Wales.

Good cheap 5 by 4 or quarter lens, fixed focus, for hand-camera, single, achromatic or doublet.—Dearden, Thorn Bank, Giltow, Bolton.

Prints.—Loan of quarter-plate specimen prints by Taylor's 5 in. 3D detective lens, taken with largest stop/f5.8, for examination of definition only.—W. K., 91, Turton Street, Bolton.

Set.—Tourists' modern photographic apparatus, complete, half or whole plate; full particulars and lowest price for cash; say if would take splendid binocular lantern part exchange.—M., 77, Queen Victoria Street, E.C.

Shutter.—Kershaw shutter, 2½ in. diameter.—Digges, William Street, Cheetham Hill, Manchester.

Slides.—Three Tylar's half-plate slides, perfect condition, in exchange for Lancaster's half-plate 1889 Instantograph slide.—Fred Fenwick, Fern Avenue, Newcastle.

NOTICES TO SUBSCRIBERS.

Subscriptions must be prepaid.

UNITED KINGDOM	Six Months, 5s. 6d.	Twelve Months, 10s. 10d.
POSTAL UNION	" 6s. 6d.	" 12s. 0d.
INDIA, CHINA, ETC.	" 7s. 9d.	" 15s. 3d.

NOTICES AS TO ADDRESS.

PUBLISHING DEPARTMENT.—All letters containing Subscriptions, Orders, Remittances, SALE AND EXCHANGE Advertisements, or other business matters for the **Amateur Photographer** are to be addressed to the Publishers, HAZELL, WATSON, AND VINEY, LD., 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—SALE AND EXCHANGE Advertisements, at the charge of Three Words for One Penny, can be received as late as WEDNESDAY MORNING.

ADVERTISEMENT DEPARTMENT.—All communications respecting TRADE Advertisements in the **Amateur Photographer** are to be addressed to PARRY AND CRAWFORD, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

NOTE.—Trade Advertisements are received up to Tuesday morning.

EDITORIAL DEPARTMENT.—All Literary Contributions, Queries and Answers, Photographs for Competition or Criticism, Books or Apparatus for Notice or Review are to be addressed to the Editors, **Amateur Photographer**, 1, Creed Lane, Ludgate Hill, London, E.C.

NOTE.—To ensure insertion all Communications should reach the Editors on Tuesday.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the **AMATEUR PHOTOGRAPHER** have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

First Prize ... Silver Medal and £1 1s. 0d.
Second Prize ... Bronze Medal and 10s. 6d.

Photographs must be sent in on or before Monday, the 10th of March. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the **AMATEUR PHOTOGRAPHER**, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition," The Editors, **Amateur Photographer**, 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" LANTERN SLIDE COMPETITION

(SECOND YEAR).

PRIZES.

"AMATEUR PHOTOGRAPHER" GOLD MEDAL

FOR THE MOST ARTISTIC SET OF FOUR SLIDES.

CLASS I.—GELATINE PROCESS:—

FIRST PRIZE		SILVER MEDAL AND	£2 2 0
SECOND "		BRONZE "	1 1 0
THIRD "		CERTIFICATE "	0 10 6

CLASS II.—COLLODION PROCESS:—

FIRST PRIZE		SILVER MEDAL AND	£2 2 0
SECOND "		BRONZE "	1 1 0
THIRD "		CERTIFICATE "	0 10 6

Competitors may enter in either of the above Classes, and may select any or all of the following subjects for Competition, not less than four Slides being sent for each subject.

SUBJECTS.

- | | |
|---|--|
| (a) Landscape (with or without Figures). | (e) Architecture (Exterior or Interior). |
| (b) River Scenes (Waterfalls, etc.). | (f) Animals (Instantaneous Studies). |
| (c) Seascapes (Marine Studies, including Shipping, etc.). | (g) Scientific (Microscopical, Astronomical, Botanical, Geological, etc.). |
| (d) Figure Studies, Genre Pictures (Village Life, etc.). | |

All Slides must be received on or before the 14th day of February, 1890.

The Slides, or a selection of them, will be exhibited, by kind permission of the Crystal Palace Company, at the Photographic Exhibition to be held at the Palace in March next.

All Competitors will receive a FREE TICKET for the Exhibition and the Lantern Show, to admit self and friend. Due notice will be given when the date is fixed.

All Slides must be carefully packed, and must be received on or before the 14TH OF FEBRUARY, 1890, endorsed—"Lantern Slide Competition," The Editors, "AMATEUR PHOTOGRAPHER," 1, Creed Lane, Ludgate Hill, London, E.C.

Rules, Conditions, and Entry Forms will be forwarded on receipt of stamped addressed envelope addressed to the Editors: "AMATEUR PHOTOGRAPHER," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" PRIZE TOUR COMPETITION, 1890.

(FIFTH YEAR)

PRIZES.

First Prize—"AMATEUR PHOTOGRAPHER" GOLD MEDAL.

Second Prize	-	£4 4 0 and Silver Medal.	Sixth Prize	-	£2 2 0 and Bronze Medal.
Third	..	3 13 6	Seventh	..	1 11 6
Fourth	..	3 3 0	Eighth	..	1 1 0 and Certificate.
Fifth	..	2 12 6 and Bronze	Ninth	..	0 15 0
Tenth Prize			- £0 10 6 and Certificate.		

Photographs entered for this Competition will be Exhibited at the Crystal Palace, FREE OF CHARGE.

All Photographs and MSS. must be endorsed "Prize Tour Competition," and addressed to the Editors, **AMATEUR PHOTOGRAPHER, 1, Creed Lane, Ludgate Hill, London, E.C., on or before the 28th of February, 1890.**

Rules, Competitor's Form, and Form of Declaration will be sent on application to Editors, as above.

[PRICE TWOPENCE.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare*

WE publish a letter from Mr. H. Maclean, F.G.S., with regard to the formation of the Croydon Camera Club. It sets forth the objects of the Club and the prospects of success. A meeting will be held very shortly, and Mr. Maclean will be glad to hear from all intending subscribers. We have already spoken in no uncertain voice as to the desirability of establishing a Club at Croydon, and shall be very pleased to support the movement by any means in our power. We have written to Mr. Maclean offering the AMATEUR PHOTOGRAPHER Silver and Bronze medals, for competition by members of the Club, when formed, who are amateur photographers. There should be no difficulty in enrolling from fifty to a hundred amateur workers, and we wish the scheme every possible success.

* * * *

THE Secretary of the West Surrey Amateur Photographic Society announces that it is intended to hold an exhibition of members' work on the evenings of March 26th, 27th, and 28th. This Society is quite one of the best of the suburban amateur photographic societies, and has the advantage of the support and counsel of Mr. J. Gale and Mr. George Davison. Amateur photographers living in the district should assist by becoming members.

* * * *

WITH regard to the assertions made by us last week as to the dishonesty of professional photographers, we find in the editorial columns of our esteemed contemporary, the *British Journal of Photography*, of the 7th inst., our views strongly supported by the following paragraph:—

"For a long time past photographs have been looked upon with distrust in the Law Courts, and in the Divorce Court in particular they are refused as evidence of identity. But this, apparently, only applies to the London Court, for, according to the newspaper reports, in a divorce suit recently tried in Scotland photographs were admitted as proof of identification. Scotch and English judges evidently hold different opinions with regard to the integrity of photography. There can be no question that since retouching—or what passes by the name—has been carried to its present extent, the public are decidedly losing confidence in the truthfulness of photography, so far at least as portraiture is concerned."

Cannot professional photographers be taught to understand that the public are gifted with common sense, and that sooner or later, as our contemporary sees, they will lose confidence in the truthfulness of photographs, and will refuse to accept as portraits the inane, vapid, and meaningless "things" that are handed over by the "art" photographer as counterfeit presentments of their sitters? Such things must obtain, so long as retouching the negative is permitted to be done by persons usually having had no art training, and who have never in their life seen the subject whose features have been translated by the lens on to the sensitive plate. If retouching is permissible, it should be done by a person having been trained and well versed in art principles, and with the subject *present* whilst the work is being done; we may then arrive at something like a perfect portrait by photography, assisted by the few 'softening touches' that are required from the pencil of an artist. So long as negatives by the score, many of them possessing all the faults a negative is heir to, are sent to professional retouchers having little or no knowledge of art or of any of the peculiarities of form and feature of the sitters, and who employ uneducated girls to "work up" each negative on identically the "same lines," so long will photography be untruthful, and misrepresent the reality of nature, and represent in all its glaring reality the "art" of retouching.

THE AMATEUR PHOTOGRAPHER has stopped professional retouching as far as work entered for competition for their medals goes, and in the amateur section of all well-regulated exhibitions care is taken that if any retouching is done it shall be the work of the exhibitor. We do not defend even this concession, but the exhibitor has at least a feeling in the matter, and has seen the sitter, the subject, or the view, and will not obtrude the work of retouching. The professional retoucher has no such compunction, and has succeeded in teaching the public that a photographer is untruthful. As a collection of truthful photographs, we should imagine those taken within the precincts of Her Majesty's prisons are the only ones extant. We do not and never have encouraged amateur photographers to go in for taking portraits, it would be an interference

For Contents, Prize Competitions, Notices, etc., see page 111.

with trade, but we do hope the many professional photographers who we know read, and we hope profit by, this journal will take our remarks to heart and no longer allow their own organ, the *British Journal*, to be able to say that "The public are losing confidence in the truthfulness of photography, so far at least as portraiture is concerned."

Many of us laugh at the ungainliness of those photographs taken twenty or even twenty-five years ago, which every one possesses, and which are hid away, and too often passed over, in the family album; but they were truthful and did not fade and within a few months possess not the slightest resemblance to the sitters, as is too often the case with the majority of the work done by the so-called "art" photographer.

* * * *

THE Manchester Amateur Photographic Society show a capital record for the year 1889 in the annual report which has just been published. The Society is the largest of the kind in the United Kingdom, "and is still growing," no less than twenty-three being up for election last Tuesday. The Society has now 293 members. The accounts show a balance in hand of £44 8s. 10d. The Society's Journal continues to be a success, and is conducted with considerable ability. Many books have been added to the library. During the year many papers have been read, demonstrations given, and lantern exhibitions held; many excursions have been taken, and much good work done. A photographic exhibition was opened on Thursday last, continuing over Friday and Saturday. On the evenings of both days lantern exhibitions were arranged. All the prints, transparencies, stereoscopic prints, lantern slides, etc., must be the members' own work. The lantern slides must not only be the members' own work, but must not have been exhibited at any previous exhibition of the Society. Other societies, please take note.

* * * *

DURING the last few years the name of Walery has become familiar to all those interested in photography, and the head of that firm, Count Ostrorog Walery, has done much to elevate portrait photography. His ability as a photographer was soon recognised after he started in business in London in 1883. The investing public have now an opportunity offered them of participating in the business, or rather they are asked to find £37,000 to purchase the opportunity of participating in the profits, which are stated to have been large.

* * * *

A CORRESPONDENT, honorary secretary of an important photographic society, writes us, "I quite agree with you that amateurs and professionals should not be classed together, as I consider every picture they send out has had four or five specialists at work on it, and consequently an amateur would have to compete with four or five persons instead of one; so I hope you will continue strong on that point."

* * * *

THE Stereoscopic Slides contributed to the recent AMATEUR PHOTOGRAPHER Competition will be on show at our offices, 1, Creed Lane, on Wednesday evening next, the 19th inst., from 7 till 10 p.m. We shall hope to be present during the whole of the evening, and shall be glad

to welcome all interested in stereoscopic photography, and we hope many who have not yet taken up stereography will embrace the opportunity of inspecting the slides. Some advances have been made through our competitions, as we understand one maker alone has sold upwards of 200 stereoscopic cameras during the last twelve months or so.

* * * *

WE would again remind intending competitors that the Lantern Slides for our Competition must be forwarded to us by the 14th inst. They will be judged, as far as present arrangements have been made, on Friday, the 21st inst., and the awards published in the AMATEUR PHOTOGRAPHER of the 28th inst.

* * * *

OUR criticism on the Royton Photographic Exhibition is delayed, but will be published, we hope, in our next issue. We understand that as a whole the exhibition is a pronounced success. But we are surprised to find, out of some 107 exhibitors, 25 only are resident in Lancashire, made up of 14 from Oldham, Royton, and district, 9 from Liverpool, and 2 from Manchester. We will leave further comment until next week.

* * * *

THE Stockton Photographic Society will hold their third annual conversazione on the 25th inst., upon which occasion there will be a photographic competition. The silver and bronze medal of the AMATEUR PHOTOGRAPHER are offered, also the President's gold medal, silver medal for lantern slides, bronze medal for enlargements, and a bronze medal open to members and non-members of the Society.

* * * *

WE note that, mainly through the exertions of their able and clever Hon. Secretary, Mr. Ernest Beck, the Sheffield Photographic Society announce a grand exhibition of lantern slides to be given on Thursday, the 27th inst. The object for which the exhibition is held is, primarily, to show the public "local views and gems of English scenery" by means of lantern slides made chiefly from the negatives taken by members of the Society. We might add that not only does the Society possess the services of an energetic Hon. Secretary in the person of Mr. Beck, but they have reason to be proud of his achievements as an exhibitor at recent exhibitions. There are also many other members who have shown good work, and they have only to study and persevere, and to stand side by side with Mr. Beck.

* * * *

PHOSPHORESCENT PHOTOGRAPHS.

AMONG the innumerable letters which reach our editorial office have lately been two or three asking for information regarding the production of photographic pictures which will shine by their own luminosity in a dark room, and about which the writers seem to think that a kind of mystery must hang. Such pictures have been prepared as curiosities, and we fancy that if they were more common they would meet with a wide sale. But there is no real mystery about them, for they consist merely of transparencies on glass, which are framed with a backing covered with Canton's phosphorus, which, under the name of Balmain's luminous paint, has become somewhat familiar in various employments during the past few years.

Phosphorescence is a curious condition of matter of which

we can find examples in the animal, vegetable, and mineral kingdoms. The glowworm, petted of the poets, is of course the most familiar example to which we can point, if we except the sea, the luminosity of which was often commented on by the oldest writers, who endeavoured to explain it in many curious ways. Thus an old writer states that the ocean absorbs part of the sun's rays, and gives them up again in the dark hours. Even such a distinguished scientist as Robert Boyle attributed the strange light to the friction caused by the waves rubbing against the atmosphere. It is now well known that the beautiful sheen upon the sea is due to a minute organism, the *noctiluca miliaris*—at least, this is the origin of the phosphorescence on our own coasts. But many different self-luminous infusoria contribute to the more splendid effects often noted in warmer latitudes. Earthworms and other creeping creatures have occasionally been observed by naturalists to assume a luminous condition. In the vegetable kingdom some plants will, under peculiar conditions, become luminous, and it is the characteristic of certain cryptogamic plants which are found in the Swedish mines, and also of a red mushroom which grows in Italy at the foot of the olive trees. Canton's phosphorus is a product of the mineral kingdom, and its discovery is comprised in one of those fairy stories of science which are only unlike ordinary fairy stories in being actually true.

The story dates back to the commencement of the seventeenth century—that age of belief in wonders—a period when the philosopher's stone was no fable, but a reality to all men—after which so many strived in their haste to be rich—in the pursuit of which useful labour was cast aside, money was squandered, and life itself sacrificed by so many credulous men. The discovery of the first phosphorescent mineral substance was, in fact, due to a searcher after that myth, and is one of the many instances in which its pursuit led to the knowledge of something else which was destined to be of future use to mankind. We might, without exaggeration, parody Voltaire's well-known aphorism, and say that if a belief in the philosopher's stone had not existed, it would have been necessary to inculcate one, so much richer has the world become by the useful discoveries to which its pursuit led.

The discoverer in this instance was a son of St. Crispin whose mind soared above boots and shoes, and constantly dwelt upon the possibility of finding the mythical treasure. His name was Cascariolo, and he was a native of the city of Bologna. Walking in the vicinity of the city one day, his eye lighted upon a stone which seemed to him to have a sufficiently remarkable appearance to justify him in taking it home for more careful examination. Arrived there, he soon displaced the implements of his trade, lighted a fire, and upon it placed a crucible, in which he threw his newly-found treasure, together with some charcoal. He watched this cooking operation with some anxiety, fondly hoping that when the crucible became cold he would find a button of gold beneath the dross within it. There was no gold, but a change had occurred in the piece of stone—it had become phosphorescent. In a word, the mineral which he had picked up was a piece of heavy spar, or sulphate of barium. Its heaviness had probably attracted his cupidity in the first instance, and by calcining it with charcoal he had transformed it into sulphide of barium—a now well-known phosphorescent substance—which is still

sold in the streets of Bologna as a curiosity, and is called Bologna stone.

It is to Becquerel, who invented an instrument called the phosphoroscope, that we are indebted for much knowledge concerning phosphorescent substances. Canton's phosphorus is analogous to Bologna stone, only it is produced from calcium instead of barium. It can easily be prepared by calcining oyster shells in the presence of sulphur, when sulphide of calcium results. This is the basis of Balmain's luminous paint, but there are doubtless trade secrets in its preparation which add greatly to its effectiveness. The substance is mixed with varnish, and then assumes the form of a paint which may be applied to any suitable surface. Gum is sufficient to bind its particles together, and this would be the medium employed for covering cardboard with it as a backing for transparent photographs. One disadvantage in the preparation is that it seems to undergo partial decomposition, and in doing so gradually deteriorates, giving off fumes of sulphuretted hydrogen. It is therefore wise to protect the photographic film with a coating of varnish, and to keep the glass side of the picture next the composition. The phosphorescence can at any time be aroused by exposure to daylight, or to the rays of burning magnesium. Those amateurs who are fond of experiment may find much amusement for themselves and their friends in the production of these luminous photographs.

Letters to the Editors.

COPYING.

SIRS,—Since the above has appeared in your columns, I take the opportunity of giving my own experience on the subject. I shall first begin with line-work—such as engineering drawings, etc.—this branch being about the most difficult. In this case it is imperative to use a *slow* plate; stop the lens down to about $f/24$, and give a long exposure. The best plate to use is Mawson's photo-mechanical, giving an exposure of from six to ten minutes, in a well-lighted glass house (which is the best place to do this kind of work in). Use a developer strong in pyro (about three to four grains to ounce of water), and well restrain with amm. brom., and use less ammonia solution than if developing an ordinary negative. It is in some cases preferable to use a more rapid plate than the one mentioned, and I have found Fry's *slow* bromide plate to answer perfectly; but if these are used, they will only require about one-fourth the exposure of those previously mentioned, under the same conditions. They will also require greater care in development. The developer in this case should contain more pyro solution than ammonia, and a few drops of a 60 per cent. solution of amm. brom.; it should also be diluted to half its bulk with water. Development will be slow, but if sufficient density is not obtained in the high lights (in this case, the white paper of the drawing), ten minutes after the application of developer, add a fresh quantity, the same proportions as before; but *undiluted*, which in most cases will be sufficient to increase density.

The object to aim at is, to avoid the veiling and blocking up of the lines composing the drawing, which should be clear glass in the negative, and great density in the high lights; and this can only be done by using ammonia very sparingly.

In copying photographs on albumen paper the (day) light must be softened by filtering through white linen, so as to avoid reflection of light from the gloss of the print, and a *slow* bromide plate used; lens stopped down, and a long exposure given. Develop tentatively as before, but with *equal* quantities of pyro and amm. restrained with brom. amm., and diluted to half its bulk with water, and proceed as before-mentioned, adding fresh developer undiluted, if sufficient density is not obtained with the first. Yellow,

faded prints should be copied at night, and the best way to illuminate prints is to throw light on print through a condenser with an ordinary oil lantern. Use a *rapid* plate (isochromatic the best), stop lens down to $f/16$, and give about four minutes' exposure, and develop as in the previous case. In copying coloured pictures, orthochromatic plates are best; and these are best copied by daylight; develop tentatively with a weak developer, so as to obtain gradation.

In all these cases it will be seen that tentative development is the *sine quâ non*. It is essential that all pictures to be copied should be flat and at right angles to the axis of the lens; and the best way to ascertain this is set up the camera in position and focus the size required, then attach one end of a string to centre of cap, and a pencil or piece of chalk to the other end, put cap on lens, and extend this with the hand towards the picture to be copied, so that the string is tight when the pencil touches the picture, and if the picture is in the right plane, the pencil will touch every part of the picture equally, by moving the pencil round the surface of the picture. Don't copy the picture till this is obtained. I have not mentioned any particular developing formula, as any good *pyro* formula will answer well, mixed in the way I have described.

I have now several lantern-slides which I have made from copies done in the way I have described, which show equal in definition, etc. (on a 10 ft. screen), as direct takings. I should be pleased to show these to any one wishing to see them, by appointing an evening with me, by letter; address with Editors.—Yours faithfully,

February 1st, 1890.

G. GORDON.

IS HYDROQUINONE POISONOUS?

SIRS,—A letter on this subject appeared in the *AMATEUR PHOTOGRAPHER* for January 10th last, and I have waited to see some remarks upon the subject. Nothing has appeared yet, so I am wondering if your correspondent has been the only one who has found any baneful effect from the use of the chemical in question.

Some time ago I noticed that one of the journals spoke of hydroquinone having a poisonous action, and probably this is the statement to which "A Victim" refers. A short time after this I also read a counter statement to the effect that the makers of the chemical had found no toxic effect among their work-people.

Among the many hundreds of my own correspondents I have not had one suggestion that the popular developer was injurious in the slightest degree; yet I saw some time back that a gentleman had experienced untoward results from using this chemical, and as the *Photographic News* mentioned his name, I wrote to him on the matter. In reply, he very kindly gave the full details, and gave the facts of his case, which was practically the same as your correspondent's. Possibly they may be one and the same. At any rate, I have been on the look-out since for any information that will throw light upon the subject, the more so as I hoped to be able to explain the cause of the affection which the gentleman I refer to had suffered from.

The mystery about hydroquinone, and its action on the skin, may be explained on the ground of the "special idiosyncrasy" of the individual. I am inclined to this belief from the fact that hydroquinone is used as a medicine internally as an antipyretic and antiseptic. Martindale's *Pharmacopœia* states that "gramme doses cause symptoms of excitement like resorciné. It causes no local irritation injected hypodermically, is particularly suitable as an antiseptic in eye operations, etc., and does not irritate the conjunctiva or cornea."

Dr. J. Mitchell Bruce, in his "Materia Medica," and Dr. Whittall give the dose of hydroquinone as from 10 to 15 grs. It is interesting to notice that *pyro* (our old friend) is sometimes employed in medicine, but the dose is only from $\frac{1}{2}$ to 1½ grs. ! This should speak well for hydroquinone, surely !

In conclusion, I need only point out that as hydroquinone is said to cause no local irritation, and does not irritate the extremely delicate membrane of the eye ("conjunctiva"), we ought to be able to feel pretty safe in using the developer. It may be that the other ingredients of the solution used form some deleterious compound that is injurious, but if this be so, and apart from the idiosyncrasy of individuals, we shall surely hear of it.—Yours faithfully,

C. HERTON LEWIS.

P.S.—I fully sympathise with your correspondent, and if not entirely recovered yet, I can give some further information as to cure, if I hear further.

DISCS OF GLASS AS CONDENSERS.

SIRS,—In your issue of last Friday I notice that your correspondent Mr. W. L. Groves is in difficulty about his condensers. With your permission I will endeavour to describe a method by which I dispense with condensers altogether, using magnesium as the source of light, and ground glass to distribute it evenly over the surface of the negative. I can enlarge from any size negative, from quarter-plate upwards. I will assume that your correspondent knows the way to develop bromide paper, etc., and that it is essential to use a lens that will cover an area quite sharply as large as the negative, or, in other words, that the lens used to enlarge with may with advantage be the one the negative was taken with. My plan is briefly as follows:—I have a box the dimensions of which are, height 2 ft. 6 ins., width 2 ft., depth from front to back 2 ft. 9 in. In my case the box is of wood, but I would suggest as an improvement that it be of tin or sheet iron. The back is fitted with a door nearly as large as the back itself—this door must fit quite light-tight; the front is fitted with carriers to take all size negatives in general use; the top must always be of stout tin or iron, and fitted with a chimney, which will not let any rays of light escape, as this would fog your bromide paper. At the side of the box, about midway between back and front, drill a hole, and this hole must be also midway between the top and bottom of box, so that when a piece of brass tube is pushed through the hole the end of it may be opposite the centre of any negative that may be in the carrier at the time. The length of brass tube should be about 1 ft. 9 ins., and the diameter a little larger than ordinary magnesium ribbon, in order that when the ribbon is being pushed through, it shall not stick and refuse to pass. There must be a little peep-hole in the side of box a little above the hole where the tube goes through. This peep-hole must be of ruby glass, through which the progress of the combustion of the ribbon can be seen.

The enlarging camera must fit closely up to this box, and take care that the lens is in a line with the centre of negative, otherwise there will be unequal definition in the resulting print. Now, for focussing it is necessary to use a good powerful duplex paraffin lamp; this is to be placed inside the box, and should have a silvered concave reflector behind it to concentrate light on negative. Of course, the light will not be diffused evenly, but it will do well enough to focus with. A piece of ground-glass rather larger than the negative to be enlarged from must be placed behind negative about one and a half inches. Having focussed the image on a piece of plain paper, take away lamp, and place a small glass spirit lamp in its stead. Now pin up the bromide paper, and commence exposure by pushing one end of a coil of magnesium ribbon through the brass tube which should be in the hole in side of box. As soon as the ribbon touches the spirit flame it will generally begin to burn. The ticklish part of the business now commences. The tube must be moved about upwards and downwards and to and fro, in order that the light may not settle in one place and so produce a dark mark. There is, however, an exception to the above. Supposing I am enlarging from a negative in which the sky is much over-exposed and too dense to print clouds which may really exist there, then the light should be kept moving just in front of the dense part and slightly nearer to the negative than for the exposure of the thinner parts. If the hole through which the tube goes is large enough, there is, of course, a universal movement, and the tube can be brought nearer or farther from negative, also up or down or sideways. I can easily observe from the side of box how the light is being distributed, as it shows plainly on the bromide paper. After one or two trials using only plain paper, your correspondent will doubtless become dexterous in the use of this enlarging box, which I may say I have not seen before described in any journal. If any further particulars are required I shall be pleased to answer any questions that your correspondent may think fit to ask.—I am, sir, faithfully yours,

February 10, 1890.

FREDK. W. MUNCEY.

* * * *

HAND CAMERAS.

SIRS,—At Easter I intend going to Italy, and shall be obliged if some of your correspondents will inform me as to their experiences with hand cameras which they have used, especially the disadvantages, and also what they consider the best size plates for such cameras.

Last year I used a Kodak with success. It was light and handy, always available, and required no adjustment, but it

gives very small pictures, and I am a very poor hand at stripping films.

I think a hand camera should be unobtrusive, light, and always ready for use; the shutter should be available both for instantaneous and time exposure. If with plates, it should be able to give at least a dozen exposures, with a re-lay if necessary.

—Yours obediently,

LEWIS M. BIDEN.

* * * *

CROYDON CAMERA CLUB.

SIRS,—I send you a few lines to say that the proposed Croydon Camera Club is making steady progress, and I am now completing arrangements for holding a public meeting of those who favour the movement, when I hope we shall be able to announce the enrolment of a goodly number of members. The date of meeting is not yet fixed, but will most likely be about 27th inst.

Let me again urge upon all who have the interest of photography or their own interest at heart, to strengthen my hands by at once adding their names to the list of those who approve the project.

There are several earnest workers in Croydon who are holding aloof until they see "which way the cat jumps." At present pussy is jumping in the direction of success, and if those above alluded to will take heart and lend their aid, they will "make assurance doubly sure."

I am glad to say that several gentlemen whose avocations connect them with photography are giving the project a hearty support, *e.g.*, Messrs. Wratten and Wainwright write that they will be pleased to do whatever may be in their power to promote the usefulness of the society.

I have several similar cordially worded assurances from other firms, but it is to the amateur that we look for the life and spirit of the society; and as he will reap the chief benefits, let him not, in the days of striving, shirk from giving a hand to those who are working to found this much-needed society. Of course many amateurs are helping, but we want still more.—Yours very faithfully,

H. MACLEAN, F.G.S.

February 10th, 1890.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

WEIGHTS AND MEASURES.

(Continued from page 70.)

MEASUREMENT of liquids requires care in order to obtain accuracy. All liquids which wet glass have a concave surface, or *meniscus*, the concavity being greater the narrower the vessel. The reading should be taken from the lower point of the curved surface. Liquids like mercury, which do not wet glass, have, on the contrary, a convex meniscus, and

FIG. 8.

FIG. 9.

the reading is taken from the highest point of the curve. When making a measurement, the vessel containing the liquid must be held or supported in such a way that it is quite perpendicular, and the eye of the observer must be exactly on a level with the meniscus. If the eye is above or below the meniscus, the reading of the graduation will be inaccurate (fig. 8). It is best to start with the eye above

the meniscus, so that the far edge of the liquid is visible (fig. 9, A), and then gradually lower the eye until the front edge of the liquid just cuts off the back edge (fig. 9, B). The eye is then level with the meniscus.

FORMS AND PROPERTIES OF MATTER.

MATTER is anything which occupies space and has weight, or, in other words, anything which has a real objective existence. All the various forms of matter which we see around us are distinguished from one another by differences in their physical properties, such as form, colour, and relative density, and differences in their chemical properties, that is, in their tendency to alter in composition either alone or when brought into contact with other bodies.

Matter is generally said to exist in two states, *solid* and *fluid*; and bodies which exist in the first state are spoken of as *solids*, whilst those which exist in the second state are termed *fluids*. Fluids are subdivided into *liquids* and *gases*.

Solids are characterised by rigidity, which enables them to retain their own shape without any support and to offer more or less resistance to any attempt to alter their shape. The degree of rigidity varies widely; it is very great in the case of iron, less in the case of wood, much less in the case of lead. Solid bodies which have acquired a definite geometric form spontaneously, and without outside mechanical agency, are said to be *crystalline* (Gk., *kryсталλος*, ice); solids which have no definite geometric form and which do not form part of animal or vegetable structures are said to be *amorphous* (Gk., *a*, without; *morphe*, form).

Fluids, on the other hand, have no rigidity, and consequently have no shape of their own, but take up the shape of the vessel in which they are contained. One essential difference between *liquids* (such as water, oil, and alcohol) and *gases* (such as the air or ordinary illuminating gas) is as follows. If a small quantity of a liquid is put into a large vessel, it only partially fills the vessel and there is a distinct line of separation (meniscus) between the part of the vessel which contains the liquid and the part which does not; if, on the other hand, a quantity of gas is introduced into a vessel of any size, whether large or small, the gas in time spreads itself quite uniformly throughout the vessel, and there is no line of separation between a part of the vessel which contains gas and a part which does not. Liquids yield so little to pressure that they are practically incompressible, whilst gases, on the other hand, are readily compressible, but if the pressure is removed resume their original volume. The former are commonly spoken of as *incompressible fluids*, and the latter as *compressible fluids*; this is the second important difference between them.

Liquids differ widely in their degree of fluidity, some, like water, alcohol or ether, being very fluid or *mobile*, whilst others, like glycerine or treacle, are thick and *viscous*, and approach more nearly to solids. The distinction between solids and liquids is one of convenience rather than one which actually exists. There are substances which have some of the properties of liquids and some of the properties of solids (*e.g.*, india-rubber, pitch), and might be placed in the one class just as well as in the other. Solids can, in fact, be converted into liquids, generally by the aid of heat, and *vice versa*; and in a similar manner liquids can be converted into gases, and *vice versa*. In some cases this change is very gradual; in others (and always in the case of liquids and gases) it is very rapid indeed.

Solid bodies differ in form and structure, hardness, colour, opacity to light, odour, relative density, and fusibility. Some melt and become liquid when very gently

heated, others only when very strongly heated, whilst many solids will not melt even when very hot indeed.

EXPERIMENT 3.—Melt about 1 oz. (30 grms.) of sulphur or brimstone in a porcelain crucible or a boiling tube over a low Bunsen flame, stirring it all the time with a glass rod. When about three-quarters of it is melted, carefully introduce into it a chemical thermometer capable of reading to not less than 150° centigrade or 300° Fahrenheit. Continue the heating, stirring the sulphur carefully with the thermometer, and keeping the bulb of the latter immersed in the melted sulphur. If the heating and stirring are properly done, the temperature as indicated by the thermometer will remain the same so long as any of the sulphur remains solid, but as soon as the whole of this is melted, the temperature will begin to rise if the heating is continued. *Observe and note the temperature.*

EXPERIMENT 4.—Make a precisely similar experiment and observation with some solid paraffin.

The *melting point* of a substance is the temperature at which it passes from the solid to the liquid state. Experiments 3 and 4 prove—(1) *During the process of melting, the temperature of a substance remains constant*; (2) *Different substances have different melting points.*

EXPERIMENT 5.—Heat a small quantity of starch gradually in a crucible or test-tube. *Observe* that it blackens and changes, but does not melt.

EXPERIMENT 6.—Treat some ferrous sulphate (protosulphate of iron) in the same way. Note results.

Many substances undergo chemical change before they melt, or whilst melting.

EXPERIMENT 7.—Put some clean dry sea-sand in a crucible, and make it as hot as possible with a Bunsen flame. *Observe* that it does not melt, and undergoes no apparent change.

Many other substances neither melt nor undergo any apparent change even at a comparatively high temperature.

Liquids differ in mobility, relative density, colour, odour, and volatility or tendency to pass into a state of vapour. The boiling point of a liquid is the temperature at which it passes freely into vapour under a specified condition of atmospheric pressure.

EXPERIMENT 8.—Pour half a fluid ounce (10 c.c.) of water into a small dish, and the same quantity of alcohol in a similar dish; place them side by side at some distance from any flame or fire. Examine them every fifteen or twenty minutes.

Observe that both liquids pass into a state of vapour, but the alcohol evaporates more quickly than the water. Ether would evaporate still more quickly, but its vapour is very inflammable, and if a similar experiment is made with ether it must be done at a long distance from any flame or fire.

EXPERIMENT 9.—Put a fluid ounce (25 c.c.) of water in a large boiling tube. Fit a large cork to the mouth of the tube, and cut two or three notches in the side of the cork to allow vapour to escape. Bore a hole through the centre of the cork so that a thermometer fits somewhat tightly in it, and arrange the thermometer so that its bulb is about half an inch above the liquid in the tube but does not dip into it. (Fig. 10.) Heat the liquid over a low flame so that it boils steadily, and observe the temperature every two minutes during ten minutes. Then repeat the operation, using alcohol instead of water.

These experiments prove (1) *That at the same temperature different liquids have different degrees of volatility*; (2) *That different liquids boil at different temperatures.*

Winter Work.—XIX.

By T. C. HEPWORTH, F.C.S.

HINTS ON MAKING ENLARGEMENTS.

I HAVE always been a great advocate for the use of small cameras, and have the courage of my opinions in so far that I seldom in my own practice use one larger than quarter-plate. I have pointed out on a previous page the many advantages which the possessor of a small camera has over the photographer who works big plates, and have indicated that if the producer of small pictures wants an occasional large one, it is not difficult to attain his object by magnification of the original negative. It is only now and then that a negative will be considered worthy of this honour, and care should be taken that there is no mistake here, for a poor picture will look all the poorer when its defects are magnified. On the other hand, a negative which is full of detail, but which from some cause or other is too thin to yield a satisfactory proof by contact, will generally afford a fine enlargement. Especially is such a negative fitted for enlargement upon bromide paper.

Before attempting to enter upon the work of enlarging photographs, the operator should determine whether he wants a single positive from his negative, or whether he requires a large number, because upon the settlement of this question depends the shape which his work will assume. If one or two copies only are required, the bromide paper process is the one to adopt; but if, say, a dozen or more enlarged positives are wanted, it is far better to make in the first instance an enlarged negative, and then to print from that as many positives on paper as may be required. An undoubted advantage in this latter method of procedure is found in the circumstance that with such a negative we are not confined to one method of printing, but can adopt any we like, from fugitive albumen to permanent platinotype.

In carrying out any operation, it is obviously advisable to benefit by the experience of others by endeavouring to imitate the methods adopted by successful workers. But if we apply this method to the subject of enlarging, we are at once met with a difficulty, for the firms who devote themselves to this class of work by no means conduct their operations in the same way. One or two use daylight; another employs the lime-light, while at least one other uses the electric arc-light exclusively. For obvious reasons, daylight need not be considered here, and it is as well that such should be the case, for it is perhaps the most inconstant source of light that we can employ for the purpose. The lime-light is far more serviceable, and now that oxygen is obtainable commercially, it is within the reach of all. The electric light must for the present be discarded, but in the near future it will possibly be more easily accessible than any other luminant, and most certainly it is the best that can be had for the purpose of enlarging photographs.

If we require to produce an enlarged negative, we must first of all procure a good transparency on glass, which may be of the same size as the original negative, or smaller or larger according to the conveniences which we may have at hand for producing it. In another work* I have described a method of enlarging, which I originated, in which very small positives are employed, and by which I obtain the best results. But the method is only applicable by those who care to undertake the trouble of plate-making, for large chloride plates are employed which are not obtainable commercially. The general worker will be obliged by circumstances to use bromide plates for his enlarged nega-

* "Book of the Lantern." Hazell, Watson, and Viney, Ltd. 1, Creed Lane, Ludgate Hill, E.C.

FIG. 10.

tives, and he will do well to eschew those of a very rapid description.

The positive may be produced by any of the well-known processes, but it must not be the kind of positive which is best for the lantern. Exposure and development must be carried far enough to coax every bit of detail out of the original negative, and if a slight veiling of the lights is produced in the effort to do this, it does not in the least matter, as it would in the case of a lantern slide, for we do not want a pretty positive, but one which will yield us a good negative. We have an analogous instance in the case of a pretty black and white negative, in contradistinction to one which is rather yellow than black. The first will give us a hard positive, while the less ornamental specimen will afford us one rich in exquisite gradation of tone and full of detail. It is better to produce such a positive by means of the camera, and one or two forms of instrument suitable for making lantern slides have already been given. Failing one of these, two ordinary cameras can be called into play, the lens of one pointing into the open front of the other.

There is a way of making an enlarged negative direct from a smaller negative without the intervention of a positive image, and although this method has been known for some years it seems to be very seldom practised. The reason of this neglect is doubtless partly owing to the uncertainty which is sure to attend first attempts, and partly to the circumstance that certain plates, particularly those having abnormally thick films, are unsuitable, and give poor results. The process, which I will presently describe, should not be attempted unless the lime-light be available, for one element of success is represented by a very long exposure—an exposure, in fact, which would mean ruin to an enlargement produced in the more ordinary manner.

The kind of plate used is gelatine bromide thinly coated, as already indicated, and its development must be brought about by the ferrous-oxalate method. The exposure must be considerably longer than the normal, so that when the developer is flowed over the plate the image shall appear quickly. Never mind fog or darkness, but develop until the picture is seen as a positive on the glass side of the plate. After development give the plate a very thorough washing under the tap, and then bleach it in the following solution:—

Potass. bichromate	..	..	2½ drs.
Water	..	..	3½ ozs.
Nitric acid (chemically pure)	..	..	1¼ "

Dilute before use with 15 parts of water.

Wash the plate once more after this bleaching operation, and resensitize it by flowing over it repeatedly in a dish or whilst held in the hand the following alkaline solution:—

Water	..	..	7 ozs.
Ammonia bromide	..	..	1 drm.
Liq. ammonia fort.	..	..	1 drm. 8 minims.

The plate is now exposed to brilliant white light for from two to six seconds, and is redeveloped with the same ferrous-oxalate solution which was used in an earlier stage of the process. After another washing, the negative is fixed in the usual manner, and cleared if necessary with acid and alum. It may be noted here that a reversed negative will result if the two films during the first exposure in the enlarging apparatus are so placed that they face one another. Reversed negatives so produced would be invaluable if the subsequent positives are to be made by the carbon method. But for other methods of printing a reversed negative is not required, and therefore the original must during exposure be placed with its back towards the larger plate, or the latter must turn its back to the original.

This process in careful hands will yield an enlarged negative, which cannot easily be excelled, but it requires practice and very careful attention to details. The longer the time occupied in applying the ammonia solution to the large plate the more sensitive it will become. But it is quite impossible to give more definite directions than I already have as to time of secondary exposure. This must be learnt by the experience which will be gained after the sacrifice of a few plates.

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

APPARATUS.

(Continued from page 73.)

Hints Concerning "Dark-Slides."—In many patterns of cameras the "double-backs" are made to slide into their place, but this arrangement is not to be recommended. The groovings frequently become, from wear and tear, or from a shrinking of the wood, the points where light can creep in; or, in the other event, a swelling of the wood from atmospheric moisture will so tighten up the sliding parts that considerable risk will exist of moving the camera out of position when adjusting the back. The purchaser of a camera is advised to order the backs to be so fitted that they can be slipped into a recess made in the grooving at a point near the correct one for them to occupy, and then by a slight movement they can be pushed "home." This simple device is the one now generally adopted in all first-class cameras, and is probably the best scheme yet discovered for connecting the double-back therewith.

In the American cameras, to which reference has already been made, the focussing-screen is loose and has to be lifted out of its place for the substitution of the back. This is done by placing it in position, and trusting to a spring or catch keeping it so closely in contact with the camera frame that all light is excluded. Nothing could be more simple, but it cannot be relied upon, for very evident reasons. The focussing-screen being a loose part, it becomes a nuisance, and this feature alone is enough to justify would-be purchasers refusing a form of camera in which this defect exists, whether it is of English or American design.

It is of the utmost importance, if good work is aimed at, for all the "dark-slides" belonging to a camera to be so accurately adjusted that when any one of them is placed in position for an exposure, the sensitive plate is brought into exactly the same place in every part as the focussing screen formerly occupied. To find out if there exists any want of coincidence between the sensitive surface of the plate and the roughened side of the ground-glass, the camera should be set up and some printed matter sharply focussed; then without disturbing the position, the dark-slide, containing in one department a piece of ground-glass, should be inserted. By drawing out the two exposing shutters the image on the glass can be examined, and if there is any deviation in the sharp appearance of the image, the fact that it is not in the same register becomes evident. This test should be made with both sides of each "double back."

To prevent some of the dust which may be contained in the dark-slide settling on the plate, Captain Abney recommends painting the interior over with glycerine, which, by remaining moist, attaches the particles floating about. In countries where dust and sand exist in excess, the

adoption of this valuable hint will be found to be a very beneficial measure.

As so much in photography depends on the double-backs fulfilling their office in a perfect manner, care should be exercised in storing or handling them; keeping them wrapped up in cases made of baize or other suitable material, is a good way to preserve them. If this method is adopted, each bag should be numbered in some way with the same numerals as those borne by the double-back for which it is intended.

A *Roll Holder* is a most useful piece of photographic apparatus, and an extremely ingenious one, which was first brought to public notice by Mr. A. Melhuish some thirty-five years ago, but the idea has since undergone considerable development by the Eastman Company. By the aid of a roll-holder a continuous band of paper or any flexible film coated with sensitive gelatine emulsion which has been wound on to a roller can be employed for the creation of negatives. For this purpose the film is unwound in the slide from the holder in lengths equal to the size of plate for which the holder is designed, and after exposure is rewound on to another roller called a "clamping reel." In this way fifty or more successive exposures can be made without resort being had to a dark-room to effect that constant changing the employment of glass plates or cut sheets of any description necessitates when they are carried in the ordinary dark slides. The roller slide has also an advantage over any "changing back" in its compactness; also in the fact that it enables a larger number of exposures to be made, and is less liable to get out of order. Its lightness, and the lightness of the rolled film used with it, besides making it a very desirable adjunct of the traveller's kit, confers advantages which are much to be appreciated in all hand-camera work.

The form of a roll-holder is illustrated below. The special design chosen for this purpose is the well-known

one called, after its inventors, "The Eastman-Walker Improved Roll Holder." It is attached to the camera when required for use in exactly the same way as an ordinary dark-slide.

Within the compact case, which is said to be made of well-seasoned mahogany, jointed by specially made machinery,

besides the two rollers already referred to, several necessary contrivances are to be found existing, and the mechanisms and the way their work is accomplished should be thoroughly mastered by all possessors of a roller slide. This knowledge is easily acquired, for the whole thing is of the most simple character, and a "dummy" spool of plain paper is generally supplied for experimental purposes. There exists a

device for creating an *automatic tension*, whereby the film is kept stretched flat and smooth; also an *audible and visible indicator* which enables the operator to be assured by both sight and sound that each exposure has been correctly wound off, and a fresh length placed in position. The film itself is punctured by an *automatic perforator* in such a manner that no mistake need be made when the roll is being cut up for development. On the margin of one side, each revolution of the spool is marked, and on the other the subdivision of each exposure.

Hints respecting Roll-Holders.—Practice inserting the "dummy roll" in daylight until sufficient skill has been acquired to enable the same performance to be accomplished in the dim recesses of the dark-room. When loading the holder don't forget to throw back the pawl that produces the required tension. When inserting a fresh roll, by turning the revolving bar that communicates with the indicator, and over which the film has to travel to a point just before that at which an exposure is registered, all waste of material is avoided, for a mere tightening of the film will bring the indicator into the required position for starting its registrations. Unless this precaution is adopted, a fourth of an exposure can be wasted every time the film is cut, or a fresh attachment has to be made, and as there is very little allowance for waste at the end of the roll, an inch of film saved may give the operator an exposure which otherwise would not become serviceable. Make it a rule to always mark with a pencil the dividing lines of the first exposure when preparing the holder for service. In drawing out the slide when an exposure has to be made, do so by keeping it in a parallel position; and again when returning it do the same. If held in a slanting position, a corner goes in first, and by holding open the spring, the duty of which is to keep out the light, fog may result. With care this hidden spring does all it is required to do, but a little negligence may cause it to become the source of trouble. Until the manufacturers attach a small memorandum slate to the back of the holder on which the detail of each exposure can be noted, it will be found of some convenience to attach a card oneself for this purpose. By its aid the employment of the usual note-book can be dispensed with, and it is always ready to hand, which the other is not. The adjustment of a roll-holder to an ordinary camera should only be done by a skilled workman, for it is a somewhat delicate operation, as it must be brought into exact register as the focussing screen. No tampering with the framework of the camera should be permitted, for then the "double backs" may be thrown out of coincidence.

(To be continued.)

WALTER TYLER'S CATALOGUE OF LANTERNS AND SLIDES is one of the most complete we have seen. There are illustrations and prices of lanterns of all kinds, and no less than 160 pages devoted to the titles of slides.

MESSES. PERKEN, SON, AND RAYMENT.—The following notice has duly appeared in the *London Gazette*:—"Notice is hereby given that the partnership heretofore subsisting between us the undersigned Louis Edmond Perken, Frederic Louis Perken, and Arthur Rayment, carrying on business as manufacturers and importers of optical and scientific instruments at No. 99, Hatton Garden, and elsewhere in the county of London, under the style or firm of Perken, Son, and Rayment, has been dissolved by mutual consent, as from the 31st day of December, 1889. All debts due to and owing by the said late firm will be received and paid by the said Frederic Louis Perken and Arthur Rayment, who, with Edgar Theodore Perken, the younger son of the said Louis Edmond Perken, will continue to carry on the same business at No. 99, Hatton Garden aforesaid, in partnership, under the same style or firm. Dated this 24th day of January, 1890.—L. E. PERKEN, FREDERIC LOUIS PERKEN, ARTHUR RAYMENT."

Competitive Papers.—No. XII.

ENLARGEMENTS.

Second Prize — CLEMENT J. LEAPER, F.C.S.

An enlargement is, as every photographer knows, a positive made from a negative smaller than itself. Presuming that the enlargement is to be on paper, three methods can be employed to prepare it: (1) We may make an enlarged transparent glass positive from the small negative, and a negative by contact from this, from which negative prints may be obtained by any process. (2) We may make a glass transparent positive by contact from the original small negative, and use this to obtain an enlarged negative, or (3) We can make an enlarged paper positive direct from the small negative.

We shall in this paper deal with only the second of these methods, the first one being defective in principle, expensive, and difficult to carry out, and the third being outside the scope of the present paper.

The optical principles upon which the making of enlargements depends, claim our consideration first. These principles are not difficult to understand once the action of a lens in forming an inverted image is understood.

Everyone who has used a camera knows that in focussing an object on the ground glass, the nearer we are to that object the more we have to increase the distance between the lens and the ground glass, and the larger the image on the ground glass becomes. This increase in the size of the image does not necessarily stop when we have racked out the camera to its fullest extent. Had we provided the necessary extension we could rack out the ground glass until we got an image as large as we please.

This is the fundamental principle involved, special arrangements being made merely to facilitate work. In taking a negative, the object photographed may be considered as an extremely large (by comparison) image formed at one of the conjugate foci of the lens, whilst a much smaller image is formed on the ground glass situated at the other conjugate focus.

Since these two foci are interchangeable, it follows that the lens which has taken the negative will also serve to enlarge the same negative (theoretically at least) to a size equal to the original.

We commonly employ stops in taking negatives, and their use in making enlargements calls for some remarks. When making negatives we use stops for two purposes, viz., to compel objects situated at different distances in front of the lens to form images at the same distance behind it (depth of focus) and we also use them to gain marginal definition, even if the object photographed be practically in one plane. Since, in enlarging, the object (negative or positive) is already in one plane, the sole use of the stops is to get marginal definition.

For many reasons we endeavour to reduce the exposure to a minimum when enlarging, and therefore always seek to employ as large a stop as possible. This workable aperture will really depend upon the circle which the lens used with any particular stop will then cover with perfect sharpness. If we are enlarging a vignetted portrait head, for instance, we can use the lens full aperture, as any good lens will cover, full aperture, a circle occupying only one-quarter of the plate the lens is made to work with.

If, however, the negative must be enlarged to the margins, then a small stop becomes an absolute necessity.

In enlarging, the *form* of the image is precisely the same, no matter what angle the lens includes—of course the wider the angle (shorter focus) of the lens, the nearer it will be to the ground glass and to the sensitive surface, and the narrower the angle (longer focus) of the lens the further will it be from both of these.

It would seem from this that short or long focus lenses can be used indiscriminately, but in reality such is not the case. Long-focus lenses possess several advantages for this class of work. In the first place a long-focus lens possesses *with the same aperture* better covering power than a short-focus one, and in the second place the image yielded by it is much more evenly illuminated. The first advantage conduces to rapidity in working, and the latter is too obvious to need comment.

In taking a negative we so arrange matters that the view it represents is properly lighted, and the negative is a counterpart of the lights and shadows of the original. When enlarging from

such a negative we must insure that it is lighted evenly (so that the enlargement shall be a counterpart of the original) and as strongly as possible (so as to be able to make the enlargement in as short a time as possible). There are two methods of lighting a negative to enlarge from it, viz., by daylight and by artificial light. We shall consider here only the first of these. And so far as apparatus is concerned, we may make our enlargement in an enlarging camera, or in the dark-room itself used as a large camera obscura.

We require in an enlarging camera a body capable of extending to a sufficient length, and arranged on a firm baseboard (to avoid vibration.) One end of the camera is provided with ground glass and a single back with carriers to hold different sized plates, and the other end carries the lens pointing towards the negative to be enlarged from itself, held in a carrier like a camera front, viz., capable of horizontal and vertical motion.

This camera can be used horizontally, in which case a reflector is placed behind the negative, or tilted at an angle so that the negative points towards the sky.

The subjoined sketch represents the entire arrangement:

A B, negative holder, capable of to and fro motion; C, lens fixed in front of enlarging camera; F, ground glass or carrier to hold sensitive plate.

The dimensions of the apparatus will depend upon the focus of the lens employed, the size of the negative to be enlarged from, and the size of the enlargement itself.

Supposing that we employ a lens of 8-inch focus and wish to enlarge from half-plate to a minimum of 10 by 8, and a maximum of 15 by 12, the following table gives us the required information:

Size of Enlargement.	Distance in inches from	
	Lens to Ground-Glass.	Lens to Negative.
10 by 8.	20 $\frac{4}{13}$	13 $\frac{1}{2}$
Half-plate to ... 15 by 12.	26 $\frac{6}{13}$	11 $\frac{7}{13}$

Allowing for the necessary adjustments, we see that under the given conditions the upright A B must be capable of sliding to and fro from 11 to 13 $\frac{1}{2}$ inches from the lens, whilst the ground glass must admit of being racked in and out from 20 to 27 inches.

Two square wooden bodies each 15 inches long, one (M D) rigidly fixed, the other (E F) sliding in and out, will therefore answer the purpose. This will leave three inches of overlap at M when the camera is racked out to its fullest extent. The boxes may be very roughly made, but should, of course, exclude white light, and be blackened inside.

The best way to use the enlarging camera would be to place it on a table, and so tilt it that the light reflected from the sky would pass through the negative at A B. The amount of tilt necessary need not be very great if access can be had to the upper windows of the house. Failing this, a reflector should be placed behind the negative at an angle of 45°, and so arranged as to reflect white light through it. A piece of plate-glass *silvered on the front*, is the best to employ for this purpose, but a piece of opal glass or even of white cardboard, answers very well.

When about to make an enlargement we begin by making a small positive from the original negative. This is made by placing an ordinary slow dry plate behind the negative in a printing frame, exposing the two to very weak daylight, and developing, etc., in the usual way. Care must be taken to give such an exposure as will yield a negative full of detail, and not to push development too far. The exposure is best effected with the

printing frame at the bottom of a box, with blackened sides, at least two feet high. The object of this arrangement is to secure maximum sharpness, much of which would be otherwise lost.

The finished positive is next placed in position in the enlarging camera, and the focus secured in the usual way, the final focussing being done with a magnifier placed at the back of the ground glass. The lens is then capped and the slide removed to the dark-room and provided with a plate. The slide is then put in position and a light framework of cardboard blackened inside placed between the negative and the lens so as to exclude stray light, and under this the hand removes the cap of the lens and exposes the plate.

Exposure over the plate is developed as usual, and yields, of course, an enlarged negative, from which positives can be printed by any method.

If the dark room is sufficiently large and conveniently situated, it may be made to serve the purpose of an enlarging camera itself.

We will suppose that the room faces north, and is so lofty that the window has an unobstructed view of the clear sky.

In such a case it is merely necessary to provide a frame fitting a portion of the dark-room window, and capable of holding a glass positive. From the portion of the window occupied by this frame, the ruby fabric or red glass will have been removed, so that the positive is opposite the clear sky, and this frame must be so arranged that when the whole is in position no white light finds admission except that which passes through the positive. Fitting tightly over this frame is a camera body, carrying the lens in front, and capable of being moved in and out in the usual way. In the example taken previously the lens should be 11 inches from the positive, and the camera should rack out to 13½ inches. In front of the lens an easel carrying a drawing board travels backward and forward on a tramway. The figure will explain this arrangement.

A B is the dark-room window from which all white light is excluded, except what passes through the positive at C; D is the camera body, with the lens at E; and F the easel moved backwards and forwards on a tramway G.

The drawing board must be parallel to the positive at C.

A hole 2 ins. square is made in the centre of the drawing board, and piece of plain glass secured with drawing pins to the side of it, facing the lens and so as to cover the aperture. The use of this will be apparent later on.

To employ the apparatus, the positive is placed in position, and a rough focus secured on a piece of white cardboard the same size as the enlargement, fixed to the drawing board by five drawing pins, two at the bottom and one at each of the sides. The rough focus secured, the cardboard is removed, leaving the two pins at the bottom and one at either of the sides in their places, and the final focussing done with a magnifier placed at the back of the piece of plain glass. This latter is now removed, the lens capped, and an ordinary dry plate placed in position and exposed, the drawing pins left in position, ensuring that it occupies the same position as the cardboard. This plate is then developed and fixed in the usual way, and yields an enlarged negative. A black blind should be arranged so as to exclude almost all red light during focussing and exposure.

If the window does not face north, or if enlargements have to be made whilst the sun shines on the window, a piece of ground glass must be used behind the negative so as to moderate the light.

If the dark-room is so situated that the window is more or less obstructed by buildings or trees, two expedients can be adopted, viz., a reflector may be placed at an angle of 45° outside the window or the negative holder, camera body and easel can be arranged on a board, and so tilted that the negative points to the clear sky.

If the latter plan is adopted, the frame must be fixed at the top

of the window to allow the easel to be moved far enough away. The amount of tilt to be given to the board will depend, of course, on local circumstances, but need never be very great. The board carrying the easel should be made removable so as to permit the room to be employed for other purposes.

If a reflector is used, it must be large enough to illuminate the negative viewed from the nearest position of the lens. If the eaves of the house do not project very much, the lower edge of the reflector may be near the negative, but if the eaves project, it will have to be placed further off and must in that case be made larger. The proper size for the reflector is a matter easily determined by experiment, and is ascertained in the case in point by placing the eye 11 inches from the carrier with its half-plate aperture, and ascertaining by trial what size a piece of cardboard placed outside at an angle of 45° and evenly illuminated (i.e., out of the shadow of the eaves) must be to cut off all direct light.

Evidently the nearer the lens is to the aperture in the dark-room window, or in other words, the shorter its focus, the larger must the reflector be made. This fact furnishes another argument in favour of the employment of long-focus lenses for making enlargements.

Our Contemporaries at Home and Abroad.

Anthony's Photographic Bulletin (New York), referring to "Toning and Toning Baths," says, "A toning bath that works rapidly will give blue tones; one that works slowly, red or brown tones. This comes from the fact observed long ago that fine metallic gold precipitated rapidly is a decided blue colour, while gold that is precipitated slowly is red. It therefore follows that to give a purple tint to albumen prints, the original washed prints should be a little reddish, and a gold toning bath should be used that works rapidly. If, on the other hand, reddish or brown tones are desired (as for landscapes), then a slow-working gold bath should be used." It also says, "The new eoside of silver plates has been used to make negatives of a rare variety of orchid, showing different shades of yellow, blue, and green. Using the ordinary pyrogallol developer, the results are pronounced most excellent." Articles: "Photography from a Woman's Standpoint," "The Invention of Autotypy," "The Japanese through the Camera," "At Home Portraits and Groups," "Testing Lenses," "Photo-Micrography," etc.

British Journal of Photography, in an article on "Matt Opal Glass," says, "We may point out one very simple plan of treatment which is sometimes a real improvement to a picture; it is well enough known to professionals. It consists simply in backing the opal with a piece of orange or other coloured paper, the extent to which a piece of 'white' opal can be altered in tone according to the colour of this backing material being remarkable to those who have never before attempted the experiment." In another note it says, "Having developed a plate with a very much discoloured solution, containing eikonogen and sodium carbonate with a trace of potassium bromide, it was found on fixing to be deeply marked with an opalescent brown stain, equal to the worst pyro stain. Placed to soak in a dish, it was found in an hour or two's time that the shadows of the negative were beautifully clear and colourless, while the water had assumed a muddy-yellow tint." Articles: "The New Benzoline Lime-light," "The Probable Permanence of Plain Paper Prints," "The Explosion of a Gas Cylinder," "On the Control of Density of Negatives," "Practical Interpretation of the Law of Conjugate Foci," etc.

Photographic News, speaking of "Lights from Explosions or Detonators," suggests that the best plan is to use several lights simultaneously, and the best method of "igniting them by means of a Wimshurst electrical machine, arranged to give sparks at will between disconnected parts of an otherwise complete metallic circuit. Some explosive powders such sparks will scatter and not ignite, but placing a piece of wet string in the circuit usually overcomes this difficulty." Among its notes the *Photographic News* says, "No one would wish to lessen the glory of Daguerre by a jot, but is there not rather a tendency to overdo the homage which is being paid to his memory all over the world? In the universal pæan of praise which is being sung, one is apt to forget the name of Talbot. It is no question of

rivalry between Talbot and Daguerre which we desire to raise, but rather a reminder that, while Daguerre's process is practically extinct, the germ of the Talbotype yet remains incorporated in our everyday work." Articles: "Photography in Germany," "Ernst Schering," "Self-Luminous Transparencies," "Some Experiments with Eikonogen," "A Photographic Fiend," etc.

Photographische Notizen (Vienna) contains useful notes on "Indoor Photography with the Flashlight."

Photographic Times (New York), in an article on "Side-light Portraiture," by Miss Catherine W. Barnes, says, "There is a class of critics who can see nothing good in a photograph unless it is out of focus, but it does not seem impossible in my mind to steer between Scylla and Charybdis and have a portrait sharp and soft in the proper places, and not a general fuzziness. Poor photographic work surely ought not to be called good art work, but a good photograph is a work of art as well as science." Articles: "American Films for Process and Show Work," "Making Cyanotype Transparencies and Lantern Slides for Light-struck Gelatine Emulsion Plates," "Blisters—How they are caused and cured," "Repairing Broken Negatives," etc. The accompanying illustration is from one of Miss Barnes' negatives taken with a side-light.

Photography, speaking of "Density of Negatives," says, "Every photographer knows that there are some negatives very obviously too thin, but which are not beneficially affected by prolonging the application of the developer. In short, the density desired cannot always be got by development, because sometimes it will not come, and oftener because there is no reliable means of telling when it has been obtained until after fixing." In an article on "Printing Papers," it says, "Nature is not glazed. It may be argued in opposition, neither is nature limited to certain sizes, nor all in one plane, or of one colour, and that if we admit what is unnatural in one respect, why not in others? The answer is distinct enough. Our art is not a model. It is the best expression possible to us upon a flat surface of what the mind apprehends in nature, and we must not falsify where falsification can be avoided." Articles: "Photographers' Benevolent Association," "Collodio-Bromide Emulsion for Lantern Slides," "Astronomical Photography," "Tinting Lantern Slides," etc.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, February 6th, a paper contributed by Sir David Salomons was read. Mr. E. R. Shipton was in the chair. The paper contained formulæ for ascertaining exact distance of lantern from screen when a certain amplification with a given lens is desired, and for finding focal length of lens to be employed for a fixed distance and enlargement. Some remarks upon the paper were made by Mr. Elder and Mr. Davison.

An exhibition of lantern slides followed—views in the Netherlands by Messrs. H. M. Elder, E. G. Spiers, and W. A. Greene being first shown. These were succeeded by a set of New Zealand scenes by Mr. Wray Palliser, and the first club loan collection of slides, sixty in number, contributed by various members. Other sets were shown by Messrs. Andreae, Fraser, Harding, FitzPayne, and Shipton, nearly 300 slides in all being brought up by members for exhibition. At the commencement of the meeting the Hon. Secretary handed round an instrument (sent up by Mr. Dresser) called the "lanternoscope"—an apparatus devised for the effective viewing of lantern slides. In form and use the lanternoscope is like the stereoscope, but without the means of securing stereoscopic effect. The transparency is viewed through a magnifying eyepiece, the picture having behind it a piece of ground glass for diffusing the light from the lamp. There was also exhibited (sent by Messrs. Hinton and Co.) a large, unusually effective photograph of the Eiffel Tower, taken by M. A. Pepper, of Paris.

The paper on Thursday, February 20th, will be one communicated by Mr. W. K. Burton, "On one or two of the Tenets of the Naturalists." Meeting at 8 p.m.

Societies' Meetings.

BATLEY AND DISTRICT PHOT. SOC.:—The ordinary meeting was held at the Exchange Coffee Tavern, on the 16th inst., when several stereoscopic and lantern slides were placed upon the table by Mr. Naylor for inspection. The following gentlemen have been elected officers for the ensuing year: President, Mr. Percy Sheard; Vice-President, Mr. Harry Spedding; Hon. Sec. Mr. Charles Naylor (Clark Green Street, Batley).

BRECHIN PHOT. ASSOC.:—The usual monthly meeting of the above was held on the 5th inst., Dr. Anderson, Vice-President, in the chair. The chief business of the evening was a paper by Wm. Stewart, junr., on the various methods of working bromide and Alpha papers. Samples of work on various brands of paper developed with pyro, ferrous oxalate, and hydroquinone were handed round, and Mr. Stewart then exposed and developed a few prints on samples of both papers. Messrs. Fry and Sons kindly sent on samples of work on their bromide paper, and a specimen print on their new "ivory celluloid film," which were all much admired. It was arranged that the next meeting take the form of a public lantern entertainment, the Secretary intimating that he had arranged for parcels of slides from the Editors of the AMATEUR PHOTOGRAPHER and others. Votes of thanks to Mr. Stewart and the Chairman brought the meeting to a close.

DUNDEE AND EAST OF SCOTLAND PHOT. ASSOC.:—On the 6th instant the first popular lecture this season under the auspices of the above Association was given to a crowded audience in the Kinnaird Hall, by Mr. J. W. McCall. The scenery illustrated was that of Orkney, Shetland, and Greenland, the pictures having been prepared by Messrs. Valentine and Sons. A large screen was used, some thirty feet square, and special lantern arrangements had to be made. Starting from Kirkwall, with its celebrated cathedral, the various islands were visited in turn, and the Orkney group was next shown, the audience getting a capital idea of the bold headlands and magnificent rock scenery, besides views of Lerwick, Stromness, and Scalloway, the old castles and ruins found on the various islands, and scenes illustrative of the habits and customs of the natives. The series closed with views of the Tay and Forth Bridges, several other large structures being shown by way of contrast.

GLASGOW PHOT. ASSOC.:—The fourth general meeting of the session was held on the 6th inst., Mr. Wm. Lang, jun., F.C.S., President, in the chair. The following new members were elected: Paul Rottenburg, James Richardson, C. J. Anderson, J. T. Darling; ex-Provost Clark, of Paisley, was elected an honorary member. In the question-box the following questions were found:—(1) Can anyone give any information about the explosion at Polmadie? Is there to be any public or scientific report to be made regarding the same? (2) What method of varnishing celluloid films is the best? (3) Can any one mention a formula for toning Alpha lantern plates? Regarding the first question, after some discussion, it was thought that the authorities would be sure to investigate the matter. The second question was to a large extent unanswerable. It was understood that the Eastman Company were working to produce a suitable varnish. Professor E. J. Mills, D.Sc., F.R.S., then gave a communication "Some Practical Notes," in which reference was made to eikonogen, its discovery, chemical constitution, and its role as a developer. Several interesting novelties were shown by Dr. Mills, notably a lens mounted in aluminium. Mr. H. M. Smith, representing the Eastman Company, exhibited the new Kodak, celluloid film, negative, new glass tray for developing same, etc. These two gentlemen received the thanks of the members. Specimens of a new glass etching process (Mallock's patent) were next passed round, and the proceedings closed with a series of photographs illustrative of the various Photographic Conventions, forwarded by A. Pringle, Esq., honorary member, some micrographs by the same gentleman being shown by means of Society's lantern.

HOLBORN CAMERA CLUB.—Friday, February 7th, was devoted to the instruction of beginners. The opening remarks were made by Mr. Brocas, who was followed by Messrs. Bayston, Smith, and Jones. It is to be hoped that the practical information then given will result in some good work during the coming season. On February 14th Mr. Traill Taylor will have something to say about lenses. Saturday, March 1st, the club will hold its annual exhibition of members' work, at

Anderton's Hotel, Fleet Street. In conjunction with the above will be held a Cinderella dance, tickets for which can be obtained from any member or of the Hon. Sec. (100, High Holborn); members of other clubs will be welcomed.

LIVERPOOL UNIVERSITY COLLEGE PHOT: SOC:—The fourth ordinary meeting of the present session was held on the 3rd inst. Dr. C. A. Kohn, the President, was in the chair, and after several preliminary notices, he called on Dr. J. L. Howard to read his paper on "Orthochromatic Photography." The paper, which was illustrated by lantern-slides and experiments, traced the history of orthochromatic photography up to the present time, and gave the results of the chief workers: Voget, Eder, Bothamley, etc. Dr. Howard mentioned the chief dyes used on the plates, and showed slides comparing the effects of each; he also explained the use and action of the yellow screen in orthochromatic work. Mr. Higgs then gave his results with orthochromatic plates, mentioned the dyes he used, and showed several fine photographs, taken by himself, of the lower end of the spectrum. Two fine enlargements of Prof. Rowland's spectrum photographs, and several fine photographs of nebulae and stars, by Mr. Isaac Roberts, F.R.A.S., were exhibited. Dr. J. C. Brown then gave some excellent advice to the members of the society, encouraging them to take photographs of natural objects—*e.g.*, faults in rocks, boulder stones, lightning flashes, etc.—which he said would be likely to prove of great value in furthering geology and physics. The next meeting will be on Wednesday, Feb. 26th, when Mr. Paul Lange will read a paper on "Detective Cameras."

LOUGHBOROUGH LIT: AND PHILOS: SOC:—The photographic section of the Literary and Philosophic Society gave a free evening on the 8th inst. to a number of people in the Victoria Room, kindly lent for the occasion by the Mayor. The room was well filled, a portion being reserved for the Society, and the remainder thrown open to the public. The Mayor presided, and opened the proceedings with a few appropriate remarks. A variety of local views taken by amateur photographers were thrown on the screen by the aid of a powerful lantern manipulated by Mr. J. B. Colgrove. The views had been prepared by Messrs. W. T. Tucker, J. B. Pike, F. Riley, W. C. Burder, W. Clarke, A. D. Bartlett, J. B. Colgrove. Mr. H. Pickering, of Leicester, acted as guide, and commented on the illustrations. During the evening a photo of the Mayor was taken, and subsequently conveyed to a lantern-slide and thrown on to the screen.

LUTON AND DISTRICT PHOT: SOC:—At the meeting on the 8th inst., Mr. F. E. Percival in the chair, a code of rules was adopted, and the following gentlemen elected officers: President, Cyril Flower, Esq., M.P.; Vice-Presidents, his worship the Mayor of Luton, Mr. A. Carruthers, Mr. F. E. Percival, and Mr. W. Wardill; Treasurer, Mr. W. Boutwood; Council, Messrs. H. Edwards, L. Giddings, T. Dawson, E. Howard, W. Cawdell, and A. V. Spratley; Secretaries, Messrs. Geo. Bunyan and A. Howard. The next meeting is fixed for the 24th inst., and will be a social evening, with music, etc., and there will also be an exhibition of apparatus. A paper will be read by Mr. Howard, and the members will contribute prints for mutual inspection.

NORTH LONDON PHOT: SOC:—The last meeting was held on the 4th inst., Mr. Douglas in the chair. The Secretary stated that the demonstration on "Bromide and Alpha Printing," was fixed for April 18th, and not for February 18th. Mr. Louis Medland then proceeded to give his lecture entitled "A Day at the Zoo." The lecture was illustrated by upwards of 200 lantern slides, prepared by the lecturer himself from negatives taken by him during the last two or three years. The lecture was most interesting. A hearty vote of thanks was accorded to Mr. Medland. Mr. Hudson then showed and explained the action of a new detective camera just brought out by Mr. Abraham, of Aldersgate Street. Mr. Hudson also showed a metal ring which he had had made for encircling a lens mount and preventing the stops from slipping out, and also any light from entering the slit. Mr. Mackie stated that he thought Mr. Hudson would find that several patents had been taken out for a similar contrivance. The next meeting (a technical evening) will be upon Tuesday, February 18th. Mr. A. Mackie will take the chair.

OXFORD PHOT: SOC:—The members of the above society met on Thursday, 6th inst., to see an exhibition of slides, entitled "Boston Illustrated," by the oxy-hydrogen lantern. The slides were made by the Boston Camera Club, U.S.A. Mr. Ryman Hall kindly undertook the reading, and Mr. Salter the management of lantern and slides. The next meeting will be held on Feb.

20th, when there will be a show of members' cameras, together with a flash-light exhibition.

REDCAR AND COATHAM AM: PHOT: ASSOC:—At the meeting held on February 4th, the AMATEUR PHOTOGRAPHER slides were exhibited on the screen by Dr. Stainthorpe. A considerable number of members' slides were also exhibited. The "Inland Scenery" and "Seaside" series of the AMATEUR PHOTOGRAPHER were very much admired, some of the slides exhibiting a very high order of merit. A vote of thanks to the Editors of the AMATEUR PHOTOGRAPHER and Dr. Stainthorpe closed a highly successful meeting.

SHEFFIELD PHOT: SOC:—The monthly meeting of the above Society was held on Tuesday evening, the 4th instant, Mr. B. J. Taylor, the President, in the chair. There was a large number of members and their friends present, when a series of 180 slides was passed through the lantern, which was manipulated by Mr. G. Bromley. The slides had obtained prizes given by *Photography*, amongst which was a Silver Medal Series gained by the energetic Secretary (Mr. E. Beck) of above Society. There was also laid on the table "Enlargements," contributed to the AMATEUR PHOTOGRAPHER Monthly Competitions. After the usual vote of thanks, the meeting separated, having thoroughly enjoyed a very successful evening.

SOUTHERN AM: PHOT: SOC:—An ordinary meeting of this society was held on Friday, 7th. Lieut. F. W. Cobb, R.N., occupied the chair, and twelve members were present. Dr. Wardrop and the Hon. Secretary were appointed a sub-committee to make arrangements for the annual exhibition of lantern slides to members and friends, and to engage a suitable hall for the purpose. Dr. Wardrop then read his paper "Lantern Slide-making for Beginners," illustrating the various points from time to time by views thrown on the screen.

WEST KENT AM: PHOT: SOC:—The general meeting was held on the 5th inst., Mr. Grant in the chair. After the usual business, the Chairman called upon Mr. Jones for his paper "My Experience of Photography." The lecturer, starting with the assumption that the majority of amateur photographers were recruited from the ranks of professional and business men, said it was important, owing to the short time generally at their disposal, that as few difficulties as possible should be allowed to present themselves. Hence he strongly advised that all apparatus connected with the work should be of the best possible description, both as regards the camera, etc., and also the dark-room. He then dwelt upon the difficulties experienced by many beginners, and explained them. He exhibited a stand of his own manufacture, made in the form of an alpenstock. It was greatly admired for its strength and rigidity. A hearty vote of thanks was accorded to Mr. Jones. It was arranged that a short lantern show be held at every meeting for the remainder of the season. Next meeting, Wednesday, February 19th, will be the last day for sending in the lantern slides for the Society's competition.

YORK PHOT: SOC:—The President's annual address to the members was listened to with much interest, among the points touched on being the results of last season's work, and the programme for the present year, with several suggestions, which if acted upon would materially advance the society's usefulness. A lantern exhibition followed, and the slides to be sent to the Paisley Society were selected.

PHOTOGRAPHIC CONVERSAZIONE IN BRADFORD.—The first conversazione of the Bradford Photographic Society has been held. There was a large attendance of members and friends. In opening the proceedings, the President (Mr. Alex. Keighley) said the society was established in 1884 as a society of amateur photographers, and it could show a record of good and useful work, as was evidenced by its annual exhibition in the Bradford Art Gallery. During the past few years growing interest had been taken in photography, and amateur photographers had largely increased in number. The roll of membership of that society had not, however, grown in the same proportion. It was with the object of calling attention to the existence of the society that the conversazione had been projected. The aim of the society in holding the conversazione was not only to provide enjoyment for an hour or two, but to induce amateur photographers who were not already members to join its ranks. The principal feature of the conversazione was an exhibition of photographs lent for the occasion by members and friends from a distance. There was an extensive display of views lent by the Autotype Company and the Woodburytype Company, and

among other professionals by Messrs. W. W. Winter, of Derby, and J. P. Gibson, of Hexham. The amateur members of the society exhibiting were numerous. The exhibits of Mr. Forsyth were very numerous, and comprised much work of an elaborate and skilful kind. Mr. Keighley's pictures were greatly admired, as were also Mr. D. G. Law's abbey views and lake scenery. Mr. W. Halstead showed many pretty landscape photographs of small dimensions. Mr. Sonnenthal's subjects were chiefly Continental, while Mr. Scott and Mr. Leach contributed fine views of Bolton Woods and other river and woodland scenery. Transparencies and stereoscopes were shown by Mr. Forsyth. Another interesting feature was the exhibition of lantern slides by the aid of Messrs. Appleton's triple lantern. Messrs. Appleton and Mr. Grayson also showed specimens of photographic apparatus, among which were camera sets ranging from 15 in. by 12 in.

downwards, of considerable novelty. Microscopes, lent by members of the Microscopical Society, were also on view. During the interval a short programme of music was contributed. Owing to the success of the exhibition and entertainment, they were both open to the public on a second evening.

ABRAHAM'S PHOTOGRAPHIC ANNUAL, though not quite on the lines of the cheap handbooks, contains many practical hints which will be found of great use by both the young and the old amateur, and are not even to be despised by the professional. In addition there are articles on various subjects by Messrs. Lionel Clark, A. Pringle, A. R. Dresser, W. Jerome Harrison, E. J. Wall, and others. It also contains a complete list of apparatus, chemicals, etc.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.

2. Write each Query or answer on a separate sheet of paper.

3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.

4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.

5. The Editors do not undertake to answer questions by post.

6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3436. **Aristotype.**—Should be glad of opinions on the merits of fixing before toning, with regard to (1) beauty, (2) permanence, (3) speed, (4) economy—all with special reference to aristotype paper?—G. M. SAVILE.

3437. **Object-Glasses of Field Glasses.**—Are the plano-convex achromatic object glasses of a field or opera glass suitable for mounting as a rectilinear lens? The components of a rectilinear lens are usually of the meniscus form, so I have been wondering if the fact of the above glasses being planos would prevent their being converted into a rectilinear. What would be the probable full working aperture of such a rectilinear lens, when used to cover a plate equal in length to the focus of the lens?—LENS.

3438. **Changing Bag.**—Will someone kindly inform me where an inexpensive changing bag (not one to go over the head) can be obtained?—W. J. W.

3439. **Instantograph.**—Would any amateur kindly give me his personal experience of Lancaster's half-plate Instantograph, and would he kindly give me his opinion as to the quality of the lens?—CHAS. DODMAN.

3440. **Set of Apparatus.**—I am only an amateur, and I am anxious to obtain a set of photographic materials. Will someone kindly tell me what camera, lenses, etc., I should commence with (not expensive), also the best half-plates? Where can Lockyer's hydroquinone be obtained?—H. C. DURNFORD.

3441. **Rough's Detective Camera.**—Will someone give description of shutter, whether time or instantaneous? Those who have used it might say how they like it.—W. SINCLAIR.

3442. **Spoiled Negative.**—How can I remove the silver from off the negative from which I have been printing? I have soaked in water, but that seems to have no effect.—ALL SAINTS.

3443. **Toning.**—I want to know how to get the real black tone for ready-sensitised paper?—W. H. A.

3444. **Japan, Plates in.**—Regarding a trip to Japan, can whole-plates be procured at various places *en route*, and dark-rooms obtained? Some

general information on the subject would much oblige.—YENDYS.

3445. **Opals.**—I intend trying some photographs on opal. Will someone kindly tell me the best plates and toning bath to use? Is there not a special printing frame required? Any hints will be most acceptable.—BANSHEE.

3446. **Opalina.**—I wish to try the opaline process of mounting photographs on glass, and would be glad to know the best mode of making the prints adhere firmly and evenly to the glass. Should they be mounted wet, and how are the backs fastened on?—BANSHEE.

3447. **Instantograph.**—Can some amateur photographer tell me if a quarter-plate Instantograph camera is preferable with square bellows (the old pattern) than with conical? Perhaps the conical bellows are better?—A. T. J. (Stockholm).

3448. **Merveilleux.**—Would anyone inform me if the Merveilleux camera can be fitted with an Instantograph lens, and instantaneous work, etc., can be turned out with it? Must any alteration be done with the camera itself?—A. T. J. (Stockholm).

3449. **Granularity in Emulsions.**—Can anyone tell me the cause of above; how to prevent it, and how to cure when it appears?—W. B. WOODLAND.

3450. **Hydroquinone and Intensification.**—Would Mr. A. E. Venn kindly tell me what sort of hydroquinone developer he uses to darken his bleached negatives in intensifying? Some time ago I bought some hydroquinone developer in two bottles. One contained the hydroquinone, and the other the sodic hydrate, I think. Ought I to immerse the plates in both or only one?—O'M.

3451. **Lantern Slides.**—In reducing to lantern size from a 12 or 10 negative, using a Ross' portable symmetrical lens of 9-in. focus, what must be the distance of the negative in front of the lens, and of the sensitive plate behind it?—NOVICE.

3452. **Lantern Slides.**—Using wet collodion with iron or pyrogallol developer, what is the relative difference in exposure (in camera for reduction purposes) between wet collodion and the various dry plates sold for such purposes? Is collodion quickest or slowest?—NOVICE.

3453. **Bromide Papers.**—I am using Ilford bromide papers, and develop with the formula given therein. As they are saturated solutions, how do I fill up again when getting empty, and in what proportion do I add potassium bromide and citric acid to the respective solutions? Any further hints on this subject will be gratefully received by—MAX BELLOWS.

3454. **Slide Exposure.**—Will someone who has used Griffiths' lantern-slide-making camera (half-plate) give me some idea as to the exposure required, say for an average negative and ordinary lantern plates (preferably Mawson and Swan's)—(1) By diffused daylight, (2) by ordinary gas burner, as used in contact printing for quarter-plates? I shall be much obliged by the results of anyone's experiences.—C. J. E.

3455. **Hydroquinone and Intensification.**—I note in your issue of February 7th a letter from Mr. Venn, stating an infallible cure for under-exposed and under-developed plates. Will he kindly make known (1) what developer he uses for his plates, and (2) what formula of hydroquinone he uses for darkening his intensified plates? I have for long bleached my negatives with a saturated solution of bichloride of mercury, darkening with a saturated solution of sulphite of soda, and my experience was quite the reverse of Mr. Venn's, for the results were very good. However, since I began to use hydroquinone as a developer in preference to pyrammonia, my attempts at bleaching the negative have proved signal failures, and I have often thought of asking the reason for this. The negative has been half an hour, and even an hour, in the mercury solution with no visible alteration, or, at least, the very slightest.—LOLA.

3456. **Dark-Room.**—Having just moved to Clapham Junction, and living in lodgings, I am quite unable to fix up a dark-room. Will some kind reader inform me where I can get the use of same?—AMSDEN.

3457. **Shutter, etc.**—Can anyone advise me as to the best shutter for either time exposures or very

rapid work, and price, quarter-plate? Also a gas lamp for dark-room? Can he also recommend the metallic binding slips for lantern slides, lately mentioned in **AMATEUR PHOTOGRAPHER**, and, if so, tell me where I can get them?—H. J. SIBTHORP.

3458. **Water.**—I shall feel greatly obliged if someone will kindly say whether it is possible to make absolutely pure water (from London cistern water) by any method or treatment other than distillation. Would boiling, coupled with filtration or chemical treatment, answer the purpose? It is required for an invalid in quantities of three gallons per day. Any information bearing thereon will be thankfully received.—ORDNANCE.

3459. **Loan of Negatives.**—Would anyone kindly lend me some quarter-plate negatives suitable for making lantern slides from? Views and seascapes, with shipping, preferred. Postage will be paid both ways.—A. H. LIVINGSTONE.

3460. **Hand Camera.**—Will any reader kindly inform me which is the best, cheapest, and most effective hand camera in the market for taking quarter-plates?—HENRY DUNDAS.

QUERIES UNANSWERED.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3353, 3354, 3356, 3359, 3364, 3367.

17th.—Nos. 3339, 3370, 3371, 3372, 3375, 3376, 3378, 3379.

24th.—Nos. 3333, 3385, 3386, 3389, 3392, 3393, 3394.

31st.—Nos. 3401, 3403, 3405, 3406, 3409, 3410, 3412, 3414.

Feb. 7th.—Nos. 3417, 3421, 3422, 3429, 3430, 3431, 3434, 3435.

ANSWERS.

3331. **Camera on Bicycle.**—As "New Rapid" bicycle is the most rigid made, it is unsafe to carry any camera on it. I have tried several carriers, and believe there are none to be depended on. I carry my quarter-plate in case with strap over right shoulder, which leaves camera free at left side, and, therefore, no inconvenience either in mounting or dismounting from machine. The stand, which is two-fold, is strapped to cross frame on side opposite gear wheel.—ANOTHER C. T. C.

3395. **Dark-Room Lamp.**—Procure a piece of wire netting, mesh say 1 in., 18 ins. by 22 ins., make a cylinder by joining with thin wire the edges of the shortest sides, allowing a lap of 1 in.; this will give a frame work of 18 ins. high and 7 ins. diameter. Cover this with cherry fabric, allowing an inch to turn over the frame top and bottom; this may either be sewn on or fastened with Page's glue. To cover the top, cut out a circular piece of sheet zinc 9 ins. in diameter, turn over 1 in. all round, so that it may fit over the cylinder, punch holes in the centre of the cover for ventilation, and over these place an extinguisher with a portion of one side cut out. For a light use an ordinary oil lamp, which can be purchased for ninepence. To lessen the light, if necessary, stretch a piece of orange paper on a wire frame, about half the size of the cylinder, and shape it to it. This can be moved round it as required. If the red light is objectionable, use a shade over the eyes. Whatever colour the lamp, this shade is a great assistance in watching development.—A. T. NEWINGTON.

3398. **Printing-out Opals.**—The emulsion for above can be had of first-class quality from Mr. H. Pickering, photo chemist, Highcross Street, Leicester, in bottles from 1s. each. It gives any tone to deep black in ordinary toning bath.—W. B. WOODLAND.

3415. **Printing.**—Try a strong acid, applied with a tuft of cotton-wool. If that does not answer, nothing will. The stain on the negative, caused by the silver in the paper, is generally hopeless.—W. A. J. CROKE.

3415. **Printing.**—Place the negative in the hypo bath, and let it soak till paper leaves the film easily and without any force being applied; afterwards, wash thoroughly.—T. L. BUCK.

3416. Bromide Enlargements.—Expose more fully, and keep proportion of iron in the developer down: follow their instructions, formulae, etc., and watch above point, and results will be quite satisfactory.—T. L. BUCK.

3418. Bromide Enlargements.—I have often found iron stains result from the paper sticking to the bottom of the dish when the acid is poured on. It should be raised and kept moving in the acid for at least one or two minutes.—PLATANUS.

3418. Shutters.—Would Tylar's self-portrait shutter do? It seems to be the very article you require, excepting its action, which is controlled by a piece of string in place of a pneumatic ball. See his list for engraving.—T. L. BUCK.

3419. Vevers' Lens.—Vevers' R.R. lenses are very good value at the price. You might find a wide-angle doublet of use in confined situations, but other than in such use the R.R. Ilford extra-rapid act very well under ordinary circumstances.—T. L. BUCK.

3420. Lantern Slides.—The ordinary quarter-plate answers admirably for lantern work, and its advantages are too obvious for comment.—T. L. BUCK.

3423. Stains.—In absence of more definite particulars as to nature of stains, it is really difficult to advise you.—T. L. BUCK.

3423. Stains.—Try an equal solution of citric acid and alum, for strength about 14 ozs. to 20 ozs. of water, and leave in soak for about ten minutes. If this does not do, try a stronger solution; not too strong, unless the negative will frill.—W. A. J. CROKE.

3424. Grinding Lenses.—If Mr. Wratishaw will read the articles on the "Reflecting Telescope," contained in vols. 5 and 6 of *Amateur Work* (Ward, Lock, and Co., Salisbury Square, E.C.), he will lose his "great wish to grind and polish" his own lenses; but he will gain the information he wants. He could borrow the volumes from R. D.,

3424. Grinding Lenses.—I should not advise you doing anything of the kind yourself if you value your lens; but send it to an optician or the maker, who will do the necessary for you.—W. A. J. CROKE.

3425. Switzerland, Ilford Plates.—Mons. B. Baud, Rue Verdaine, Geneva, will send you any Ilford plates by post to Marat.—J. H.

3428. Waverley Shutter.—Write to Mr. J. M. Turnbull, 6, Rose Street, Edinburgh, who will not do it send all particulars as to price, etc. He could probably supply carbon sheets for dark backs, as he makes a large quantity of them for detective cameras. There is no better shutter for a hand camera than the "Waverley," as it gives full exposure, does not shake, and allows of several speeds. It is fitted to the Turnbull detective camera, and works well.—P. Q.

3428. Forth Bridge.—A. Duthie, 6, Renfield Street, Glasgow, has a good variety of above at various stages in the shop window, and would no doubt send a selection on deposit or reference.—A. D.

3432. Hydroquinone.—If "Developer" has already developed two plates, it has done quite sufficient and is nothing in your debt. If really anxious to know whether its efficacy is destroyed or not, please try it and see.—T. L. BUCK.

3433. Opals.—See answer to 3398.—W. B. WOODLAND.

3437. Hydroquinone.—The changing of colour of the developer does not detract from its powers of developing in the least. I used a developer I had in the house for months the other day, and which had turned a dirty red colour. The only disadvantage is you cannot watch your negative so well. Exposure to the air generally turns the colour of the developer.—W. A. J. CROKE.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM. PHOT.

ISAAC MBINING (Cape Colony).—Both prints of sunset are excellent effects. Such pictures here, especially if that nineteenth-century very real railway could be omitted, would be much admired. The view would make a very charming lantern slide. You should compete, not with the print sent, in our "Monthly Competitions." Shall be glad of any views of Cape scenery. There is no need, in sending to us, to mount prints.

TYRO.—It is very absurd to send untuned prints. Those received from you are almost black, and it is impossible to pass any opinion upon them. Send us some toned ones, and we will give our opinion.

COMPETITOR.—The "Enlargements" contributed to our "Monthly Competition" are now going the round of the "Societies," and we are, therefore, unable to comply with your request. Your other suggestion we will consider.

JAMES FINDLAY.—We have no hesitation in recommending the camera you name for hand-camera work. You require a good light. Why should you fix upon f/11?

A. T. NEWINGTON.—We publish your answer re "Dark-room Lamp," and feel sure many of our readers will act upon your instructions, and make a lamp.

ED. HAWKINS.—The monthly competitions were established first to induce amateur photographers to compete for the AMATEUR PHOTOGRAPHER'S medals; and, secondly, in order to be able to loan collections of amateurs' work to photographic societies. We are, therefore, of course compelled to ask that the print (one) becomes our property. The pleasure and profit derived by the examination of the "Monthly Competitive" prints has been, and will be, very great.

C. WOODING.—Though against our rule, we have replied to you by post.

J. TAYLOR.—We never advise as to the best plates or apparatus in this column by name. Those first named in your letter have never "deteriorated." As far as we know, they are excellent plates. The second are universally good, and we have never found the least difficulty in "getting density."

MAJOR BECHER, R.A.—Have written to you. Your experiences in India will be most interesting to our readers.

H. H.—Very glad you have decided not to enter at Newcastle. It is unfair to both to link amateur and professional.

LENS.—You have named excellent lenses; but we should favour for your purpose A or B.

ALL SAINTS.—Your negative is probably spoilt. Why did you attempt to print before it was dry, and why did you not varnish? We insert your query; some of our readers may help you.

ALEX. KEIGHLEY.—Many thanks for your letter. "Prize Pictures No. 1." is published, or will be in a few days. Glad you endorse our remarks. Opposition to the awarding of medals from that quarter is really "too absurd."

H. MACLEAN.—Thank you for calling attention to the delay in sending down copies of AMATEUR PHOTOGRAPHER. Our publishers will see Messrs. W. H. Smith and Sons, and get the matter remedied.

T. W. BACON.—Will have the same set up, and proof sent to you.

E. M. H.—It is rather difficult to colour silver prints, but you can "work up" bromide prints with water colours.

J. D. MCKEADY.—Polytechnic Institute, Regent Street, W.

W. G. G.—We have not used either 1 or 2, but are pleased with what we have seen of both. No. 3 is quite a reliable instrument. In regard to No. 4 see our leader in January 24th issue. The lenses you mention are very good. Did we not give you our personal opinion when you called?

H. DENNIS TAYLOR.—Your excellent paper will be published in full in the PHOTOGRAPHIC SOCIETIES' REPORTER. We will send you slip proofs, and shall be glad if you make an abstract for the AMATEUR PHOTOGRAPHER, not to exceed two columns in length.

A. C. PEMBERTON.—You must conform to the conditions laid down by us in connection with our Lantern Slide Competition, or not enter your work.

T. J. BRIGHT.—We are quite contented to leave the matter as it was settled by the judges.

FLEET.—We are very much obliged to you for your notes, and are at all times glad to hear from subscribers as to the conduct of the journal. We will study your suggestions carefully, and adopt such of them as we can. We have many hundreds of communications, pamphlets, books, etc., that never receive attention because they have no bearing upon photography. One thing we would ask you when next writing: To use more paper, less ink, write in one colour, and pray don't cross your letter.

R. SHAW.—We have not the remotest idea what you refer to in yours of the 8th inst. On receipt of postcard will reply and return you the two stamps.

W. J. EARLY.—Your communication re dark lamp is to hand. We may at an early date refer to the same.

W. G. EVANS.—The print you sent us has the appearance of being printed from a badly-fogged negative, and sadly lacks definition. Glad you are going to give the "Country Cousin" plate. Am sorry we ever had the name of the seller. It has given us an immensity of trouble and no thanks. The letter you send us fully bears out what we have before stated, that they are "old stock."

PAUL LANGE.—We are writing you.

B. V. F.—We prefer No. 4 on your list, but this opinion need not be taken as detracting from the others, which are all good and serviceable.

ANXIOUS.—The camera you mention is a good and reliable one. The focussing is done by rack and pinion.

L. W. D. MAIR.—We certainly recommend it as a good all-round camera.

T. B.—Apply to the Curator, at the Gardens, for an artist's ticket.

BOLNEY.—Send us one or two of the faulty negatives, and we will try and advise you; without them we are powerless. The double image is, we think, caused by a shifting of the camera during exposure, possibly by wind.

IN THE DARK.—We cannot enter into details with regard to the lens named. We should prefer to go to the actual maker, and should recommend D on your list above the others.

PORPHYRIA.—We cannot give an opinion on the goods named. Why not bargain for a trial previous to purchase? We do not understand your other question.

TAPO.—Use two lights, one on each side of the figure, so as to prevent the shadows which trouble you.

R. O. S.—The camera is good for the money, but you can hardly expect to turn out the best work with it.

A. J. J.—The distance of diaphragm from lens should be two inches in the case named.

FLEK.—(1) We know nothing of the make named. (2) By far the best of the lot. Little to choose between 7, 8, and 9, therefore it would be well to consult contents of purse. Thank you for your valuable and appreciative remarks.

T. HARRIS.—At any electrical warehouse.

A. F. N. P.—Your slides are far too thin—probably from over-exposure. You would do well to choose a method of development which gives a black rather than a yellow tone to the positive.

F. F.—Why do you not try a simple experiment, which would at once satisfy you on the point? It is impossible to answer your question as it stands, for so many different circumstances must be taken into consideration.

ORDNANCE.—We are glad that you quite grasp our meaning with regard to reproductions same size as original.

H. M. P.—Get the manual published by the Autotype Company. You cannot have a better guide.

WORCESTER.—(1) Wormald's tables are as good as any, and easy to understand. (2) Add alkali in case of under-exposure, and reduce same in case of over-exposure. No alum bath necessary.

W. T. G.—Try Payne's formula with caustic potash, as brought some months ago before a meeting of the Newcastle Society, and duly chronicled in our columns. The plates in question are all coated of the same thickness.

DETECTIVE.—(1) Yes. (2) We do not recommend. (3) Should not advise a portrait lens for detective camera.

LEWIS M. BIDEN.—The last paragraph in your letter should form the matter for an advertisement in "Sale and Exchange" column—three words a penny.

F. A. HAHN.—Why not try the same firm's make of hand camera? It is a very good one.

L. O. SHACKELL.—A very good and useful camera; any lens can be fitted with an adapter or second front.

WALTER HUGHES.—Very many thanks for your prompt attention and courtesy in acknowledging receipt of letter.

G. WATERS.—Very shortly; perhaps we may be able to give date next week. Your opinion of the QUARTERLY is very gratifying and encouraging.

D. E. GODDARD.—We have not escaped. Have written Aylesbury re your papers, and will let you know. Sorry to hear so bad an account.

A. T. J. (Stockholm).—We cannot send you specimen prints. The "thing" is a cheap and rubbishy toy; we could not advise you to purchase it. Your queries are inserted.

E. L. BECHER.—Your supposition is undoubtedly the correct one.

Sale and Exchange.

RULES.—Four penny stamps for twelve words or less and one for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. A single figure, or group of figures undivided by letter, space, stop, or words counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Sale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Artists' Oil Colours, brushes, cost 30s., sell, or exchange quarter camera.—Girling, Crown Street, Diss.

Cameras.—Nearly-new modern half-plate camera, perfect, latest improvements, three double slides, and tripod.—Jones, Enfield House, Uffculme, Devon.

Kodak camera, equal to new, price 72s. 6d., cost 105s.; would exchange with little cash for Ross'

half-plate Universal lens.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Kodak, containing film unused for 80 exposures, only used once, in perfect condition; £4.—Can be seen at Stereoscopic Company's, 110, Regent Street, W.

Cameras, etc.—Lancaster's 1888 Instantograph camera, two double dark-slides and stand, in good condition, with case, complete, 40s.; also eight vols. *AMATEUR PHOTOGRAPHER*, bound; what offers?—Photo, 8, Cobham Street, Gravesend.

Splendid whole-plate camera, slides, and tripod, with shutter attached, latest improvements, good maker, on approval; price and particulars.—Photo, 315, Crookesmoor Road, Sheffield.

Camera Bellows.—Camera bellows. Amateurs requiring such should apply direct to the manufacturer. Every description made. Manufacturers supplied at reduced prices. Stamp for reply. — J. Johnson, Back 181, Irving Street, Birmingham.

Camera Case.—Half-plate canvas camera case, shoulder straps, excellent condition; 6s. — F., 32, Binglefield Road, Clapham.

Dark-Slides.—Three whole-plate dark-slides, with ebonite shutters; 4s. 6d. each.—Wratislaw, Braunston, Rugby.

Dark Tent.—Portable dark-tent, in leather case, with sink, shelves, ruby window, condition as new; cash 20s.—Moulds, South Wigston, Leicester.

Hand-Camera.—Diamond detective camera, perfect, 21s., or exchange quarter camera; wanted, 5 in. condensers.—Tooth, Caldecott Street, Rugby.

Lantern.—Hughes' Pamphengos lantern; cost £1 4s.; will take £2 15s.; good as new.—C. Naylor, Batley.

Lenses.—Splendid half rapid rectilinear lens; 2½s.; bargain.—Bull, 5, Alvey Street, Waltham.

Grubb's 3B quick-acting portrait lens, 3½ ins. diameter; what offers in cash, or half-plate outfit, good make?—C. Naylor, Batley.

Half-plate Lancaster's instantaneous lens, with Iris diaphragm and patent shutter, new last year, 20s., bargain; doublet lens, quarter-plate, 5s.—Wm. Tench, Church Street, Kidderminster.

Half-plate lens (by Darlot), with stops, equal Ross' Universal lens; price 35s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Lens, etc.—Pair of Dallmeyer's quick-acting single stereo lenses, 4½ in. focus, quite new, £3, or exchange for pair of 6 in., same maker. Rouch's portable dark-tent, with waterproof case and tripod, nearly new. £3.—Dollery, 57, Charing Cross, S.W.

Musical Box.—Good 8-airy musical box for good quarter camera and back.—C. Lambert, 6, Stanley Road, Leeds.

Negatives.—Foreign views, lantern negatives, 4s. per dozen; sample 7d.—41, Trafalgar Road, Old Kent Road.

Sets.—Lancaster's 1889 half-plate Instantograph camera, complete throughout, and in finest order; all latest improvements, reversing back, leather bellows, all movements, fitted with a rapid rectilinear lens, Waterhouse stops, very fine definition, covers plate to edge, slide carrier and folding tripod; lot complete, £3 15s.; approval.—Cooper, 9, Sussex Terrace, Markfield Road, West Green.

Quarter camera, landscape lens, light fourfold stand, 22s.—Wooding, Castle Ashby, Northampton.

Half-plate Instantograph, reversing back, instantaneous lens, shutter, two double backs in leather case, patent universal stand in case, new condition, £4 15s. J. Cass, Cocker Street, Blackpool.

Half-plate International camera R.R. lens, 3 mahogany double backs, instantaneous shutter, Ashford's patent tripod, nearly new; also 5 dishes, 3 printing frames, a few Ilford plates, chemicals, etc., £5 10s., approval.—E. J. Organ, 12, Woodlands Terrace, Swansea.

For sale—a Lancaster's Le Meritoire quarter-plate camera, with lens, tripod, and 2 double backs; also *Science Gossip* for 1883, 1887, 1888 and 1889; the lot, 38s.—Frank Duncan, 6, Grosvenor Road, Gunnersbury, W.

Watson's half-plate latest pattern Premier camera fitted with Watson's R.R. lens, tripod, 2 double backs, 2 carriers for quarter-plate, complete in solid leather, velvet-lined case; only used few times; price £10; approval on deposit.—E. F. C., care of Dalley, 57, High Street, Putney.

Marion's unique half-plate camera, six double backs, tripod, Lancaster's instantaneous lens and shutter, £5; Underwood's City detective camera, £2; Optimus 7 by 5 lens, £2; Lancaster's half wide-angle lens, £1; all nearly new.—Cuthbertson, junr., Church Street, West Hartlepool.

For sale—complete whole set, consisting of Optimus R.R. lens, Elliott camera, 3 double dark slides, printing frames, dishes, tripods, etc.; approval deposit system.—Evans, Minehead, Somerset.

Kodak, never been used, 3 gs.; half-plate camera, all modern improvements, leather bellows, long focus, 6 mahogany double backs, 90s.—Shaw, 5, Gt. Ancoats, Manchester.

Half-plate camera set by Wood, Cheapside, three double backs, Trafalgar R.R. lens; all complete in solid leather case, with patent lock, and tripod stand; cost 11 guineas; cash £8 10s.; or exchange for safety bicycle; must be light and good make; also whole-plate and 10 by 8 R.R. lens, whole-plate view lens, carte burnisher, developing tent; cheap.—44, Bower Street, Maidstone.

Lancaster's quarter-plate Instantograph camera, with lens, stops, and Instanto shutter, folding tripod, 2 double slides, 3 dishes, 3 printing-frames, ruby lamp, 2 negative boxes, carrying case for camera and slides; the whole, 40s., or exchange with cash for half-plate, same make.—Moulds, South Wigston, Leicester.

Lancaster's Instantograph lens, half-plate, Iris diaphragm and shutter, price 20s., very little used, or exchange for two double dark-slides (book form) of same set; approval.—Evers, Paversham, Kent.

Half-plate, best quality camera, with 4 double backs by Perken, Son, and Rayment, 4-fold tripod and solid leather case to take lot, all equal to new; cost 203s. 6d.; price 140s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

An American Seoville Co's landscape camera, with 3 double slides and leather case, also portable tripod stand, and Ross' symmetrical lens; all in good working order; cost over £12; for £7 10s.—Henry R. Taggart, junr., Tontine House, Cross, Glasgow.

Half-plate light Universal camera, three slides, reversible back, double swings, four-fold stand, turntable top, double extension, 3B Suter lens and detective case, cost £18 18s., price £12 12s., or reasonable offer; Watson detective camera, new, price £7.—6, Montford Place, Kennington, S.E.

Shutter.—Kershaw shutter, with adapters to fit any lens; 12s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Shutter, etc.—Leiske's patent instantaneous shutter for half-plate, 15s.; Stereoscopic Company's perfect photometer, 5s.; the two for £1; in good condition; cost almost double.—S. C. Leech, Chetwynd House, Derby.

Sundries.—Cash or photographic exchange wanted for small gold watch, 1 in. diameter, 80s.; Lerebour's half-plate portrait lens, 40s.; 5 by 4 camera and portrait lens (by Dale), 20s.; gas bag, retort, spirit jet, etc., 40s.; dipping baths, silver bath, and collodion and Woodbury's actinometer, etc.; wanted good shutter, rectilinear lens, backgrounds, posing chair, or other offers.—No. 48, AMATEUR PHOTOGRAPHER Office.

WANTED.

Apparatus.—A photographer opening a branch studio shortly would like to hear from anyone having portable studio lenses (Ross or Dallmeyer), cameras, or other accessories in good condition.—Particulars and lowest cash price to Thompson, Omagh, Ireland.

Burnisher, etc.—Half-plate burnisher, dishes, carriers, cheap.—88, Albert Road, Croydon.

Camera, etc.—Will give first-class half-plate (new last July) and cash for equally good whole-plate camera; wanted also, some dishes, 12 by 10.—Send full details to Crossley, Rodley, Leeds.

Double Backs.—Double backs for Lancaster's half-plate Instantograph.—A. K., 8, Leabourne Road, Stamford Hill, N.

Hand-Camera.—Shew's Eclipse hand-camera, with changing back; 5 by 4 or half-plate preferred. E. T. Wood, 18, Barbican, London.

Fallowfield's Facile or Abraham's detective camera.—6, Montford Place, Kennington, S.E.

Lenses.—Pair of R.R. lenses for stereoscopic work.—C. Naylor, Batley.

Half-plate R.R. lens; give in exchange printing press and quantity of type, or sell 35s.—4, Park Hall Place, East Finchley.

Dallmeyer's 1½ in. R.R. lens.—Field, 81, Ossulston Street, N.W.

Lens, Tripod, etc.—Watson's cyclist's tripod, with sliding legs; half-plate wide-angle lens and pair good stereoscopic lenses.—Higgin, 202, Upper Brook Street, Manchester.

Mount.—P. C. S. A. 5 by 4 true view lens shut mount.—Langlands, Pleasance, Dundee.

"Phot. Soc. Reporter," No. 1.—Fulcr, Rampant Horse Street, Norwich.

Shutter.—Thornton-Pickard (time and instantaneous) to fit lens-hood 1½ ins. diameter.—Boothman, 46, Thurlow Street, Salford.

Thornton-Pickard time and instantaneous shutter to fit 2½ lens; approval.—E. N. Ellis, 2, High Street, Wavertree, Liverpool.

Set.—10 by 8 or 10 by 12 outfit, camera, slides, lens, tripod, etc., preferred, or separate; good makers; cash.—"Plates," H. Vears, Staines.

Half-plate camera, lens, etc. (complete set), good make; state particulars and price.—Weatherly, Eaton Street, Hanley.

Wanted good half-plate camera, lens, and slides.—Evans, Minehead, Somerset.

"The high-water mark of modern Photography."—*Art Journal*.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS OF THE AMATEUR PHOTOGRAPHER will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	Feb. 14 ...	June 14.
LANDSCAPE WITH FIGURE	Mar. 14 ...	July 14.
GENRE OR FIGURE STUDY	April 14 ...	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	May 14 ...	Sept. 14.

Entry forms on receipt of stamped addressed envelope.

THE FORTH BRIDGE.

IN view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the AMATEUR PHOTOGRAPHER have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

<i>First Prize</i>	Silver Medal and £1 1s. 0d.
<i>Second Prize</i>	Bronze Medal and 10s. 6d.

Photographs must be sent in on or before **Monday, the 10th of March**. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the AMATEUR PHOTOGRAPHER, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition," The Editors, *Amateur Photographer*, 1, Great Lane, Ludgate Hill, London. E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

Subjects, Conditions, etc., forwarded on receipt of stamped addressed envelope.

Elliott & Son's "BARNET" Dry Plate

THIS Plate is rapidly growing in public favour. For months past the Proprietors have been unable to cope with orders that have come to hand. They have, therefore, in order to meet the demand, built and fitted up, in the most complete manner, extensive premises, and are now turning out large quantities of plates which are rapid, rich in quality, inexpensive, and reliable.

To be obtained from all Photo Dealers.

[PRICE TWOPENCE.]

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

THE Crystal Palace Photographic Exhibition will be opened on Tuesday, March 11th, and it is now quite certain that although one or two leading London firms may not exhibit, there will be a far larger number of exhibitors from the provinces, and the apparatus section will be thoroughly representative. We cannot speak too highly of the Challenge Cup competition, open for competition to any photographic society in the United Kingdom, the only condition being that the society, as such, must send at least fifty pictures. We are pleased to be able to state that there is little doubt that, although the conditions were only recently made public, several societies will enter. We feel satisfied that when it is known that the challenge cup will become the actual property of the society who are awarded it three times during seven years, there will be eager competition.

* * * *

As far as at present arranged, almost the whole of the pictures contributed to the AMATEUR PHOTOGRAPHER Prize Tour Competition will be exhibited, and we would ask competitors to send their work in frames, or allow us to frame the same; prices are given in our advertisement pages. We would also urge competitors to forward their photographs, framed or unframed, as soon as possible, especially as a catalogue has to be prepared which will be incorporated with the Exhibition catalogue. We have very great pleasure in informing competitors that the whole of their work will be entered as for the general exhibition, and each competitor's work in the Prize Tour Competition will stand the chance of being awarded a prize at the hands of the judges of the Crystal Palace Photographic Exhibition, in addition to those offered by ourselves.

* * * *

WITH regard to the slides entered in our Lantern Slide Competition, we have the pleasure to publish in another column a list of competitors. Some 600 slides have been received from fifty-nine competitors. They will be judged to-day (Friday), and the award of the judges, Messrs. J. Gale, C. Hussey, and Lyonel Clark, will be published in next week's issue. We shall, through the courtesy of the Directors of the Crystal Palace Company, and with the

assistance of Mr. Brooks, exhibit a selection of slides on the afternoon of Friday, the 14th, and another selection on Saturday evening, the 15th of March. A ticket admitting two to the exhibition and lantern show will be forwarded to each competitor, and be available either on the afternoon of the 14th, or the evening of the 15th. On the Friday we shall invite our competitors to take "afternoon tea" with us, for which purpose a pass to the tea-room will be sent with the ticket. We shall hope by this means to make the personal acquaintance of many of our readers who enter the AMATEUR PHOTOGRAPHER Competitions, and who hold at such a high value the medals we place at their disposal.

* * * *

WE have been asked to remind intending exhibitors that the last day for entering photographs for the Crystal Palace Photographic Exhibition is the 1st of March.

* * * *

ALL photographs, framed or unframed, for the AMATEUR PHOTOGRAPHER Prize Tour Competition must be sent addressed to 1, Creed Lane, Ludgate Hill, London, E.C., by the 28th of February.

* * * *

WE were hardly in order in crediting Mr. Ernest Beck, Hon. Secretary of the Sheffield Photographic Society, with getting up the Lantern Exhibition to be held next week. The scheme, it appears, originated with Mr. Frith, Vice-President, and was at once taken up by the President, Mr. B. J. Taylor. It is to be a "members' show;" even the lecturer and operator are to be members. The object of the exhibition is to give financial help to the building fund of a local hospital and dispensary. Mr. Beck writes, "They are trying to extend their usefulness, and in this way so are we."

* * * *

THE loan of AMATEUR PHOTOGRAPHER lantern slides has resulted in scores of most grateful and thankful letters. We shall be glad of gifts, not for ourselves, but to help those who work so hard to give pleasure to others. We will loan slides to anyone wishing to instruct and

amuse those who, owing to circumstances not under their own control, are unable to gain instruction or rational amusement themselves. We insist upon the *skilling packing fee*, and a quick return of the slides. During the summer months we hope to arrange slides for evening entertainments, with rough notes to help the demonstrator.

* * * *

WE have received the second number of *Sun Artists*, and do not intend to waste space upon a critical review. The illustrations we will dismiss with but a few words; those issued with No. 1 had faults which we very clearly pointed out, those in No. 2 are no better, and we are sure that Mr. H. P. Robinson will not be at all gratified to find that the much-vaunted photogravure has only yielded him prints which are but a shade better than those to be pulled from any type-block. If our readers doubt the assertion, let them compare the reproductions of Mr. Robinson's photographs in the last edition of "Picture Making by Photography," with those in the issue of *Sun Artists* now under notice, or compare them with the Woodbury prints from Keighley's negatives, in AMATEUR PHOTOGRAPHER "Prize Pictures," No. 1. For the descriptive essay and biographical sketch by Mr. Andrew Pringle, we have nothing but praise. It is a charmingly written essay. In it the writer never allows his intimate knowledge of and sincere friendship for Robinson to get the upper hand, and run into "gush." The opinions expressed on every point are those that must be held by all liberal-minded and right-thinking men. It is impossible to read such an essay without having a higher sense of the possibilities of photography, and understanding how the love of it enabled Robinson, amongst others, to release it from the charge of being a "vile mechanical handicraft," and elevate it to an art which even the most eminent painters in the kingdom have used as a handmaid and a helpmate in the building up of their most famous pictures.

* * * *

THE prints contributed to the Monthly Competition, "Landscape and Seascape," will be on exhibit at our offices all next week.

* * * *

THIS is what a *professional* photographer in North Brunswick says of the AMATEUR PHOTOGRAPHER:—"Recently a friend brought me a parcel of AMATEUR PHOTOGRAPHERS, and in an idle moment I betook myself to reading one of them, and to my surprise, I got so interested in the cleverly written articles that they contained, that I neglected everything else. The articles are so cleverly discussed and explained, that I think it is a pity your paper is not better known to professionals in Canada."

* * * *

THE following letter has reached us from a correspondent:—

"I know that at a recent exhibition held at Guisborough, prizes were offered for amateur photography, and the second prize was awarded to a man who had not only forfeited his standing as an amateur, by selling his work for a profit, but has actually for some time past published a *trade advertisement*, soliciting orders from the public for portraits, groups, and all kind of photographic work. He has also weekly published a photograph of some prominent football player, and had lads selling the same in the streets. Now, sir, is not this a flagrant breach of all rules regulating AMATEUR PHOTOGRAPHER competitions; and if men trading in photography in this manner be allowed to compete in amateur competitions, where is the distinction? I really think that such a glaring case of inconsistency

deserves exposing. If you think the same, perhaps you will find room for this in the next issue of the AMATEUR PHOTOGRAPHER."

WE have no remembrance of an exhibition at Guisborough, and certainly do not think it likely that the exhibition was held under the AMATEUR PHOTOGRAPHER conditions, or that our medals were offered for competition. We shall be pleased to hear more of the subject. It is now so well known all over the world that professional photographers are not eligible to enter in competition for the AMATEUR PHOTOGRAPHER medals that we cannot think that one of the medals is likely to have been awarded to a man whom we should describe as neither "fish, flesh, fowl, or good red herrin'." Our conditions are drawn in such a form that no professional photographer could honestly enter the competitions and sign the declaration.

* * * *

A MEETING of those in favour of forming the Croydon Camera Club will be held at 8 p.m. on Tuesday, 25th, at Room 2, Public Hall, Croydon. All who approve the project are requested to attend, or, should they have previous engagements, write their approval to Mr. H. Maclean, 34, Birdhurst Road, Croydon. Already a very considerable number of gentlemen are prepared to support the movement.

* * * *

GAS CYLINDERS.

THE supply of compressed gas in cylinders has now become an industry of no small dimensions, and although to most of our readers it may be regarded as something quite new, as a matter of fact gases so compressed have now been in the market for many years. But as it is only quite recently that the two gases used for the lime-light have been so supplied, the system, although it is not new, has not, perhaps, come within the ken of photographers, for in this last application of it only are they interested. Dentists have for a long time used nitrous oxide in this form, as the safest and most convenient anæsthetic for minor operations, and carbonic acid so compressed has been for many years purchasable, and has been thus used by lecturers and in certain industries. But although oxygen has been prepared and compressed for sale in cylinders for some fifteen or more years, its supply did not become at all general until by the Brin process it was found possible to separate oxygen from its association with nitrogen in the atmosphere, and to furnish it to consumers at a cheap rate.

No sooner was oxygen thus supplied, than there came a natural demand for hydrogen, for, as all know, the most effective limelight is attainable only when these two gases are placed under pressure. (We leave out of consideration here the new methods of using oxygen in conjunction with the vapour of ether, benzoline, etc., regarding them as being still in the experimental stage, although we know that an extremely brilliant light can be obtained from them.) The system of compressing gases offers many advantages to the worker. The two bottles containing sufficient gas to last for an ordinary evening's work occupy only a fraction of the space required by the bulky india-rubber bags and pressure boards which they supplant. No weights are needed, and weights are sometimes, owing to the common employment of new forms of weighing apparatus, uncommonly difficult to procure at short notice. Another advantage is represented in the time and trouble

saved in the avoidance of the tiresome and rather dangerous business of making oxygen gas, and in filling the hydrogen bag from the main. With regard to this latter operation, we have occasionally been called to show the limelight in a district where gas lighting is unknown, and have had to take the bag to be filled at a distant town. All these mishaps and inconveniences are avoided by the use of bottled gasses, so that it need not be wondered at that cylinders are now superseding bags.

But in exchanging new lamps for old we must have every confidence in our bargain, and must feel sure that the newly found friend is to be trusted as much as the one which we discard. Some workers are disposed to look askance at the cylinders, and to ask whether they are safe to use. They are rather frightened when they first learn that the internal pressure is that of 120 atmospheres. They know that one atmosphere means a pressure of 15 lbs. on every square inch, which multiplied by 120 gives the sum of 1,800 lbs. on the inch. This means roughly that the initial pressure upon the interior of one of these cylinders amounts to about twelve times as much as that at which a locomotive boiler is usually worked. This is a somewhat startling statement to those who know nothing about the tensile strength of metals; but their alarm will be allayed when it is known that the cylinders are tested by the makers to more than double the pressure stated.

Very few accidents with these cylinders have up to the present been recorded. One exploded with fatal results at Woolwich some years ago during some ballooning experiments; but we may be certain that the cylinder in this case was not so carefully made as those now issued. Then a couple of years ago, a terrible accident, in which the chief actor perished, occurred at Dublin. In this case it was proved beyond doubt that the man who lost his life foolishly tried experiments with a cylinder which contained an explosive mixture of hydrogen and oxygen. A third fatal accident occurred only the other day at Glasgow, and this one seems to be due to some unexplained cause. The Secretary to Brin's Oxygen Company, in a letter which has been published, states that this accident did not occur from over-pressure, but from spontaneous combustion of mixed gases. We do not know his authority for this statement, for we were under the impression that the mixed gases, hydrogen and oxygen, although possessing terrible explosive power, required the application of a spark or light before they could explode. He bases his opinion upon the circumstance that a piece of the cylinder which was picked up near the scene of the disaster was quite hot. But surely this does not necessarily prove that actual ignition took place, for the violent disruption of the metal would be quite sufficient to account for the evolution of great heat. There is certainly room for enquiry and experiment here. Gases under great pressure have not hitherto come under the notice of physicists, except, perhaps, in those notable instances some few years ago when the so-called permanent gases were reduced, by far greater pressure than that we are now considering, to the liquid state. If gases mechanically mixed together are liable to spontaneous combustion, it is a circumstance not hitherto known to chemists, and one which demands enquiry. We are rather inclined to believe that in the Glasgow case, supposing that ignition of the gases actually took place, the initial heat may have been due to some foreign body—possibly oxide of iron.

Letters to the Editors.

CHEAP PLATES.

SIRS,—I have seen a lot of writing from time to time in your useful paper upon the so-called overcharge in the price of dry plates, and cannot refrain from a line or two. I think the complainers on that score are in want of something to grumble about, as I have myself often wondered where the profit can lie when one looks at a whole-plate, for instance, for fourpence; the size of the piece of glass, the carefully prepared emulsion, the squarely cut glass, the flatness of the glass, and the whole thing together requiring careful manipulation in the manufacture.

If the user of the plate is a professional and has brains enough in him to obtain a good business, it should be worth its present price to him; and if he is an amateur and feels the loss of the cash now paid for a good dry plate, I would say, let him at once give up the expensive hobby of amateur photography for some "amusement" of a more economical kind. The "workmen" have to live as well as the manufacturer. The motto of some of the complainers as to the great price of dry plates should be "Live and let live."—Yours,

A. W. GOTTLIEB.

"THE ARMSTRONG ILLUMINATING CHAMBER."

SIRS,—I do not know if I am overstepping my bounds in addressing you on this subject, but no doubt you will be the best judges, and publish or withhold same as you think best.

While not desiring to detract from Mr. Armstrong's invention (?), and not knowing his method of working same, I will give you a description of a chamber I have had in operation since October, 1889. The idea emanated with myself.

Having asked an amateur friend how to make lantern slides by reduction, he told me to place my negative in a window and block out the surrounding light, and photograph that coming through the negative. After trying this method for some time, it struck me that by artificially illuminating the negative I need not rely upon the weather.

My method of procedure is as follows: Having procured an ordinary packing box of about 2 by 1½ by 3 ft., I cut a hole in the lid corresponding to printing frame (in this case half-plate), and fixed the frame in it. I next placed my negative, with a piece of ground-glass behind it, in the frame, and put a gas burner behind this. I found the negative brilliantly illuminated, but a flare-spot in the centre. This I found would not do.

I next tried with two paraffin lamps, one on each side of the negative, and shaded the negative from direct rays by a piece of cardboard on each side of the negative, and was pleased to find a perfect illumination all over.

I have made a few slides in this way, and am perfectly satisfied with the results. My method, as you will see, is inexpensive and one many amateurs like myself can practice.

I intend shortly to try enlarging by its means. The method I propose following is to place my camera in the same way one would do for daylight enlargements.

The ordinary yellow pine box answers well, but I find it better to pin sheets of white paper inside the box, and so increase the reflected light power.

VERITAS.

HYDROQUINONE AND INTENSIFICATION.

SIRS,—Contemporaneously with my letter to you on this subject there appeared in the pages of the *British Journal* an article on "Control in the Density of Negatives," in which the writer, Mr. Chapman Jones, treats of the actions and results of mercuric chloride, sodium sulphite, and ferrous oxalate, when used for the purpose of intensification.

All I am able to gather from the maze of equations and chemical technicology is, that, according to some analysts, the sulphite produces "a transient blackening," which confirms my experiences; that the writer's experiments are admittedly incomplete; and that he prefers the ferrous oxalate as a darkening medium. Until I tried hydroquinone, so did I.

I think, however, he is wrong in claiming to be the first to recommend ferrous oxalate, which he says he did in 1888; for it was advocated by Messrs. Burton, in the *British Journal* (pp. 287, 294) as far back as 1881!

Perhaps Mr. Chapman Jones won't mind adopting the sug-

gestion of an humble amateur like myself, and testing the powers of hydroquinone, as recommended by me. It may be that, after all, the darkening is in some measure due to the presence of the sulphite in the hydroquinone developer I use. But if so, the latter has a salutary effect upon the sulphite, which, when used alone in a five or ten per cent. solution, has a capricious and irregular action, and if the image is a weak one, occasionally effaces it entirely.

One of your querists, "Lola," does not seem to have yet discovered this; but if she wants practical proof, let her immerse a negative in a sulphite solution, and, under certain circumstances, she will soon look for the picture in vain. Indeed, I have often used sodium sulphite instead of ferriyanide of potassium for the purposes of reduction.—Yours, etc.,
A. E. VENN.

* * * *

ECONOMICAL USE OF THE ROLL-HOLDER.

SIRS,—I read the article which appeared in last week's issue about "Hints Respecting Roll-Holders," and I should like to mention a way I have found of avoiding the slightest waste when cutting the film. Last summer I used in a half-plate Eastman roll-holder a roll of Morgan and Kidd's negative paper. I had occasion to cut the film two or three times, and to avoid waste I cut a piece of gummed paper the exact width of the film, and about 15 ins. long. I then damped about three-quarters of an inch of one end, and stuck just that width of damped part to the back of the film end. The free end of the gummed paper was then clamped on the winding reel, and the edge of the film pressed on the perforating points (these having previously been set in the correct position for indicating exposures), and the gummed paper wound up tightly. It was then ready for use. When I again cut the film, all that was necessary to do was merely to cut the gummed paper along the first edge of the film, and stick it to the next piece in the same way as described above. The piece of gummed paper left on the back of the cut film readily came off in the developer.—Yours faithfully,

E. H. GILBERT.

* * * *

IS HYDROQUINONE POISONOUS?

SIRS,—On looking over the letters which have appeared from time to time on the above subject, I think the following facts may be of use in its elucidation. When experimenting with this developer some time back, my attention was drawn to the peculiar nature of the stain produced by this developer. Unlike the pyro stain, acids had little, if any, effect in removing the stain, but, on the contrary, seemed to increase it in some cases, transforming it from a lemon-yellow to a much ruddier colour. Working on these facts, I came to the conclusion that the stain was nothing more nor less than a *chromate* stain, and resolved to try just the reverse for its removal, viz., *alkalies*, with the result that liquor ammonia instantly removed all trace of stain, and being, for obvious reasons, superior to any other alkali for this purpose, I gave the requisite strength for its use in my letter which appeared in the issue of the 26th July last. All this would seem to prove that hydroquinone is a chromate salt, but whether it is originally so, or when in conjunction with certain alkalies, or during the developing action, that the chromate salt is formed, has yet to be proved. But in any case, if a chromate, poisonous as all chromates are, and "A Victim" seems certainly to have suffered from chromate poisoning, though in all my experiments with this salt, I have not experienced any such symptoms as described by "A Victim."

My opinion is that such would only occur from the use of the same developer several times over, and the decomposed component parts work their way through cuts in the fingers or hand, and thence into the blood, and being at the same time in a bad state of body; otherwise this developer, "I hold," is as safe as our "old friend" pyro.—Yours truly,
S. N. GORDON.

* * * *

PLATINUM AND GOLD.

SIRS,—I am sorry there has been no reply to the short letter that I wrote you a few weeks back *re* platinum gold prints, as I felt certain several workers would have *something* to say on the subject. Am I to understand it to be a new idea, or is it possible that the idea was too well known to cause any notice? I am afraid I shall be unable to further experiment (at any rate, for

some time to come), but hope others will try and develop the idea so as to be of real use. All I did was as follows: I printed on the "cold bath" paper just as for that process, and then having "damped" as usual, I brushed carefully but quickly a solution of gold chloride 1 grain, water 2 drachms, over the print, when it quickly changed to a purple colour, due to the reduction of the gold. Now, could not the colour be altered by suitable additions of some salt or salts? If so, a very pleasing tint might result, and the print could not fail to be quite permanent.

If there are any amateurs who suspect their ruby lamps to be "unsafe," then I strongly recommend them to use in front of the glass a screen of the orange (not yellow) paper, like some plates are wrapped in. This allows the light to be turned high, and gives a very pleasing and healthy light; at least, I always have found it so, and the plates may be developed quite close to the lamp with perfect safety. I not long ago tried the fogging effects of the different lights, and found the pale ruby glass to cause much fog in ten minutes; the dark ruby not so much fog, but yet enough to spoil plates; but the light ruby and orange paper, although appearing to give more light than either of the others, produced a quite imperceptible and un hurtful fog, in fact none to speak of. The sensitive surface being six inches from the flame in every case. I am, sirs, yours faithfully,

February 17th, 1890.

SYDNEY WEISS.

Apparatus.

PEARSON AND DENHAM'S REDUCING CAMERA FOR LANTERN SLIDES.

We have received from Messrs. Pearson and Denham, of New Station Street, Leeds, a very excellently designed and manufactured reducing camera for lantern slides, which has been provisionally protected. The illustration given will help our readers to understand the construction and working of the camera.

One of the novel features of the camera is the sliding rod arrangement in place of telescopic boxes or bellows, by the use of

which the lens is left open and free. The spring carrier for negatives permits of any part of the picture being copied. The opening of the focussing screen is of the same size as a finished lantern slide, showing at a glance the amount of subject that will come in on the plate. The dark slide is so constructed and secured that no displacement can take place, and no "sliding in" is necessary. All slides are made to gauge, and can be supplied in any number without fitting each one to camera back. It will be noticed that the box carrying the negative is of sufficient length to exclude all harmful light. The focussing cloth may, however, be thrown over the brass rods if desired. The rods can be lengthened or shortened by unscrewing the milled nuts and passing the rods further through the sockets.

Any lens from 5 inch to 8 inch back focus can be used; the makers say that either a half or quarter plate rectilinear are suitable, and the focussing can be effected with full aperture, the lens being stopped down during exposure to *f*/16. The negative is easily centred on the screen.

The camera is really a most useful and serviceable piece of apparatus, and will, we feel sure, be largely used by amateur photographers. We shall have much pleasure in showing the apparatus to anyone who may care to see it.

THE THORNTON-PICKARD TIMING SHUTTER.

This shutter, which has been sent us by the Thornton-Pickard Manufacturing Company, of St. Mary's Street, Manchester, appears to have many advantages. It combines the instantaneous

action of the "roller blind" with the "time" shutter. It does away with the necessity of a cap for lens. The makers claim that the shutter gives the most rapid "instantaneous" exposures, the speed of which can be regulated at will, or a prolonged "time" exposure; an even exposure over the whole field, and can for interiors be set at "full open," and left as long as desired. The vibration is stated to be practically *nil*; the shutters are well made and simple in construction. We should say that the makers are likely to have a very large call for them.

The Complete Photographer;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER IV.

The Points of a Camera.

PHOTOGRAPHER.—You are punctual, my pupil.

PUPIL.—The best courtesy I can show you.

PHOTOGRAPHER.—We will now look at the apparatus. Mine is the accumulation of years, so we won't go over it all, but keep principally to what you will really require. Few photographers confine themselves to essentials. I never look at the accumulations of those who have practised for some years, or those who pride themselves on their collections of apparatus, without thinking of Diogenes' country fair.

PUPIL.—What was that?

PHOTOGRAPHER.—You ought to know. It is one of the quaint anecdotes told by Isaak Walton. This is what he says:—"Let me tell you, scholar, that Diogenes walked in a day, with his friend, to see a country fair; where he saw ribbons, and looking-glasses, and nut-crackers, and fiddles, and hobby-horses, and many other gimcracks; and having observed them and all the other finimbruns that make a complete country fair, he said to his friend, 'Lord! how many things are there in this world of which Diogenes hath no need.'" And truly there are some in photography who seem to toil chiefly to get together a choice collection of apparatus, and there are others, good workers too, who cannot resist the temptation to try everything new, and secure every novelty. With them the means is the end. Now what I want you to do is to make pictures, and go right straight to your goal. You are to be the tortoise, not the hare of photography.

PUPIL.—You expect too much, I am still young.

PHOTOGRAPHER.—A grievous but not unpleasant fault which time will eradicate. You will notice that I have three cameras, all identical except in size. The sizes are 15 by 12, 10 by 8, and half-plate. The first mentioned will be too much for you at present, but I think you may venture on the other two. The smaller one is large enough for general use, and the larger size is quite sufficient for making those wonderful exhibition pictures to which you very properly aspire. It seems to be decided by the general consent of amateurs that 10 by 8 is large enough for anything. I am not going to select a camera for you, the awful responsibility is too overwhelming. It is like recommending investments to a friend; if anything goes wrong, you get the blame; if it is a success, you hear no more about it. There are so many different patterns that I confess I am not free from bewilderment among them myself. I can, therefore, only talk generally on the subject. Before spending much money—and you can spend a small fortune over a camera or two now-a-days—you had better, by practice, learn to

know what you want. Buy one cheap second-hand, hire, or borrow.

PUPIL.—What! borrow a camera! I should think that would be as difficult as obtaining the loan of a fishing-rod. I never knew anybody willingly lend his rod.

PHOTOGRAPHER.—Ah! there is another parallel with fishing. If the thing were possible, I think I would prefer to lend my head than my camera or my rod. You possibly may meet a friend who was tired of photography, but those who give up are getting scarcer as photography gets more perfect. Well, you can look over mine, and we may get at the points of a camera as we would those of a horse.

PUPIL.—And set them forth as Shakespeare did—

"Round-hoof'd, short-jointed, fetlocks shag and long,
Broad breast, full eye, small head, and nostrils wide;"

and a lot more of it, with which I will not bother you at present.

PHOTOGRAPHER.—I know the passage; it shows prodigious veterinary knowledge. We will now consider the points of a camera adapted for work in the field as well as for all the home use that could be desired by an amateur. First of all to decide is whether you intend to carry your own apparatus. There is a great pleasure in being at liberty to go out when you like and where you like, free from the trammels imposed by the necessity for taking a man with you, which often involves preparation. I think that you ought to be able to carry any size up to a 10 by 8 and its belongings without much difficulty, and you should go boldly for that size for your more important pictures, for it takes the genius of a Sutcliffe or a Gale to make smaller pictures sufficiently good to force themselves to the front. Therefore the first point is that your camera is sufficiently portable for you to carry without distressing yourself. The second point is that it should be capable of being got ready for action in the shortest possible time. Subjects sometimes present themselves so suddenly and evanescently that you should be able to unlimber and fire without loss of time. This leads to the third point,—the construction should be simple and easily understood. There are cameras in the market so elaborately made, and so fearfully and wonderfully clever, that I have had to give up trying to learn all their tricks. Just as a serious study of chemistry is not necessary for a photographer, neither should it be imperative to pass an apprenticeship with a civil engineer in order to understand a bit of apparatus. As few screws should be used as can be helped, and none of them loose. The loss of a screw may cause the abandonment of an expedition. The arrangement for changing lenses should be extremely simple. Whenever the principle of the bayonet joint can be substituted for the screw it should be done. There should of course be a swing-back, and facility for taking upright or horizontal negatives. The focussing screen should be hinged, and should rack out far enough to admit of the use of a long-focus lens for taking near figures and portraits. Before we come to the dark-slides or plate-holders, there is just one thing to consider: what are you going to use—glass plates, films, celluloid, rolls, or any of the long *et cætera* of ingenious, past, present, and future inventions for getting rid of glass? It may help you to decide if I again remind you of our purpose, which is to arrive at picture making by photography in the most direct way, without experimenting to the right or to the left. The most recent inventions have their good qualities, but the glass plate is the most tried and certain, therefore we will adopt the glass plate. For plates you will want holders. Three, to take two plates each, will be enough and as many as you will care to carry. I prefer the solid form, with the slides made to draw quite out. It looks risky, but I never met with any difficulties.

I do not care for the old book-form of holders, it is needlessly complicated, takes more room on the table when open, and is more expensive than the solid form. In one of your holders have a carrier fitted to take either a quarter or half-plate. It sometimes happens that you want to try an exposure, as in copying and in taking interiors; a quarter-plate would answer the purpose and save a 10 by 8.

So you may note that a good camera for general use has three principal points—portability, simplicity, and facility for use. It must not be forgotten that ~~one~~ of these points must be gained at the expense of efficiency. For instance, it would be possible to make a camera so light and portable that rigidity would be sacrificed, or so simple that it would not work or enable you to do what you wanted. A camera without a swing-back would be very simple and also very useless. I could not get on without a swing-back, except in very small cameras. This would never do. The just medium must be maintained. I suppose it is of no use to protest against French polish. That detestable shiny finish has been at last abolished in our houses, or at least from all good furniture, just as stucco has been banished from the outsides of our dwellings. The taste of England is improving slowly, and the time may come when this in-artistic polish will no longer defile our scientific and artistic instruments or anything else. The "pride of the workshop" that makers still insist on putting into their work is perhaps not so objectionable as it used to be, but is still bad enough. Cabinet-making used to be thought of first, and the photographer's convenience afterwards, if at all. The backs of printing frames and dark-slides were made to fit so exactly that they would scarcely shut for the air they enclosed. The London maker refused to make them any other way, and the village carpenter had to take the pride out of them with a spokeshave. It was a great triumph when I got one of them to make a printing frame of pine instead of oak, and a camera of Honduras instead of heavy Spanish mahogany. I tell you these things that you may see there are at least some compensations to set against the vexation of having been born late.

PUPIL.—I pray you have me excused; it was not my fault.

PHOTOGRAPHER.—The camera stand should be light but firm. There are, I believe, more convenient methods of fixing the camera than the old screw arrangement, which is often a nuisance, but I have had no experience with them, and what I do not know I will not convey to you second-hand. With regard to lenses, there is no better all-round lens than those of the rapid rectilinear form. They are suitable for landscape, copying, and portraiture. There are others made for special purposes, including all widths of angle, from the very narrow—photographs taken with which look like bits cut out of a picture—to the very wide, which not only squint round the corners but turn molehills in the foreground into mountains.

PUPIL.—How is that?

PHOTOGRAPHER.—The narrow angle includes so little of the view that there is no room for the foreground. On the other hand, the wide includes so much that the ground almost up to the camera stand comes in and of course comes very large in proportion to the distance. Although you may have little use for it except at the sea-side, you should be provided with a shutter for quick exposures. Their variety is endless. Select one that gives moderate exposures, the very quick ones are useless for picture making.

PUPIL.—But what if I want to take jumping athletes, trotting horses, and birds on the wing?

PHOTOGRAPHER.—You may attend to that kind of trifling afterwards; it has nothing to do with picture making, which concerns itself only with what the eyes see. Yet if

you want to amuse yourself in the instantaneous direction you cannot do better than get a hand-camera. I am not much given to playing with toys, but I must confess that I have found myself deriving a considerable amount of pleasure from the use of one of these ingenious little instruments. Of other necessary appliances we will speak as we want them. To-morrow we will expose some plates.

(To be continued.)

Winter Work.—XX.

By T. C. HEPPWORTH, F.C.S.

HINTS ON ENLARGING.

(Continued from page 103.)

If the bromide paper process had not been introduced, it is doubtful whether the work of enlarging photographs would have come within the powers of the ordinary amateur, for all other processes by which magnified pictures can be obtained—if we except those within camera size—are either complex in their nature, or they entail apparatus of an expensive and cumbrous description. But the bromide process came to hand in the nick of time, and just when amateurs were being tempted to take up photography as a pastime by the ease and cleanliness of working which the gelatine plate inaugurated. The bromide paper process is easy to work, and in no part of it need the amateur fear any difficulty if he will only use ordinary precautions with regard to light access, exposure, and cleanliness in his manipulations. Under such conditions he will be able to produce from the smallest sized negatives pictures of which he need not be ashamed, and which will reveal beauties that were not suspected to lurk in the original.

The paper as now manufactured is so perfect that the amateur can start with the work with full confidence in the material with which he is about to deal. It was not so in the early days of bromide paper, for the makers had then much difficulty in finding a support for the emulsion which while possessing the necessary qualities as to toughness, etc., was free from deleterious matter which acted upon the delicate chemical coating. Hence it was then common for pictures taken by this method to present all kinds of blemishes. Sometimes a picture would develop rightly, and would afterwards become afflicted with an obstinate attack of measles without any discoverable cause. I fancy that many of the faults exhibited by the original material were traceable to the circumstance that a far larger proportion of gelatine was employed as a vehicle for the sensitive salt than was actually required, and certainly far more than is employed in modern bromide paper. The paper as soon as it was wetted became slippery and unpleasant to the touch, and the gelatine surface was very easily abraded. At the present time the gelatine is reduced to a minimum, and I fancy that little more is used than is necessary to bind the particles of silver bromide together, and to cause the emulsion to flow over the rollers during the coating operation.

To obtain a really satisfactory enlargement upon bromide paper requires care and some exercise of judgment. A thin and clear negative, of the kind which would not yield a very good print on albumenised paper, is just the sort to pick out for enlargement. Dense or very yellow negatives, which afford no difficulty in the ordinary printing frame, are, on the other hand, likely to yield hard black and white pictures when enlarged. Development can be brought about with either ferrous oxalate, hydroquinone, or the new agent eikonogen. Some say that the last named will gradually displace the other two, but I myself have obtained

such first-class results with the iron developer, that for the present I shall continue to use it in my own practice.

In using this ferrous oxalate developer, a common mistake is to employ too much of the iron salt. (I am assuming here that the amateur compounds his own developer, by mixing saturated solutions of potash oxalate and iron protosulphate together.) In developing a plate so as to produce a negative, the proportions generally recommended are four parts of oxalate to one of iron, with a liberal amount of soluble bromide. This will not do for developing enlargements on paper, except under unusual conditions. The proportion of iron to oxalate which I have found to work best is one of iron to eight of oxalate, the iron being added to the oxalate, and not *vice versa*. Some workers do not care to employ any soluble bromide, but I think that it is a wise precaution to add a mere trace to the mixed developer, for its presence tends to keep the whites pure. This comparatively weak developer will allow the operator to give a liberal exposure, and this is necessary to secure a good black tone in the finished picture. When the image is well developed—and the action must not be allowed to go too far, for the colour deepens in the fixing bath—the developer is poured off and the print is flooded, without previous washing, with water acidulated with acetic acid—strength, $\frac{1}{2}$ oz. to a pint and a-half of water. The paper picture must be next thoroughly washed, and finally fixed in the hypo bath—strength, $3\frac{1}{2}$ ounces to 1 pint of water. Allow the print to remain in the fixing bath for at least fifteen minutes, and take care, if two or three prints are being fixed at the same time in one dish, that they are constantly moved, so that one shall not prevent the salt attacking another upon which it rests. When fixation is complete, the paper appears translucent when held up to the light, but should any trace of cloudiness be apparent, it must go back in the bath until the paper becomes clear.

A word of caution is necessary here. If the paper print be left in the fixing bath for an extravagantly long period, the hypo will begin to attack the image itself, and the delicate details which form the most beautiful part of the picture will quickly disappear, never to return. This destructive action is quicker when a very small quantity of liquid is being used, and the surface of the paper in consequence gets exposed to the air while still in the bath. In former years it was frequently my lot to demonstrate in public the method of exposing and developing a bromide enlargement, and on one or two occasions while my attention happened to be absorbed upon other matters, a print which had been left too long in the hypo bath was spoilt in the manner indicated. It is possible that this accident may not occur with all makes of bromide paper, but I give a word of caution with reference to it, and am induced to do so because I have never yet seen in print the peculiarity referred to.

Many amateurs have told me that they have not tried to enlarge their pictures because they have no dishes suitable for the work, and the price of large ones is prohibitive to them. It is true that the larger sizes are expensive to buy, but it so happens that they can be made at home cheaply enough if the amateur can only do the work himself. The carpentry which the making of a dish involves is in truth so simple that it seems hardly necessary to employ a professional hand to do the work. Let me now give a few hints on the subject.

Dishes can be made in various ways, and some methods are far more simple than others. For instance, a good serviceable dish can be made of waterproof (Willesden) paper, the edges being turned up and the corners held together with strong letters clips. But this description of dish, if of large size, should stand upon a flat board, so that

its centre shall not sag and get out of shape. A really flat surface for the bottom of the dish is, in fact, for paper enlargements almost a necessity, for the wet paper will cling thereon, and the dish can be moved at any angle to coax the developer over the paper without fear of the latter falling off. Of course, dishes can be made of wood, and then covered with a waterproof coating. A really good dish can be made in this way, of pine, with a lining of mackintosh cloth. Or, if the carpentry be of a trustworthy character, the wood can be painted with some composition which will render it waterproof. The best compound for this purpose is gas tar, laid on sparingly with a brush while boiling hot. This is by no means a pleasant stuff to work with, and in case of danger from fire the work should be done out of doors. A dish so prepared will not be ready for some days, for gas tar has a tendency to remain sticky.

In the photographic year-books a waterproofing compound for dishes has been constantly published among the formulæ, consisting of a mixture of resin and beeswax. This I have tried, and found it difficult to apply and very brittle in use. It forms, moreover, a soap with any salt of soda, so that a dish so prepared and used for a fixing bath leads to mess and trouble. A far better mixture to use is asphaltum dissolved in naphtha, a dish so treated remaining for many years without alteration. For my part I prefer, above all other kinds of dishes, one with a flat glass bottom. They are not difficult to make, and I have several which have been in use for all kinds of purposes for many years. The sides of such a dish consist of $\frac{3}{4}$ inch pine, two inches in depth, with a $\frac{1}{4}$ inch groove cut along one face half an inch from the edge. This is for the reception of the bottom, which is made of thick glass, known in the trade as "32 ounce sheet." It is cemented into the groove with a mixture of white and red lead in oil, and after the sides are tacked together, the woodwork is waterproofed with any one of the mixtures just given.

(To be continued.)

Photographic Printing Processes. No. VIII.

BY ANDREW PRINGLE.

SINCE writing No. VII. of this series I have for my own memory refreshment, and for the benefit of my readers, carried out some experiments on the lines of my work of past years, and have further given as fair a trial as time and influenza would permit to a process presenting somewhat new features, and given in *Le Progrès Photographique*. I will first mention the processes of toning plain paper which on consulting my note-book and repeating old experiments I find to be satisfactory.

In the first place it may be said that an acetate toning solution such as given in a previous chapter will be found to yield very fair tones on plain salted paper, and the same precautions as were given under "Printing on Albumen Paper" will hold good here. If we require warm brown tones from "ready-sensitised" plain paper, we must neutralize the acid in the paper previous to toning. If our paper is home-made and alkaline, we must redden it before toning, by means, for instance, of common salt. But, as already surmised, when we use plain salted paper we probably do not wish for tones resembling those of albumen paper, but rather cold or blackish tones. The acetate bath may be made to produce tones decidedly cold, by starting to tone the prints in a violet state, and by prolonging the operation of toning considerably beyond the stage at

which we should stop it if we desired warm or brown tones. Much more effect may be produced in this direction than is generally known. The reader is requested to try for himself the effect of an acetate bath not too strong in gold and allowed to act for an unusually long time. But there are other toning solutions which will probably produce the desired cold or nearly black tones with more certainty and celerity and with less trouble; for instance, the following solution used by me some years ago, and suggested, I believe, by Mr. Schölzig:

Sodium tungstate	20 grs.
Sodium phosphate	20 "
Boiling water	3 ozs.

Dissolve the above, and add:

Gold terchloride	1 gr.
--------------------------	-------

When this is cool, add:

Water	5 ozs.
---------------	--------

If this bath acts too rapidly, either by reason of being too strong in gold for a new bath, or of being used before it is cold, the action will be only superficial and will be undone in the fixing bath. In such a case the solution must be either weakened with water or allowed to cool to a lower temperature. For rich dark tones, toning *must* be slow.

Slightly inferior to the above, but worth trial, is a bath such as is used for toning and fixing simultaneously certain gelatine-chloride papers. The following will serve as a sample, which I have tried with fair success:

Water	26 ozs.
Sodium hyposulphite	6 "
Ammonium sulphocyanide	1 oz.

Dissolve, filter, and add:

Water	6 ozs.
Gold terchloride	15 grs.
Ammonium chloride	30 "

It is almost essential, in order to prevent hurried and uneven toning with this bath, to put into the first part of the formula, before adding the gold solution, some scraps of printed plain salted paper, and to leave them there for some hours.

At one time I had great hopes of producing the tones I wished by the use of platinum chloride used acid in a solution either with plain water or with some organic salt. I cannot say I ever got any better tones with the platinum than with gold used as above described. If, however, any reader has a mind to try the platinum process, with the platonic salts, he should proceed to treat the commercial "tetrachloride of platinum" with sodium carbonate, to neutralise the free hydrochloric acid which would bleach the prints seriously. Having made the platinum solution alkaline, or, at least, neutral, he will then acidify it distinctly with nitric acid, and then it will be fit for use. A platinum solution for toning requires to be acid, and if an organic salt is to be used, I would suggest sodium phosphate. The following may be tried:

Sodium phosphate	30 grs.
Platinum chloride (treated as above)	1 to 2 grs.
Water	8 ozs.

The process of Mons. Gastine (*Le Progrès Photographique*, November, 1889) seemed to me to present some new features, and as its author claimed to produce black tones on plain paper by its use, I was led to give the process a trial as exhaustive as my time would allow. Very fine tones may be obtained by it, but not, so far as I can discover, black tones, nor anything like black tones. I

began by using the commercial platonic salt untreated, but the result was total failure. I then treated the platinum as above described, and got with ease tones that are not to be despised.

Sodium chloride	20 parts
Sodium bi-tartrate	10 "
Water at 50 degs. C.	300 "

When dissolved, stir in 5 parts of a 10 per cent. solution of platinum chloride; cool, then make up with water to 1,000 parts. Use at once. I find this solution keeps fairly well, and Mons. Gastine's instructions for strengthening the bath as it becomes weakened are: Add two or three parts of the platinum solution, and one or two parts of the bi-tartrate, in fifty parts of water. Though I do not put this process forward as excellent, still it is well worth trial by those curious in toning matters.

The great trouble with plain paper printing is the fact that the printing has to be carried to a great depth, and, no matter how deeply we print our proofs, there is always a great loss of the finer gradations of the image represented by the negative. In fact, the same objection may be taken to all the processes of printing involving free silver nitrate and toning; my own idea is that while so-called "silver printing" has its uses and its beauties, it has always, especially with the plain paper process, the serious defect of loss after printing. In this respect the platinotype and the bromide paper processes are far superior to albumenised and plain paper processes.

If I were intending to adopt plain-paper printing as my standard process, I should probably study the process lately worked out and promulgated by Mr. Lyonel Clark. He seems to get good tones and results generally satisfactory and fairly under command by a pleasing and simple series of operations. Mr. Blanchard also showed some good specimens of work produced by his process, but as he kept his chemicals and their proportions secret, I cannot offer any opinion on the process. I tried it carefully, but found it very expensive, even more so than would appear from the price list, for with me the solutions did not go nearly so far as the directions gave me to expect. The results were pretty good, much the same as will be obtained by the gold or platinum toning solutions suggested in this chapter.

In course of my experiments of some years ago, I got many curious results on plain paper by very lightly printing, in some cases not allowing the image to be more than suggested, and then developing with various acid developers, as iron, pyrogallol, etc. I even intensified developed images, and toned with acid platinum after development, but the results were never under command as to colour, and at best were only chemical curiosities. At the same time there is a fine field open for experiment in this line, for the developed image has far more gradation and far less loss of detail than the toned image on the same paper.

(To be continued.)

THE "PHOTOGRAPHIC QUARTERLY."—A correspondent writes, "Those who take an interest in artistic photography should be grateful to you for your enterprise in producing the *QUARTERLY*. Of the many excellent reproductions you have given us, I think 'Harmony' one of the finest. To look upon it is a source of both pleasure and profit."

"AMATEUR PHOTOGRAPHER" PRIZE PICTURES.—In connection with the *AMATEUR PHOTOGRAPHER*, Messrs. Hazell and Co. have issued, in a handsome wrapper, the first of a series of reproductions of "Prize Pictures," comprising five photographs by Mr. Alexander Keighley, with an essay on "Photography as a Recreation." They show not merely skill in the mysteries of focus and other details of technique, but a good eye for composition and expression.—*Daily News*.

Mounting.

By T. W. BACON.

PERHAPS in no branch of photography does the photographic apparatus dealer cater for his customers more meagrely than in this. The only requisites that he supplies satisfactorily are mounts and albums. The object of this paper is to draw attention to the defects in what he does supply, and to describe one or two things which he does not supply.

Mountant.—The necessary qualifications for a good mountant are the following:—(1) It must be of suitable consistency for being brushed on the print, must not be thin and runny, nor thick and treacley; it must not be lumpy nor contain bits of foreign matter. (2) It must not require the application of heat before or during use. (3) It must not cockle the mount, whether it be of cardboard or only paper, nor must it necessitate the application of pressure to keep the print flat after being mounted. (4) It must not in any degree affect the glaze on prints which have been dried on ferrotype plate, vulcanite, or glass, nor must it require the use of any backing for the prints. (5) It must keep well. (6) It must not injure the print. (7) It must be soluble in cold water, so as to be easily washed off the fingers, brushes, etc. Any mountant which fulfils these conditions may be used. The writer is only acquainted with one which does so, namely, that known as "Excelsior mounting solution." The first thing to be done on receiving a bottle of mountant is to carefully extract the cork, particular care being taken not to chip or break the cork so that pieces fall inside the bottle. Perhaps the cleanest way to do this is by means of a strong corkscrew. Next, the neck inside the bottle must be examined, and all pieces of adherent cork removed with a knife. If any should fall into the solution they must be picked out, or else they will afterwards appear as lumps between the print and the mount. Obviously, a corked bottle is useless for keeping the mountant in, as the above tiresome business would have to be gone through every time the bottle is opened for use, consequently it is preferable to turn the solution at once into a stoppered bottle. The best form for the purpose is that known as a "glass specimen jar," and the most convenient size made is $6\frac{1}{2}$ ins. high by $3\frac{3}{4}$ ins. in diameter. It is the same width at the stopper as at the bottom, and has the advantage that the solution is more accessible than when contained in a bottle with a shoulder. In order to prevent the stopper being stuck in the jar after use by the wipings off the brush, two pieces of thin wire, No. 36 or No. 38 B.W.G., should be passed at right angles to each other under the stopper, brought out between it and the neck of the jar, and their four ends tied round the handle, so that the stopper, when in its place, is kept away from the neck at four equidistant points in its circumference to the extent of the thickness of the wire. Should the stopper at any time be found to be fixed, it may easily be removed by warming the neck all round over a gas burner or spirit lamp. Care, however, must be taken not to re-insert it till the neck is cool again, otherwise it will stick in very tight on cooling.

Brush.—The reader is no doubt familiar with a small piece of stick about the size of a pencil, with a few bristles loosely fastened on to one end, which photographic dealers send out with each bottle of mountant, and which is supposed to be used in applying the mountant to the back of the print. This wretched thing may be with advantage consigned to the flames or sent to the nursery. The following are the necessary qualifications for a good mounting brush: it should be about an inch wide and an inch and a half long in the bristle, preferably flat in shape; the bristles should be well fastened in and not liable to come out with use; it

should have a good thick handle, so that the fingers do not become cramped from holding it. The most suitable form of brush for the purpose is that sold by dealers in fine art materials for oil painting, and known as a "hog-hair" brush. The largest, No. 12, flat shape, is the most useful size. After use, the brush should always be washed in cold water, shaken, and put aside to dry.

Print Holder.—As some force has to be used in applying the mountant to the print, it is necessary that the latter should be held down by some means in order to prevent it from slipping about and getting the front sticky. The accompanying illustration will show a simple and convenient holder, which consists of four legs and a handle made out of hard brass wire, No. 14 B.W.G. The legs are arranged to

fit on the print about one inch diagonally from each of its corners, and their lower ends are turned up so as to prevent the sharp points from injuring it. The stays between the legs are for the purpose of securing rigidity.

Mounting Supports.—After the mountant has been applied to the print, the paper or other support underneath will, of course, have become sticky from the brush going over the edge of the print, therefore the same support cannot be used again till it is dry, so it will be found necessary to have a supply of paper supports ready cut to a size allowing a space of about $1\frac{1}{2}$ in. all round the print. The commonest quality of paper will serve; that of which white paper bags are made has the advantage of being thin, and a few hundred sheets of this will take up very little room; each sheet may be used two or three times on each side, being allowed to dry between each time of using, and then thrown away.

Albums and Mounts.—These, especially the latter, are a matter of taste. As regards albums, prints no doubt are shown off best when mounted on cardboard leaves, a whole page being sacrificed to each print; but as albums made in this way as a rule only contain about thirty leaves, this method of storing photographs will be found to be a very bulky one; it is therefore preferable to reserve such books for first-class pictures only, and to mount the rest in larger books containing some six dozen paper leaves, each page being of sufficient size to hold two prints. In mounting prints on cards, allowing only a narrow margin round, the correct position can easily be judged by eye, but in the case of albums and cards with a wide margin, the following method is convenient: A piece of stout paper or cardboard is cut to the same size as the card or page of the album, two points are found by measurement on this paper where the two upper corners of a print of usual size should lie when in its correct position, and at these points, or $\frac{1}{8}$ in. nearer the middle of the page, two small holes are made through

the paper. Now before proceeding to mount a print, the paper is laid on the page of the album so that the edges of the former coincide with those of the latter all round; while in this position the point of a pin or pencil is pressed gently through each hole in succession, then on the paper being removed two marks will be found on the page exactly where the corners of the print should come; if the $\frac{1}{8}$ in. has been allowed, the corners of the print, when in its place, will just hide these marks. When a print has been considerably trimmed down, the correct position must be judged by eye from the two marks, and these obliterated as well as possible afterwards.

Various.—It is needless to say that mounting should always be conducted in a good light. If the prints and albums are large ones, it will be found convenient for the mounter to seat himself in an angle between two tables, with the album on one and the rest of the mounting appliances on the other, so that he has to turn in his chair through an angle of ninety degrees, in taking the print from the mounting support to the album; this avoids his stretching a long distance, as he would have to do when using only one table, and also gives him a better control over his work. The mounting support should on no account be placed on a soft substance, such as a table-cloth, or else the legs of the print-holder will make dents in the print; a smooth table or a well planed board of hard wood will form the best rest for it. The only other requirements are a couple of handkerchiefs.

Rehearsal.—Having provided himself with all the above mentioned apparatus, the mounter may proceed to work as follows: Place the print face downwards on the mounting support, so that there is an even margin of the latter showing all round; place the print-holder in its proper position, and hold it there firmly with the left hand; take the brush in the right hand, dip it in the mountant, and after wiping off the surplus on the edge of the jar, apply it to the back of the print; after dipping, remember always to do a few strokes first somewhere in the middle of the print; when doing the edges, draw the brush in a direction at right angles to them away from the centre of the print, *never* backwards and forwards across them, or the mountant will inevitably get on the face of the print; use as little mountant as possible, only sufficient to give the print a shiny appearance; if any bits of foreign matter, hairs, etc., get on the print, carefully pick these off with the edge of a knife; when the print has been thoroughly brushed all over, raise the print-holder and print, the latter will be found to stick of its own accord to the ends of the four legs, and quickly invert them; now take off the print with the right hand and put down the holder on its side in such a position that the sticky ends cannot pick up any dirt; lay the print on the mount, making the two upper corners coincide with the marks previously made, and leaving the lower part of the print for the moment lying somewhat loosely; take No. 1 handkerchief and wipe off any mountant that has got on the fingers; then with No. 2 handkerchief proceed to smooth down the print; fix the centre first, then press the handkerchief from it to each end in turn; do not smooth the whole length of the print at one stroke and in one direction, as this tends to create wrinkles; lastly, see that the edges and corners are well pressed down, and if any of the mountant has oozed out from under them, wipe it up with the handkerchief, or it may afterwards cause the pages of the album to stick together.

For the convenience of the reader it may, perhaps, be well to state where the necessities mentioned in this paper may be procured, and their prices. The Excelsior mounting solution from Houghton and Son, 89, High Holborn, W.C., 1s. per bottle. The brush, No. 12 hogshair,

from Muller and Co., 439, Strand, at 10d. The glass specimen jar from Townson and Mercer, 89, Bishopsgate Street, E.C., at 2s. The mounting supports from any stationer, who will cut for a few shillings enough to last for years. The print-holder may easily be made with some wire, a pair of pliers, and a soldering-iron; possibly No. 10 or No. 12 B.W.G. wire would make a more rigid holder than No. 14, used by the writer, and would not need to be turned up at the ends of the legs, if the points were carefully rounded off. For the benefit of those who have no tools, perhaps the enterprising Mr. Tylar might be induced to add this simple contrivance to his list of novelties.

Our Contemporaries at Home and Abroad.

L'Amateur Photographe (Paris) continues the articles on "The Products and Operations used in Photography," and "The Application of Photography to Industrial Arts." There are also articles on "Eikonogen" and "Practical Manipulations."

The *British Journal of Photography*, in an article on "Pictorial *versus* Microscopic Definition in large Direct Portraits," says, "It may require a little courage on the part of a professional to produce pictures which are even a little unsharp, and which may, in a photographic sense, be considered imperfect; but it is quite possible that the public for whom they work would really appreciate them. Anyhow, it might be worth the trial by those who are taking large portraits, and do not, at present, find them a commercial success." Articles: "The Explosion of an Oxygen Cylinder," "Damp, its Effects and their Prevention," "Light and Exposure Tables," "The New Benzoline Limelight," "Optical Illusions and Sights at Barnum's," "Some Phases of Amateurism," "The New Rollable Transparent Film," etc.

The *Photographic News*, amongst its notes, says, "The tercentenary of the invention of the compound microscope, which is to be celebrated this year at Antwerp, reminds us of the respectable age to which this instrument has attained. Of late years, microscopical appliances have been vastly improved, and the application of photography has given to microscopical study fresh interest and fresh power. Photographic attachments will make a large show at the exhibition proposed to be held, and among the subjects to be discussed at the inevitable conference will be photo-micrography." Articles: "Focussing Appliances," "Ashanarsius Kircher," "Photography in France," "Solubility of Glass Bottles," "Some further Application of the Ramsden Eyepiece to Photography," etc. It also contains a reproduction of the photograph by Colonel W. Noverre, of "Penzance Harbour."

The *Photographic Review* has, notwithstanding its self-announced decease, again made its appearance in the field, and we must congratulate it upon its improved form. It contains articles on "Amateur *v.* Professional," "Detective and Hand Cameras, and Work for the Same," "Art or Science," "General Remarks on Developers," etc.

The *Photographic Times* (New York) for January 31st contains an engraving of the accepted design for the Daguerre memorial. "It shows Daguerre crowned by Fame with the laurel which reaches around the globe; appropriately emblematic of the world-wide benefit which photography has been to mankind. The portrait of Daguerre is from an original daguerreotype furnished Mr. Hartley by Mr. Cramer. The monument, when completed, will stand eleven feet high. The pedestal and the globe will be of granite; the head of Daguerre, in bronze." In the February 7th number there are articles on "Eikonogen," "The Dangers of Flashlight Compounds," "How to Recover Metallic Platinum from Damaged Paper," "Old Developers and Waste," etc.

Photography, in an article on "The Separation Question," says, "One aim of an exhibition is doubtless to encourage artistic work, and individual efforts to produce pictures that shall be the best shown—in a word, the spirit of healthy artistic competition. But how does the separation movement aid this? It tends the other way, because, instead of having the finest professional work to excel, the competition is narrowed down to amateur efforts,

and a picture of less merit will suffice." Articles: "Some Notes on Exhibition Matters," "Development, Quick or Slow," "The Royton Exhibition," etc.

The *Scientific American* (New York) says, "Very pretty effects may be produced by printing on ordinary albumen paper, sensitised with the following solution: citrate of iron and ammonia, $3\frac{1}{2}$ drms., dissolved in water 2 ozs.; red prussiate of potash $2\frac{1}{2}$ drms., dissolved in 2 ozs. of water. Mix equal parts just before using, and float the paper on it for half a minute or so, and hang by one corner in the dark-room to dry. The prints can be mounted and burnished."

St. Louis and Canadian Photographer (St. Louis), in an article on "Why do we Retouch our Negatives?" says, "Retouching! Although the word is a misnomer it will probably abide with us to the end, and is much more harmless in its etymology than its practice. If one was asked to define it, he could hardly get nearer than by saying that it was something almost universally employed by photographers to impair and disfigure the image obtained in the camera." Articles: "Ordinary v. Orthochromatic Plates;" "A Novel Means of Remedying Certain Defects in Portraits;" "Pyrocatechin as a Developer;" "What shall we do?" "Composition of Pictures;" "Re-development," etc.

Wilson's Photographic Magazine (New York), in the article dealing with the frontispiece, "The Schwarzwaldlerin," says, "When the picture maker begins to see things in nature which the commonplace and unobserving do not notice, and to catch with his camera what he alone sees, then his productions increase in value. Hidden beauty is found, and its interpretations are presented by him through his pictures; then he astonishes his admirers by the revelation of unknown truths, and translates for them a language whose charms have been forbidden to them. And then he is looked upon as possessing 'poetic feeling.' As he goes on he becomes better and better enabled to bring forth the spirit of nature." Articles: "Amateur Photography;" "A New Photo-Lithographic Transfer Paper;" "Yellow Colouration of Negatives and the Remedy;" "Enlarging Processes," etc.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

THE meeting on the 13th inst. was devoted to the consideration of a paper by Mr. Graham Balfour, giving his views on the "Ethics of Pure Landscape," and it was a masterly exposition, couched in language worthy of the subject. The chair was occupied by the Rev. A. B. Whatton, and the attendance was a fairly good one, though it must be admitted that it need not have been surprising had there been a larger number of members present.

The reader, who, it will be remembered, about twelve months ago read another paper before the Club, started with the assertion there was a great field for photography in the direction of pure landscape, that is, landscape without figures, and he then devoted himself to the endeavour to prove that figures were in no way essential to the beauty of a landscape. It seemed plain to him, he said, that objects of human use fully compensated for the absence of their owners, though they must be instructive to be worthy of reproduction. The sentiment of a desolate scene was best shown by banishing all signs of human presence, while, on the other hand, the Great Sahara was best shown when given with a solitary human figure. The fact was that figures were often superfluous and discordant with the rest of the picture, and in such cases their omission was fully justified. It had been urged that figures were often put in the wrong place, and had, therefore, better be left out, and that photographers, being seldom artists, had better give up trying for the best results, as they would invariably fail. But nobody ought to abate one jot of the highest ideal he could set up, on the ground that it was very difficult to reach. If all the pictures produced hitherto were unnatural, the best thing they could do was to go on trying to obtain the best conceivable result. After dealing with the fact that the old masters were not landscape painters, he said that the enjoyment of scenery for its own sake was a purely modern growth, which our forefathers would not have understood. It was not until after the time of Pope that that love began to show itself. They had, therefore, this fact, that within the last hundred years there had grown up so universal a recognition of the external world

that no sensible man would venture to deny the domination of that sentiment. There was the sense of beauty which must be satisfied by all our pictures, and he thought it was sufficient to gratify that alone, and that was art for art's sake. In that view a picture was a work of art, and nothing more. It was none of the "ologies" and none of the "isms;" the results of those were illustrations in the first place, and only secondarily pictures. Surely art might exist for its own sake. As Browning said:

"If you get pure beauty and naught else,
You get about the best thing God invents."

Art devoted itself to satisfying our sense of beauty, interfering with no existing interest, looking neither to the right hand nor to the left in rivalry; and the best way to succeed in it was to do one thing at a time. If art were to succeed it must have its specialists, as well as other things. We did not get the full beauty of nature if we occupied our minds with other things. This view of art was like music, criticism of it was hopeless. Music and painting invented suggestions and vague yearnings which could not be set forth in words, but such art was manifestly only for the few. Many of them could only hope to get into the neighbourhood, but their efforts were likely to improve their taste. From those considerations he had come to the conclusion that if they got pure beauty and naught else they got as much as the camera could capture and more. He wished he could tell them how the sense of beauty was to be acquired; he believed it was by studying the best masters and nature herself in the true country. It was the eye that required cultivation rather than the mind. Their own instincts must lead them on. If they had no sense of symmetry, all the diagrams of Euclid would not help them. If, however, they despaired of pure art there was plenty of other honourable and good work to be done, but it must not be called pure art.

Mr. Humphery disagreed with the seeking of simple beauty to find pure art. That was one of the greatest curses of the present day to the photographer who looked simply for the pretty little landscape and nothing else, and be thereby degraded his art to one level and never rose above it. His opinion was that the highest study of mankind was man. Nature herself was life, and if they pictured nature without life they did not picture her as she was.

Mr. Greene took the other side of the question, and expressed his pleasure in the fact that someone had taken up the claims of pure landscape. He understood Mr. Humphery that pure beauty meant inane prettiness. That was not his view; he felt that the grandeur of the mountains and of the torrent were both beautiful and grand without mere prettiness.

Mr. Davison took the *via media*, and thought that the last speakers were of opinion that beauty must be sought in the grand, in the stormy wave, and so on. They might, however, have as much beauty in a simple landscape, a bit of meadow, dyke, and tree, with the sun across it or not, as in the grand scenery which had been referred to. Figures in action, or the attempt to represent them in action by time exposures, had failed. Where an instantaneous picture was taken, that unnaturalness, however, was often overcome, especially with a long-focus lens. They would all agree with Mr. Balfour when he said that art could have no didactic reason whatever—it then became more or less a science.

The subject on Thursday, February 27th, is "Photography as Applied to Medicine," when a paper will be read by Dr. C. S. Patterson. Meeting at 8 p.m.

ENGLAND'S CELLULOID FILMS.—We have received from Mr. J. D. England, of Charles Street, Notting Hill, sample celluloid films which, with the assistance of a piece of stiff cardboard, are easily adjusted to the ordinary dark slide. They are very carefully coated with the same emulsion as England's plates, are as easily developed, and of ordinary rapidity. From the samples we have seen, and trials made, we have no hesitation in commending them to amateur photographers.

MR. MARTIN, of Bream's Buildings, has sent us a specimen of his Autocrat Magnesium Magazine, which represents a convenient method of storing and measuring out a given quantity of the metallic powder for flash-light purposes. The apparatus is simply a reproduction of the old powder flask—with spring opening slide—which used to be carried by sportsmen before the days of breech-loading cartridges. Its application to the purposes of photography is a happy thought, and one which will, on account of its convenience, be adopted by many.

Societies' Meetings.

BIRKENHEAD PHOT: ASSOC.—The usual monthly meeting was held in the Association Rooms, Price-street, on the 13th inst.; the President, P. H. Phillips, Esq., occupying the chair. The "Enlargements" in the *AMATEUR PHOTOGRAPHER* competition were displayed round the rooms for the inspection of the members. Mr. H. J. L. Rawlins, who was expected to exhibit and describe his apparatus for the timing of photographic shutters, was unfortunately prevented from attending, but in the person of Mr. W. B. Beaton (Messrs. G. J. Atkinson and Son) he had a very able representative. After reading Mr. Rawlins' manuscript, Mr. Beaton dissected the apparatus, and showed the working of the different portions of the mechanism. In proposing a hearty vote of thanks to Mr. Rawlins and Mr. Beaton, Mr. Carruthers briefly described another "timing apparatus" he had had the pleasure of inspecting, in which the known vibrations of a tuning fork formed a basis for the calculation. A discussion on "Development" then followed, opened by Mr. H. Wilkinson, and sustained by Messrs. Lange, Carruthers, Forrest, and others; the President (Mr. Phillips) exhibited six negatives of the same subject, which, having received the same treatment exactly as regards exposure, had been developed by six gentlemen in their own particular ways and pet developers. It being generally remarked that there was little to choose between them, confirmed the President's statement that with a properly exposed plate one developer was as good as another. An exhibition of slides by the members followed, Messrs. H. H. Williams and F. Hope-Jones officiating at the lantern. During the evening attention was called to the exhibition of the *Photography* prize slides, in conjunction with the Liverpool Association, in the Exchange Sale-room, Liverpool, on the 18th February; and to the concert being arranged by W. H. Hunt, Esq., Mus. Doc., for the 28th February in the Cloughton Music Hall.

BIRMINGHAM PHOT: SOC.—The ordinary meeting was held on the 13th inst., W. Jerome Harrison, F.G.S. (Vice-President), in the chair. The Birkenhead Photographic Survey slides were advertised to be shown, but as these were not ready a very good substitute was provided through the kindness of the following gentlemen and societies, viz.: Mr. C. W. Hastings, Messrs. H. Sturmer and Drew (of the Coventry Society), the Camera Club (through Mr. Davison), the Leicester Society (through Mr. Bankart), and the Wolverhampton Society (through Mr. Evans), who each sent a number of slides for exhibition. Those from the Camera Club were the new set of animal studies, and were sent out with very appropriate readings of particulars. The new club lantern was on view, and at the close some pictures were passed through by Mr. E. H. Jaques. It was announced that Prof. Muybridge would give his exhibition at the Birmingham Town Hall during March.

BRIGHTON PHOT: SOC.—The first annual meeting was held on February 11th, the President (Dr. Rean) in the chair. The Secretary read the Committee's report, which stated that the society now numbered sixty members. It also referred to the papers read during the year, which have been of a high class, and evoked considerable discussion. The lantern evenings have also been a feature, and have proved most enjoyable. During the summer months excursions have taken place to the most picturesque spots in the vicinity; these have been thoroughly appreciated. Two interesting competitions have also taken place, one for the best set of lantern slides being keenly contested. The officers for the current year were then elected as follows:—President, W. K. Rean; Vice-President, W. Page; Treasurer, J. P. Slingsby Roberts; Committee, Messrs. Bedford; Caus, Hardcastle, Graham, Perren, Mitchell, Tate, Webling, and Wicks. Hon. Secretary, A. H. C. Corder (42, Montpelier Road, Brighton). The prints sent in for competition were on view during the evening; the judges, Messrs. Allen, Fry, Hunter, Graham, and Rean, awarding the bronze medal to Mr. W. Durdell; the silver was withheld, as, in the opinion of the judges, there were no exhibits of sufficient merit to justify their awarding it.

BRISTOL CAMERA SOCIETY.—On Thursday, the 13th inst., an ordinary meeting was held at the University College, Professor Ryan, M.A., in the chair. The President of the Society (Mr. Harvey Barton) gave an instructive paper on "Lantern Slide Making," and afterwards exhibited, by means of his lantern, a large and varied selection of slides. At the close of the exhibition several questions were put to Mr. Barton on various matters con-

nected with the subject, and were replied to. At the next meeting, on the 27th inst., the Secretary (Mr. T. Taylor Genge, L.D.S.) will give a demonstration on the "Cold Bath Platinotype Process."

BRIXTON AND CLAPHAM CAMERA CLUB.—The last meeting of this club was held on Friday, the 14th inst., and was devoted to the reading of papers from the journals and to discussion of the same. A member showed one of Watson's "Acme" cameras, which was examined with much interest. The next meeting (28th) will be a lantern night, when a special set of competition slides lent by the editor of *Photography* will be shown.

DUNDEE AM: PHOT: ASSOC.—The annual meeting was held last week in the Forfar and Kincardine Hall, when there was a large attendance. Mr. J. Rogers, President, occupied the chair, and spoke of the interest to be found in the study of photography. There was a very enjoyable concert. The society, which is composed mainly of working men, is making considerable progress.

DEWSBURY AM: PHOT: SOC.—On February 6th an exhibition of prize lantern slides was held in the Industrial Hall, the Mayor, Alderman Geo. Clay, presiding. Mr. C. Naylor operated the lantern, and the President, Mr. T. G. Beaumont, announced the subjects shown on the screen. The pictures which were most appreciated were the cloud, genre portraiture, scientific, and animals. The slides, taken on the whole, were considered first-class, and equal to anything ever shown in the town before. After the prize set had been put through the lantern, a number of slides made by members were shown. The monthly meeting was held on February 13th, Mr. T. G. Beaumont in the chair. After passing minutes of previous meeting, the Secretary read letters from the Crystal Palace Company *re* exhibition, and P. H. Emerson, offering a copy of his work, "Pictures of East Anglian Life." The Society decided to accept the copy. It was resolved to hold a complimentary social evening on Tuesday, March 25th, the entertainment to consist of music, exhibition, photographic apparatus, stereoscopes and transparencies, lantern slides, etc. A number of stereoscopes were placed on the table, and a goodly number of transparencies were exhibited by several members, and were greatly admired.

FORMBY CAMERA CLUB.—On Monday evening, the 10th Feb., a conversazione in connection with the Formby Camera Club was held in the Victoria Hall, Freshfield, when there was a good attendance of ladies and gentlemen interested in photography. The principal feature of the evening's entertainment was the opportunity afforded to the members and friends of inspecting a number of enlargements lent for the occasion by the Editors of the *AMATEUR PHOTOGRAPHER*. Most of the exhibits were very fine specimens of amateur work, and were very much admired. In addition to these, the President (R. E. Maclean, Esq.) exhibited some enlargements of local views which were neatly finished, and very creditable pictures in every respect. The Rev. W. F. Warburton, of Altcar, presided at the lantern (limelight). A number of capital slides, lent by Mr. Swinden, of the Liverpool Photographic Society, were first thrown on the screen, additional interest being centred in them by the different subjects being connected in a very ingenious manner by means of a letter supposed to be written to a friend detailing the events that happened whilst on a holiday visit to Liverpool and neighbourhood, during the celebrations of Jubilee week. About forty miscellaneous slides of exceptional merit, kindly lent by Mr. A. W. Beer, of the Liverpool Club, were next shown, and gave great satisfaction. These were followed by some local scenes in Formby and Freshfield. A set of microscopical slides were exhibited by the Rev. W. F. Warburton. At the close of the proceedings the President proposed that a hearty vote of thanks be accorded to the Editors of the *AMATEUR PHOTOGRAPHER* for the Enlargements, and to Messrs. Swinden, Beer, and Warburton for the loan of slides.

HACKNEY PHOT: SOC.—On Thursday last Mr. G. H. Slight read a very interesting paper on "Past Photography," Dr. Gerard Smith presiding. The lecturer, a veteran, gave his personal recollections, mentioning how he once paid sixpence to see a daguerreotype, and thought it a most wonderful thing. He gave a short history of the discovery, tracing it through Niepce, Daguerre, and Mungo Pontin's time up to the present. He preferred the wet-plate process, notwithstanding its dirtiness. Dr. Gerard Smith moved a vote of thanks. He preferred the old process, which evidently still remained on the minds of some people who advertised "results like wet plates." There was no amateur then who kept changing his plates and formula every day. He said the grain too of the wet plates was close, which

in the present dry plates was missing, as, when enlarging, the dry plates had all their faults enlarged too. The Secretary announced an exhibition of apparatus on the 27th. He said he thought members were always glad to hear of their fellow members' success, and said Mr. Hubert had secured the Royton silver medal for his "Happiest Land." Mr. Hart showed the flash-light group he had taken at the preceding meeting. Mr. Dean showed micro-enlargements. The Secretary said he had been trying pyrocathechin, but had found no advantages. It was far too slow to be of any use, and testing it for non-actinic qualities had obtained fog with Iso plates and yellow light. Using Dr. Arnold's formula, as advised, diluted, in one hour had obtained no result. Dr. Birtacres was nominated as a member.

HEREFORDSHIRE PHOT: SOC:—A meeting of this society was held at the Mansion House on Thursday evening. Mr. John Parker, the Hon. Sec., took the chair at the urgent request of those present. Mr. Parker explained the construction of the Kodak camera, an American invention, a specimen of which he exhibited and described in detail. The instrument, he said, was a very good one, and it was being still further improved upon. The Chairman next moved that an album be purchased out of the society's funds for presentation to Hereford Infirmary, each member to be invited to contribute prints thereto. Mr. Clarke seconded, and several of the members expressed approval of the proposal, and it was agreed to. Mr. Payton Levason suggested that some time in the course of the year the society should hold an exhibition, make a small charge for admission, and devote the proceeds to some charitable object. Each member should send a certain number of prints, and the society give a prize for the best group. The subject was discussed, and eventually adjourned for consideration at the next meeting. The Chairman said he had received a letter from the Shropshire Camera Club inviting this society to meet them in an outing in the summer at Ludlow, Wenlock, or other place that might be fixed upon by this society. There was a similar invitation from the Gloucestershire Photographic Society. Both matters were postponed till the next meeting.

HOLBORN CAMERA CLUB:—The last meeting was held on Friday the 14th inst., the subject for the evening being Mr. Traill Taylor on "Lenses." A large number of members assembled at the club rooms to hear him, but owing to the annual general meeting of the P. B. A. (of which body Mr. Taylor is Chairman) falling on the same evening he was (greatly to the regret of the members of the Holborn Camera Club) unable to be present. However, Mr. F. W. Edwards, of Dulwich, who was luckily in the room, stepped into the breach and delivered a most instructive and interesting discourse on the subject of lenses, their uses and abuses. We are sure all those who were present had considerably increased their store of information on the subject at the conclusion of Mr. Edwards' remarks. After a vote of thanks to Mr. Edwards for his kindness, Messrs. Miller and Lupton were proposed as members of the club. On Friday next, the 21st, Mr. E. Clifton will deliver a lecture on carbon printing. Visitors (ladies especially) will be very welcome. For the information of gentlemen contemplating joining this club, we may say that subscriptions for the coming year will not fall due till March 30th. After a vote of thanks to the Chairman (Mr. Lowe), the meeting was brought to a conclusion.

IPSWICH PHOT: SOC:—The usual monthly meeting of this Society was held on the 12th inst., in the Unitarian Schoolroom, Mr. W. Vick (in the absence of the President) presiding. There was a large attendance of members, the occasion being rendered additionally interesting by the declaration of the result of the lantern-slide competition. Fourteen sets had been sent in by members, and these had been submitted to the Rev. E. Ledger, of Barham, who officiated as judge. His decision awarded the first prize, of a silver medal, to Mr. R. Cash, and the second, a bronze medal, to Mr. Evan Edwards. After the announcement of the result of the competition, the slides were exhibited by the aid of a lantern. A marked improvement in the work of the members was to be noticed, many of the slides being really of first-class merit. Mr. E. Pringle (the Secretary) superintended the lantern, which had been kindly lent for the occasion by Mr. W. H. Booth. A vote of thanks to the Chairman concluded the meeting.

LANCASTER PHOT: SOC:—A meeting was held on the 11th inst. Dr. Jumeaux gave an interesting demonstration on "Eikonogen as a Developing Agent," and using for the purpose

his own single solution and two solution developers. Negatives (both instantaneous and time exposure) were developed, as also were opals and bromide prints, all turning out exceedingly well. The members expressed themselves perfectly satisfied and much pleased with the results obtained. It was proved to work more easily and energetically than other developers, besides being under better control. Dr. Jumeaux received the unanimous thanks of the members present for his demonstration. The next meeting will be held on Tuesday, March 11th, when fifty lantern slides, lent by the Editors of the AMATEUR PHOTOGRAPHER, will be exhibited.

LEICESTER AND LEICESTERSHIRE PHOT: SOC:—A regular meeting of the above Society was held in the Mayor's Parlour, Old Town Hall, on the 12th inst., Mr. J. T. Cook, Vice-President, in the chair. There was a good attendance of members. The minutes of the last regular meeting, held January 8th, were read and confirmed; the ballot was taken for one member, who was unanimously elected, and one proposed and seconded for ballot at next meeting. It was resolved to apply for the loan of the prints offered by the AMATEUR PHOTOGRAPHER. The exhibition of lantern slides for competition in class A. was then proceeded with, Mr. F. Pierpoint manipulating the lantern. Eight members sent in six slides each, which after being passed through the lantern were voted on by ballot by the members present, with the result that the first prize silver medal was awarded to Mr. Porritt, and the bronze medal for second prize to Mr. W. Joliffe. A vote of thanks to Mr. Pierpoint for the loan of the lantern and useful attention, was awarded, and with which the meeting adjourned.

MANCHESTER AM: PHOT: SOC:—The monthly meeting of this Society was held on the 11th inst., in the Athenæum, Mr. J. Davenport, the newly-elected President, in the chair. Twenty-two members were elected, and the President and Secretary of the old Manchester Photographic Society were made honorary members, in response to a similar act of courtesy paid to this Society. Mr. Davenport, in thanking the members for the honour they had conferred upon him, gave a résumé of the history of the Society. He was glad to see several of the original promoters still taking an active part in the management of it. He took office with everything prosperous and promising. In 1886 the balance in hand was 3s., in 1889 it was £44 10s. In addition to this they had a library of over 250 volumes of photographic literature, and a valuable oil and lime-light lantern, elevator, screen, enlarging lantern, and cabinet of slides. The Society stood with assets of upwards of £100 and no liabilities. The Society's magazine, the *Record*, was profitable financially as well as photographically. Looking forward to the work of the Society, they were likely to have a busy year. But the chief would be the Photographic Survey of Manchester. The Council were beginning in earnest, and he hoped by the end of the season the greater part of the work would be completed. Mr. Wilcock, 335, Moss Lane East, was the Secretary to the Survey Committee, and after they had finished with the exhibition this week the scheme would be begun forthwith. Meantime Mr. Wilcock would be glad to communicate with anyone willing to take part in the survey. The Rev. H. J. Palmer gave his experience of the new Angol developer, and exhibited two enlargements by it. He spoke in the highest praise of it, and considered it the finest and best all-round developer before the public. An animated discussion followed on the subject of "Exposure Tables." Mr. Gilmour, in the absence of Mr. Steventon, read a paper selected from a periodical, condemning these tables as "degrading and misleading formulæ," but recommending the use of them for about a week, during the first attempts at photography, just to prevent waste of plates. It was unfortunate that Mr. Steventon could not be present to defend his position, as there were few to take his part. Messrs. Wheeler, Sykes, Parrott, Davenport, and Gilmour spoke in favour of Tables, while Messrs. Hart, Brooke, and Furnival argued that they attempted more than it was possible to tabulate, though they might be used to advantage during first attempts.

MONTROSE PHOT: ASSOC:—The monthly meeting of the above association was held on the 14th inst., the President (Mr. Ferrier) in the chair. Mr. Ross, the energetic Secretary of the Brechin association, read a very instructive paper on "Lantern Slide Making," and illustrated his remarks by showing a great variety of slides with the limelight lantern. After the customary votes of thanks the meeting terminated.

NEWCASTLE-ON-TYNE AND NORTHERN COUNTIES PHOT:

Assoc :—The annual meeting was held on Tuesday evening the 11th inst., in the Mosley-street Café, Newcastle-on-Tyne, Mr. J. P. Gibson in the chair. The election of officers was as follows : President, A. S. Stevenson, J.P. ; Vice-Presidents, J. P. Gibson and H. R. Procter ; Council, M. Auty, James Brown, T. Galloway, J. E. Goold, W. Parry, G. Proud, H. G. Ridgway, J. Hedley Robinson, H. Shand, and L. Williamson ; Hon. Treasurer, J. W. Robson ; Hon. Sec., Edgar G. Lee (11, Beverley Terrace, Cullercoats). The Treasurer's report showed a balance in hand of £2 13s. 3d. Mr. J. E. Goold read a paper on "Four Different Printing Processes suitable for Copying Tracings." Other printing processes were described by Messrs. M. Auty, James Brown, J. P. Gibson, W. Parry, and J. Pike. Some very fine photographs by Mr. Robert S. Redfield, Philadelphia, were exhibited by Mr. J. P. Gibson. Messrs. M. Auty, Jas. Brown, J. P. Gibson, J. E. Goold and W. Parry exhibited a number of photographs the work of the past season.

NORTH MIDDLESEX PHOT : CLUB.—On Monday, February 10th, the members of the above Club spent the evening in discussing the best light for use in the dark-room, and submitting several samples of glass to a practical test. For this purpose pieces of Ilford rapid bromide paper were used, and an exposure of ten minutes was given. Mr. Paul remarked that at previous meetings of the Club, when he had recommended cathedral green to be used, he had never advised that it be used alone, but in conjunction with a screen of canary medium, and expressed his belief that if forty thicknesses were used it would still be easy to fog a plate. Mr. Goodhew remarked that he should like to call attention to the fact that the safety or otherwise of a particular screen was largely influenced by the make of lamp. The Secretary said that in choosing a light to work by we had the choice of two evils—either it was necessary to have a light that was practically, if not absolutely, *no* light (if it was desired to have one that would have no effect upon the sensitive film, however long exposed), or a light which, while promoting ease of working, would cause fog if allowed to act for a comparatively short time : and therefore it was necessary under these conditions to choose one which hit the middle course ; that is, a medium which would not show any trace of fog with the longest *necessary* exposure on the most sensitive plates. Anything which cut off more light than this was not only needless, but was an actual disadvantage and detrimental to the best results, as nothing was more necessary than a good light to judge the negative by in developing, and for this reason he objected to such screens as had a mottled appearance (as cathedral green), as he opined that it made the judging of fine detail more difficult, and remarked that all knew the nuisance of emulsion on the back of a negative. The vote of the meeting was taken, when it was found that canary medium and yellow glass were the favourites. The thanks of the meeting were tendered to Mr. Lavanchy for conducting the tests. Next Monday, February 24th, Mr. Geo. Davison, of the Camera Club, will give a lecture entitled "A Chat on Pictures by Photography." Visitors are invited to attend.

PAISLEY PHOT : SOC :—A conversazione in connection with the opening of the photographic exhibition took place in the Picture Gallery of the Free Public Library and Museum on Wednesday, 12th inst., when there was a large attendance of members and friends. Owing to the indisposition of Mr. James Donald (President), Mr. Matthew Morrison took the chair. He expressed the pleasure it gave him to see such a large number present, which showed the interest taken in matters photographic by the public. He stated the number of members of the Society was steadily increasing, and as he knew there was a very large number of photographers in the town who were not members, he would give them a most hearty welcome to join the Society, and thus assist in the development and advancement of the art of photography. Through the kindness of Mr. Smiley (Hon. President), Mr. Donald (President), and Mr. Frank Wotherspoon, they were enabled to offer extra prizes for competition, and while in one or two classes there was keen competition, he was sorry the others did not come up to expectation. He supposed this was owing to the lateness of the season before they were classified, and the number of wet Saturdays they had during the summer. He believed, however, if these gentlemen were to offer the same prizes again another season, there would be a larger number of competitors. Mr. Geo. Mason, Mr. William Lang, jun., and Mr. John Fullerton had kindly acted as judges in the competitive classes. The following were the prize takers :—Landscape and architecture, Matthew Morrison, James Mure ;

portraits or groups, Robert Easton, Thomas Rastall ; photographs taken during the Saturday excursions, James Mure ; instantaneous or marine work, James Donald, jun., David B. Jack ; lantern slides, Thomas Rastall, James Mure, and a third prize was recommended to be given to Alexander Kilpatrick. At 8.30 the company proceeded to the Lecture Hall, where a lantern demonstration was given, 240 slides being shown on the screen by the oxy-hydrogen light. Fifty were from the York Society, fifty from Dundee Society, sixty-three competitive slides, and seventy-seven from Mr. R. M. Paterson, the whole of which were very much appreciated by the company. Those shown by the societies being so varied, gave them additional interest.

PHOT : SOC : OF IRELAND.—The annual general meeting of this Society was held in the Rooms, 15, Dawson Street, Dublin, on Friday evening 14th inst. The chair was taken at eight o'clock by Geo. Mansfield, Esq., J.P., president. The resignation of Mr. Mathew Hedley, Hon. Sec., on account of the delicate state of his health, was received, and on the motion of Mr. Louis Meldon, seconded by Mr. J. J. Dowling, was accepted with regret. A vote of thanks to Mr. Hedley for the efficient way in which he discharged the arduous duties attached to the post and the uniform courtesy which he displayed to members on all occasions was proposed by Mr. Woodworth, seconded by Mr. Blakeney, and passed unanimously. The annual report was then read by Mr. Carson. It was proposed by Mr. W. Robinson, seconded by Mr. Woodworth, and passed unanimously, that the report as read be adopted. Mr. Louis Meldon announced that Prof. Muybridge would deliver his lecture, under the auspices of the Society, on "Animal Locomotion," illustrated by the "Zoopraxiscope," on Monday, the 17th inst. in the Antient Concert Rooms. On account of the lateness of the hour it was decided that it would not be fair to ask Prof. Stewart to read his paper, which was accordingly adjourned to the next meeting.

SHEFFIELD CAMERA CLUB.—The election of officers of the above Club took place on the 27th of January, when the following gentlemen were elected :—G. T. W. Newsholme, F.C.S., President ; T. H. Morton, M.D., and J. H. Rawson, Vice-Presidents ; B. W. Winder, F.C.S., F.R.M.S., Treasurer ; G. E. Maleham, Hon. Secretary ; Council : W. Gilley, jun., W. Jenkinson, Prof. Arnold, H. Newell, J. A. Manton, L.R.C.P., M.R.C.S., and T. S. Yeomans. The inaugural meeting of the new session takes place on February 26th.

SPEN VALLEY PHOT : SOC :—A general meeting of the members of this Society was held on Tuesday the 11th inst., under the presidency of Dr. Farrow. The following gentlemen were appointed officers for the ensuing year :—President, Dr. Farrow ; Vice-Presidents, Mr. B. H. Goldthorp, Mr. Bell, Dr. John Sykes, and Dr. Dearden (Wyke) ; Treasurer, Mr. E. Smith ; Secretary, Mr. W. H. Wright ; Council, Messrs. A. Knowles, E. Hodson, J. C. Phelon, S. Blackburn, E. Hirst, A. Cooper, G. H. Dawson (Cleckheaton), J. W. Pitt (Liversedge), and H. Wilson (Lowmoor). It was decided to rent rooms at the coffee tavern for the use of the members ; rules were adopted, and it was decided to hold the ordinary meetings of the Society on the second Tuesday in each month. It was reported that the Society was meeting with much support, and the Council was empowered to fit up the premises, and purchase enlarging and other apparatus required.

ULSTER AM : PHOT : SOC :—The fifth meeting of the session was held in the Chemistry Class-room, Queen's College, on the 10th inst., Mr. C. C. Connor, Mayor of Belfast, in the chair, Professor Letts, President of the Society, delivered a most interesting lecture on "The Chemistry of Photography." The lecture was illustrated with a number of experiments, some being very elaborate and never shown in Belfast before. The lecturer first considered the blackening of silver chloride by light, and showed by experiment that chlorine is set free. The blackened substance, he said, was probably an oxy-chloride. The relation of the sub-chlorides of silver to photography in natural colours was explained and illustrated, and red and purple "photo salts" of silver, prepared without the action of light, were shown. The making and ripening of gelatine emulsion was then taken up. At the conclusion of the lecture the Mayor thanked Dr. Letts for the most interesting and thorough way in which he had dealt with his subject. A vote of thanks to the Mayor terminated the meeting.

WEST SURREY AM : PHOT : SOC :—A meeting was held on the 12th inst. The subject for the evening was to have been "The Chemistry of Development," by Mr. F. H. Smith, who was, however, prevented by business from being present. Another member

had consented to fill the breach, but he was called away at the last moment, when Mr. Davison, without any previous preparation, kindly stepped into the chair, and gave a capital lecture on "Exposure and Development," which was followed with interest by all present, several members taking part in the discussion. Mr. Graham brought up for inspection some prints from the negatives taken, by the flash-light lamps of his own manufacture, at the previous meeting.

WOLVERHAMPTON AM. PHOT. SOC.—The monthly meeting of the above Society was held in their rooms on Tuesday, February 11th, Mr. T. Ironmonger, the President, in the chair. Mr. H. E. Perry gave a demonstration on "Chloride v. Bromide Emulsions for Lantern Transparencies," practically illustrating the great difference between the composition of the plates of various makers and the great difference of time required for their exposure, afterwards showing by means of the lantern the great variety of tones that can be produced. His remarks and successful experiments were much appreciated by the members and their friends, of whom a good number were present. After Mr. Perry's demonstration was finished, a number of exquisite lantern slides, belonging to and kindly sent by the Ilford Dry Plate Company, were shown, and much admired; also three varieties of prints. A vote of thanks to Mr. Perry, proposed by the President, and seconded by Mr. Oakley, brought a very instructive meeting to a close.

WYLDE GREEN CAMERA CLUB—The first annual exhibition in connection with this society took place at the Town Hall, Sutton Coldfield, on Friday, January 31st, and Saturday, February 1st, when an interesting collection of photographs, numbering about 180, was on view to members and friends. Prizes were offered by the club for two competitions, open to members only. First: prize for the best print from a negative on an Ilford plate. The judge, Mr. E. C. Middleton, of the Birmingham Phot. Soc., awarded the prize to Mr. C. J. Fowler, for his platinotype print, entitled "Childhood's Happy Hours." "A Garden Pond" (silver), by Mr. T. Hooper, was mentioned as being a very good study of foliage. Second: prizes for the first and second best sets of three pictures. The first prize was taken by Mr. W. Betts, for three Welsh views, on Obernetter paper; these were closely followed by three local views (platinotype) by C. J. Fowler (second prize), the works exhibited in each competition being of very fair merit, the exhibitors mostly having only taken up photography some two years. Mr. G. H. Dugard, Vice-President, exhibited a collection of charming flower pictures, coloured by hand, on a photographic basis, also a number of copies of celebrated engravings, photographed about twenty years ago and in perfect condition. A number of members and friends attended the opening of the exhibition on the Friday evening. In opening the proceedings the President, J. B. Stone, Esq., delivered an address of a very practical character, upon amateur photography. In concluding his remarks he said that much of the success of the exhibition was due to the Hon. Secretary, Mr. W. F. Sadler, jun., who had worked in conjunction with his friend, Mr. C. J. Fowler. An oxy-ether limelight entertainment was given each evening, when some views of Rome were shown and described by Mr. J. Coley. A collection of views, "In the Potteries," by W. Betts; "In the Isle of Man," by H. Bilson; "Local and General Scenery," by C. J. Fowler; a collection of views kindly lent by the Editors *AMATEUR PHOTOGRAPHER*, a number of views kindly lent by the Britannia Works Co., Ilford, also added greatly to the enjoyment of the lantern entertainments.

(Several Societies' Meetings are unavoidably held over.)

PHOTOGRAPHING IN TURKEY.—The Austrian painter Adjukievitch, who has sprung into great renown as a painter of horses, has been commissioned by the Sultan to paint a picture representing a galloping troop of these quadrupeds, but with not a single human figure on the canvas. The Sultan holds very strictly to the Mussulman law, which forbids the depicting of the human form, and he has never consented to sit for his photograph. Not long ago a German photographer at Stamboul got into serious trouble for endeavouring to take an instantaneous photograph of his Majesty as he was going to the Mosque. The gendarmes fell upon the unlucky man, smashed his instrument, and carried him off to prison, where he lay three weeks. After this he was bidden to depart from the Turkish coasts, and was not allowed so much as twenty-four hours in which to wind up his business.—*Edinburgh Evening News*.

Exhibitions.

ROYTON EXHIBITION.

AN "International Photographic Exhibition" was opened in the Town Hall, Royton, on the 5th inst., in aid of the Church Restoration Fund, and remained open until yesterday, February 20th. It has been got together mainly by the exertions of the Rev. J. G. Gibson, who has been aided by many friends, especially from the neighbourhood of Newcastle, Mr. Gibson being an old member of the Newcastle and Northern Counties Photographic Association. A capital list of awards has been arranged, including no less than twenty-one classes, with a silver and bronze medal for each, amongst them being champion classes for amateurs and professionals, with gold and silver medals.

In the great majority of the classes amateurs and professionals do not compete together, and in the amateur classes the photographs must be "entirely the work of a bona fide amateur—selection of subject, exposure, development, retouching (if any), printing, toning, and mounting," and amongst the rules appears this: "No photograph or series of pictures which have gained first prizes or medals at any open competition will be eligible for competition, except in classes XX. and XXI., though they will not be debarred from exhibition." It will be seen that the conditions are favourable to fair competition, and a capital exhibition has been got together, some of our leading amateurs and professionals sending specimens of their best work. The exhibition fills two rooms in the Royton Town Hall—we may say overfills, as many good pictures have been "skied"—and contains 465 exhibits sent by 73 amateurs and 43 professionals, besides some 47 sets of lantern slides, which our space does not permit us to notice particularly. As 42 medals have been awarded amongst 107 exhibitors the number cannot be considered unduly limited, and that these have been pretty evenly distributed is evidenced by the fact that only Messrs. Austin, Beck, Cole, Gibson, Kitchin, H. P. Robinson, and Sutcliffe have each obtained two.

Class I.—(Landscape or Seascape for Amateurs only) is represented by 65 exhibits. The silver medal is awarded to J. E. Austin for Nos. 18, 32, 34, 38. "The Silver Stream," upon which the prize label is placed, is badly skied, but reminds us very forcibly of Gale's "Sleepy Hollow;" the others are, "Strictly Preserved" (a Norfolk Broad), "Shiere," and "A Golden Summer," which last strikes us as the best of the series. The bronze medal is won by C. Court Cole, for three landscapes, of which sunset effect, with sheep, is exceptionally good. Several pictures, by Ernest Beck, of Whitby, are decidedly good. Nos. 59, "On the Basingstoke Canal," and 28, "View near Fleet," by F. Muncey, are good specimens of bromide printing. No. 42, by the Rev. H. B. Hare, "The Young Fisherman," is a picturesque subject. No. 32, "Neddy Won't Go," by the same, is spoilt by the too pronounced movement in the trees. His others are "Low Water," "The Cooling Stream," and "River Scenery on the Frome." Amongst others worthy of notice in this class are Nos. 23, "Hand Camera Work," by H. Tonkin, and "Views in Monsall Dale," by Tom Heywood. Why will amateurs print on pink paper? Surely the garish effect might be left to the cheap professional.

Class II. (Landscape and Seascape—Professional) is well represented. Nos. 118, "Head of Buttermere," 123, "Buttermere;" and 136, "Study of Cattle, Thirlmere," by Green Brothers, are too much skied for being well seen, but are good. The silver medal goes to J. Pike for "A May Morning," which strikes us as rather flat and wanting in atmosphere. J. P. Gibson gains the bronze medal for No. 119, "September," printed in Blanchard's platinum black, which again is badly placed for close inspection, but we think we should have reversed the verdict of the judges. F. M. Sutcliffe is highly commended for several pictures, "A Wet Harvest," "Lingering Gleams of Sunshine," and "The Fast Declining Day," all good. A striking picture is No. 130, by Clarence James. "The sky is changed! And such a change! Oh night and storm and darkness!" but marred by the too deep shadows.

Class III. (Portraiture—Amateur) does not call for much remark—portraiture is perhaps not the branch of the art in which amateurs most excel. No. 296, by Samuel Butler, gains the

silver medal, and is a well composed portrait of a child. Nos. 276 and 285, by the same gentleman, are also above the average. Alfred Stieglitz receives a bronze medal for three portrait studies.

In Class IV. (Portraiture—Professional) Messrs. W. J. Byrne and Mendelssohn are well to the fore, so is the professional retoucher. The former is awarded the silver medal for a frame containing 40 portraits of children, whilst the second gentleman has the bronze medal for some large heads, especially No. 109, "Perigal." Some large portraits by W. W. Winter, Nos. 104 and 105, are good; and Ralph Robinson has some of G. F. Watts, R.A., and Sir J. E. Millais, Nos. 92, 93, and 98, which are quite unconventional, and perhaps an improvement on the ordinary run.

Class V. (Architecture—Amateur) is, on the whole, a good one. C. Court Cole takes the silver medal with Nos. 223 and 225, "Oxford Interiors," of small size but exquisite detail; and Ernest Beck the bronze medal with No. 227, "Lady Chapel, York Minster," and 228 and 229, "Haddon Hall," much less elaborate subjects, but none the less effective. Other noticeable pictures are 211, "Kirkstall Abbey," by Rev. H. K. Macdona; 232, "The Reredos, Westminster Abbey," by F. Muncey; and 231, "A Drawing Room Interior," by Rev. H. B. Hare.

Class VI. (Architecture—Professional) is but a small class with only 6 exhibitors. J. P. Gibson takes silver medal with 194, "Interior of Hexham Abbey Church," of which he has several others, all first class; and H. W. Reeves the silver medal with "Drawing Room" interior.

Class VII. (Enlargements—Amateur) is also a good class with 11 exhibitors. Many of the exhibits have the small print attached, which certainly assists one to judge of the technical qualities of the enlargement, but this does not seem to be a rule.

The silver medal goes to W. H. Kitchin for a capital picture "On the Lynn," No. 259. T. H. Faulks' picture, No. 244, "A Pilot Race," is almost equally good, being full of spirit and pluck, and not so flat as many enlargements, and deservedly takes the bronze medal.

The Rev. J. G. Gibson, the promoter of the exhibition, is very highly commended for No. 257, "A Veteran;" and Mr. T. J. Bright sends several very good enlargements from what is evidently "snap shots," one of which, No. 273, "We're not Afraid," received commendation, though equally good, if not better, is 256, "A Water Party," a group of boys paddling in the water. Other noticeable pictures are Nos. 245, "View in Australia," by R. J. Owell; 262, "Tintern Abbey," by T. H. Faulks; and 263, "The Village Smithy," by W. H. Kitchin.

Class VIII. (Enlargements—Professional).—No. 208, "The Morning Mist," by M. Auty, which receives the silver medal, is a very fine picture, the delicate haze being beautifully represented; so also is 203, "Cloud Effect," by C. James, which deserved notice. The bronze medal is awarded to F. Whaley, for "Sunset on the Don"; 209b, which is rather too "naturalistic" for our tastes, the trees having suffered very much in focus.

Class IX. (Instantaneous—Amateur).—Rev. J. George Gibson receives silver medal for No. 380, "Scene in Camp," and Ernest Beck an extra silver medal for "Wind against Tide" and "Fishing Cobble," Nos. 383 and 384. A. R. Dresser's "Dog Studies," with a hand-camera, Nos. 377 and 378, are many of them good.

Class X. (Instantaneous—Professional).—Only 4 exhibitors. "The Penny Ferry, North Shields," which gains the silver medal, by Loyd Sawyer, is a capital picture; No. 330, "H.I.M.S. Victoria," firing 100-ton gun, is one of a series by J. E. Goold, showing good instantaneous effects, and receives the bronze medal. The pictures of "Henley Regatta," by Johnson Bros., are also good.

Class XI. is for beginners who have commenced photography since January, 1889. Only two competitors, and R. B. Lodge gets the bronze medal for a very creditable picture, "Pheasant Shooting."

Classes XII. and XIII. are Lantern Slides.

Class XIV. is for the best picture taken on one of Fry's plates. This being a trade prize did not attract many competitors, and was awarded to Mr. F. Whaley for No. 706, "Sunset." There is nothing very noticeable in this class, except that an extra bronze medal seems to have been awarded to one of the judges, which is surely unusual.

Class XV. (Mechanical).—These subjects do not usually excite much interest, but Royton being a cotton manufacturing centre, they may no doubt appeal more strongly to its inhabitants than to artists generally. There are a considerable number of frames by a small number of competitors containing photographs of complicated machinery, generally very well done, as such subjects usually come out well. Mr. Thomas Scottton takes the silver medal for an "Interior of Millwright's Shop," and Mr. W. Parry the bronze medal for "Horizontal Marine Engine."

Class XVI. (Scientific) may also be despatched in a few words. The term is somewhat elastic, but the exhibits are, as might be expected, mostly photo-micrographs. Mr. A. A. Carrell obtains the silver medal, and Mr. S. F. Clarke the bronze medal, for some very good work, amongst which may be noted *Pleurosigma angulatum* $\times$ 4,000 by the former gentleman. Tongue and lancets of drone fly, by E. T. Shelton, No. 397, is also good. The class includes also three specimens of photo-etching by W. L. Colls, as examples of scientific work, which have not attracted the notice of the judges, showing, we think, the desirability of more exact definition of what is meant to be included in such classes as this.

Class XVII. (Landscape with Figures—Amateur). This is a specially interesting class, as the medals were presented by ourselves, and includes some capital work. No. 319, "Mud Pies," by J. E. Austin, which gained the Silver Medal, is a very fine piece of work, the unstudied attitude of the two little urchins being highly commendable. No. 314, "Watching for Trout," by same gentleman, is equally good. Mr. T. J. Bright obtains the Bronze Medal for an enlargement, No. 324, "Three Little Maids from School." No. 318, "The Shrimper," by C. Smerdon Roe, is worthy of its Certificate; and we must also commend very highly No. 310, "A Lost Stitch," and No. 311, "A Select Audience," by the same gentleman. No. 316, "Grandfather's Pet," by Archd. Watson, is also a very pleasing picture.

Class XVIII. (Genre, the subject selected being "The Happiest Land," from Longfellow).—The prize in this (a silver medal), was offered by our contemporary *Photography*; it only, however, attracted one competitor, J. Hubert, to whom the medal was duly awarded.

Class XIX. (For the Best Picture in the Exhibition, irrespective of class).—The medals were awarded as follows: silver, H. P. Robinson, for No. 183, "Gossip on the Beach;" bronze, F. M. Sutcliffe, No. 174, "Dinner Time," and commendation to C. Court Cole, No. 19, "Three Landscapes." All these pictures also obtained awards in other classes.

Class XX. (Champion—Amateur).—The picture by A. G. Tagliaferro, No. 81, "A Favourite Spring," which obtained the gold medal, is certainly a very fine one and deserves the distinction, so does 71, "Cattle Study," by J. W. Kenworthy, which was awarded a silver medal. No. 76, by C. S. Roe, "The Old Ferry," is also very good, and receives an extra bronze medal. We may also single out for commendation No. 74, "Cooling Waters," by J. E. Austin, and No. 75 "Spring Cleaning—His only Refuge," by H. H. Williams. It is, perhaps, a drawback to a "Champion" class that, attracting as it does, the very best work of exhibitors, pictures may and must remain unmedalled which are in fact superior to some which are medalled in other classes. Of course they have had their reward.

Class XXI. (Champion—Professional).—The pictures which receive the principal awards in this class have already been named in Class XIX., viz., H. P. Robinson's "Gossip on the Beach," (gold medal), and F. M. Sutcliffe's "Dinner Time," (silver medal). W. W. Winter also obtains a bronze medal for 171, "My Mammy." We also note "The Rhymester and his Victim," No. 175, by W. W. Winter, "The Old, Old Story," No. 169, by C. E. Wyrall, "Yacht Studies," by West and Son, "Water Rats," No. 170, by F. M. Sutcliffe, and many other well-known pictures, which it is always a treat to see and which would not, probably, be attracted were there no Champion class.

Amongst pictures which are unclassified, being too late or otherwise not for competition, we may name with commendation No. 450, "Reredos of St. Paul's Cathedral," by F. W. Edwards, about 24 by 18, taken direct and a capital example of platinotype. No. 455, "Your Turn Next, Sir," by F. Whaley, No. 452, "My Time is Done," Mr. and Mrs. Auckorn, No. 435, "Peeps of Holland," a set of six quarter plates in platinotype, by W. L. Colls, and No. 406, a series of "Norwegian Views," also in platinotype, by Paul Lange, one of which entitled "Sunrise," is particularly good.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3461. **Camera and Set.**—I am in want of a good cheap camera with all movements, lens, and tripod, or a set, including camera, chemicals, etc., by good maker. Can any reader of the AMATEUR PHOTOGRAPHER recommend one to me? Size of plate required is half-plate. I do not want to pay a fancy price for one; price must be very moderate. Please state price and maker's name, and oblige.—LUDER.

3462. **Copying.**—I want to copy some old and faded photographs. Can any reader of the AMATEUR PHOTOGRAPHER give me full particulars as to the process? I want to know the process from the beginning to the end. Please say what paper, etc., to use, and you will greatly oblige.—LUDER.

3463. **Enlarging Apparatus.**—Can any reader of the AMATEUR PHOTOGRAPHER give me particulars for making an enlarging lantern, as I cannot afford to buy one? Any hints as to enlarging would also be gratefully accepted by.—LUDER.

3464. **Toning.**—Respecting my query No. 3443 last week, I made up formula according to Mr. E. J. Wall's "Dictionary of Photography," to give black tone. I found that it did not give black tone, only turned my prints reddish-brown. The paper I use is ready sensitised paper.

Chloride of gold	4 grs.
Uranium nitrate	4 "
Chloride of sodium salt	60 "
Acetate of sodium	60 "
Distilled water	32 ozs.

Fixing bath.

Hyposulphite of soda	2 ozs.
Salt	1 oz.
Bicarbonate soda	1 "
Water	1 pint.

This was given by "Working B." taken from the AMATEUR PHOTOGRAPHER, May 10th, 1889, No. 240.—W. H. A.

3465. **Stereography.**—I have a pair of stereo lenses which came off a stereo slide. Could they be made into a camera for taking views, etc.? The rackwork is all complete.—F. J. T.

3466. **Dallmeyer's Rapid Landscape Lens.**—Can any of the readers of this paper give me their opinion on Dallmeyer's rapid landscape lens? Will it do as a substitute for the rapid rectilinear, or is it only made for distant landscape views?—W. F. WRATISLAW.

3467. **Hand-Camera.**—What is a useful speed for shutter of quarter-plate hand-camera? Mine is $\frac{1}{10}$ slowest to $\frac{1}{100}$ quickest (tested), and I think it too rapid for average work. I am about to make a hand-camera with dark slides, and should be glad to have an opinion about Barner's single slides for the purpose; would it be safe to draw out slide without covering with a cloth?—OLD HAND.

3468. **Photographing in Venice.**—Are there any restrictions about taking photographs in Venice, and are the people troublesome and curious when they see a camera set up? I intend taking a 7 in. and 9 in. lens for half-plate; would a longer focus lens be of any use?—O. J. S.

3469. **Place's Shutter.**—Will some one kindly inform me where I can get a Place's ebony (or ebonite) instantaneous shutter for half-plate, and about price of same?—W. L.

3470. **Bottles.**—I have several stoppered bottles that have contained solutions of nitrate of silver for years, and have a grey deposit on them. How can I thoroughly clean them?—W. H. H.

3471. **Retouching.**—What is the correct thing to use for retouching on smooth-surface bromide paper? I have no difficulty with the matt-surface paper, but cannot manage the smooth-surface paper?—S. G. S.

3472. **Cyanotype.**—In the preparation of cyanotype paper, citrate of iron and ammonium and red prussiate of potash are used in equal quantities. What would be the result if there were an excess of either? Will some one kindly tell?—INQUIRER.

3473. **Using Camera in Hand.**—I should be very grateful for any hints how to use a half-plate camera for instantaneous work suspended from my shoulders, how to overcome the focussing difficulty, etc.? My lens is a Ross 9 in. R.S. with Kershaw shutter. Please do not refer me to any back numbers, as I am living for six months in Dresden, away from all my photo books.—E. WINN.

3474. **Duty on Plates.**—Can any one tell me if there is any duty on plates coming from England into Switzerland? The dealer of Thomas's plates in Lucerne says he has to pay a third of the cost for duty; this seems enormous, and the half-plates cost 6 francs 50 centimes. An early answer would oblige. FERRIER-KERR.

3475. **Obernetter Paper.**—Would some one of the numerous readers of the AMATEUR PHOTOGRAPHER kindly tell me the best toning bath, and most reliable, for Aristotype paper (Obernetter). I have twice tried the following, and failed each time, viz.:
Ammonium sulphocyanide 1 drm.
Hypo of soda 2 grs.
Distilled water 6½ ozs.
Chloride of gold 1 gr.

I have followed the instructions to the letter. The prints appeared all right, as they became yellow, but this yellow tone did not alter after three hours' immersion. Can any one explain this?—AULD REKKIE.

3476. **Foreign Tour.**—I should be glad if any one will give me photographic information respecting the following places: Cologne, on the Rhine, by steamer to Coblenz, S. Gaar, and Mayence, Nuremberg, Munich, and the country round Ober-Ammergau. Is amateur photography permitted at all or any of the above? and where can I get a book containing English and German phrases and questions as to photography? Is photography possible from the Rhine steamers in the middle of May? and can photographs be obtained of the Passion Play at Ammergau?—FREESTER.

3477. **Cocking.**—I find great difficulty in preventing my silver prints cockling. I do not gum them in the books, but slip the corners through slits in the mount, and after a time the prints begin to cockle until in places they resemble corrugated iron. I believe that the paper I use is stamped out by a machine. Would that strain the paper and cause it to cockle?—CARTLOU.

3478. **Taylor's Detective Lens.**—Would any reader who has taken any negatives with the full aperture (f/5.6) of Taylor's No. 3.5 in. "D" lens be so kind as to let me examine the definition of prints made from them? I will take every care of them, pay expenses, and return them promptly.—SAUMUR (address with Editors).

3479. **Hydroquinone for Lantern Slides.**—Will any reader kindly state what constitutes the best hydroquinone developer for lantern slides?—A. E. G.

3480. **Toning Formula.**—What is the best toning formula, so as to get the blue-black or blue-grey tone that is so much admired?—A. E. G.

3481. **Willessden Paper.**—Could any one kindly tell me where I can get Willessden paper in Edinburgh, and also price of same? If it cannot be had in Edinburgh, where can it be got?—F. G.

3482. **Amateur, What may he Do.**—As so many prizes are offered by photographic societies "for amateurs only," could you or one of your many correspondents kindly tell me (1) the exact difference between an amateur and a professional photographer, (2) Does an amateur disqualify himself for competing in amateur competitions by taking money sufficient only to cover expenses for photographs of friends, (3) Does he disqualify himself by selling his photographs for charitable purposes?—X. Y. Z.

3483. **Lantern Slides.**—Can any one inform me how to make magic-lantern slides, or a good book on same?—R. G.

3484. **Portable Studio.**—Would any of your numerous readers kindly tell me how to make a portable studio about 12 or 15 ft. long, such as are used at fairs, kind of material to be covered in, and probable cost? Sketch would oblige.—P. R.

3485. **Enlarging by Lantern.**—Will any reader kindly tell me if it is necessary to reverse the lens of lantern to enlarge with?—PIVOT.

3486. **Lens.**—I have a half-plate and also a quarter-plate portrait lens. Would any reader advise as to which is best to use for cartes de-visite, or does it not make any difference?—PIVOT.

3487. **Exposure.**—Will some one of experience kindly inform me the relative rapidity of Wratten and Wainwright's instantaneous plates, as compared to Ilford ordinary, and oblige?—R. W.

3488. **Solutions.**—(1) Will anyone kindly give me the most reliable, exact formula from experience of a 10 per cent. solution of pyro, using distilled water? (2) Also one containing metabisulphite of potash as a preservative; and inform me which is considered the best of the two formula, from practical experi-

ence, using Ilford plates (ordinary). (3) Also 10 per cent. solutions of ammonia and bromide, and the proportions to be used for the above plates (half-plate size). (4) Also specify any text-book containing particulars concerning 10 per cent. solutions?—G. B.

3489. **Flashlight.**—Can any one recommend me a good flash-light compound for lighting with a match and not for use in a lamp. Is such a compound more brilliant than magnesium powder flashed through a spirit lamp, and is it also more dangerous, and is it quick enough to take anyone before they can move? Can anyone recommend such a compound in preference to magnesium powder flashed through a spirit lamp?—G. B.

3490. **Enamelling.**—With regard to the enamelling plates sold by Gotz, as mentioned by C. Hethon Lewis, I find I cannot obtain the high glaze I expected (I mean equal to enamel almost), although I followed the directions as set out. Perhaps some kind reader would tell me the reason, if they have met with the same thing, and suggest a remedy?—G. S. B.

3491. **"Notice to Amateurs."**—Will some reader of this paper kindly give me particulars concerning the "Notice to Amateurs," in the last issue, about reading the article on page 505, "British Journal Photographic Almanac"? Perhaps one of the lucky forty-nine would give particulars for the benefit of others.—G. B.

3492. **Test Papers.**—I should be obliged if any one would specify in what books I can find full particulars concerning test papers, as I cannot find anything about them in ordinary text-books.—G. B.

3493. **Pyrocatechin.**—Can any one give me any particulars concerning the new developer "pyrocatechin," and where it can be obtained, with price of same?—G. B.

3494. **Lancaster's Combination Lens.**—Will any one who has used it give me an opinion on Lancaster's combination lens?—T. T.

3495. **Rapid Rectigraph.**—Will someone define and distinguish the two terms rectigraph and rectilinear, or say where such definition may be found?—J. W. W.

3496. **Enamelling Prints.**—I cannot succeed in enamelling prints by optical contact with glass; no matter what care I take in cleaning the glass, placing the glass and print together under water, and squeezing, I always get the same result, a good gloss on the print, but covered with small rough spots. Would some amateur kindly help me?—H. Y.

3497. **Unmounting Prints.**—I have a number of stereoscopic views, but with nearly all of them I could not get the stereo effect, so I measured the centres of the pictures and found they were not all the same; in fact, some were $\frac{1}{8}$ of an inch out. So I wish to unmount them, and fix them to the same distance as those which do give the proper effect. Would some amateur kindly advise me as to the best way to unmount them?—H. Y.

3498. **Cloth for Shutter.**—Will some reader please tell me where I can get a piece of cloth (light-tight) same as used for blind roller shutters?—SHUTTER.

3499. **Hand Camera.**—I should be much obliged for advice re the following: What is the best and handiest hand camera, lens, etc. (adaptable for tripod), to take as travelling companion on the Continent with a view to securing the best photographs for the magic lantern? I rather prefer glass negatives, but should not object to use others if they would suit better.—E. N. P.

3500. **Postal Club.**—Will some secretary of a postal photographic club send particulars to H. J. A., who would like to join one? (Address with Editors.)

3501. **Stereoscopic Photography.**—Will some of your readers kindly give me (1) a list of shutters suitable for above, stating prices; (2) a list of books on the subject, giving price and publishers' names?—MUWA.

3502. **Aptus Universal Hand Camera.**—Will some one who has tried the above kindly give experience? Would a 6 in. Ross rapid symmetrical be a suitable lens for the 5 by 4 size?—A. J. H.

QUERIES UNANSWERED.

Jan. 3rd.—Nos. 3339, 3347, 3348.

10th.—Nos. 3353, 3354, 3356, 3359, 3364, 3367.

17th.—Nos. 3339, 3370, 3371, 3372, 3375, 3376, 3378, 3379.

24th.—Nos. 3383, 3385, 3386, 3389, 3392, 3393, 3394.

31st.—Nos. 3401, 3403, 3405, 3406, 3409, 3410, 3412, 3414.

Feb. 7th.—Nos. 3417, 3421, 3422, 3429, 3430, 3431, 3434, 3435.

14th.—Nos. 3436, 3437, 3441, 3445, 3449, 3451, 3452, 3453, 3454, 3456, 3457, 3459.

ANSWERS.

3438. **Changing Bag.**—If "W. J. W." will send me his address, I will write him, giving particulars of a simple and reliable home-made changing bag of the sort described, those sold by dealers being often needlessly expensive.—H. J. B. (address with Editors).

3438. **Changing Bag.**—If "W. J. W." will refer back to the AMATEUR PHOTOGRAPHER about three months he will find full description of the best

changing bag I have ever seen. It is by H. Yeomans, and occupies about the bottom quarter of a column, in the region of the competitive papers. I have mislaid the number, or I would have given a more direct reference.—NORTHERN.

3438. Changing Bag.—At Jonathan Fallowfield's, 35 and 56, Lower Marsh, Lambeth, S.E., or any good photographic dealer. You can make one yourself for a few shillings. Full descriptions have been given in recent numbers of this paper.—W. A. J. CROKE.

3439. Instantograph.—This lens is a very fair one for the money. You must remember when you give such low prices you cannot expect first-class articles. I should advise you to buy a better make, and a more expensive one while you are about it.—W. A. J. CROKE.

3439. Instantograph.—This camera is extremely light, portable, and at the same time a rigid camera, and is, in my opinion, undoubtedly the best of any of the cheap makes. The lens is exceedingly good as a single lens, and cannot be beaten at the price. I would forward sample of work done with above upon receipt of stamped addressed envelope (through Editors).—CLAUDIUS.

3439. Instantograph.—I bought a half-plate in 1855, a very clumsy camera as compared with their present make, with a loose base-board, but so faithfully built and of such good material that I have rarely fogged a plate, and those few plates which have been fogged I can trace, nearly all of them, to my own carelessness. As to the lens, I found such difficulty in focussing that I discarded it for a Ross R.S. 8 by 5, such a good instrument that I have not used the Instantograph lens again; but as, till I got a focussing glass, I had the same difficulty with the Ross lens, I conclude the fault was in my eyes, as a young neighbour who often borrowed my camera got perfect definition with both lenses. I am using the 1885 camera to the present day, and but for the awkward loose base-board I would not wish for a change.—NOVOCASTRIENSIS.

3439. Instantograph.—I can make no complaint of the camera. It is compact and complete, and cheap. But my individual lens had a flare spot, which was very distinct when I cussed for 75 yards. Perhaps mine was an exception.—J. W. W.

3440. Set of Apparatus.—Consult the lists of any decent maker; or, if you like to write to me, I shall be glad to advise you. Ilford plates on Thomas' extra-coated will serve you well.—W. A. J. CROKE.

3442. Spilled Negative.—If when you say the silver you mean the film, soak for a couple of minutes in boiling water, and the film will at once leave the glass.—W. A. J. CROKE.

3442. Spilled Negatives.—In each ounce of methylated alcohol dissolve 3 grs. of pure cyanide of potassium crystals. It is best to go all over the film, rubbing lightly, just bearing a little where the spots are. After all the spots or markings are removed, it is best to flood the plate with fresh methylated spirit.—J. H. M.

3442. Spilled Negative.—Try long immersion in fresh hypo bath. If this fails, well wash, then gently rub spots with a tuft of cotton-wool, moistened with a fairly strong solution of cyanide of potassium.—C. J. E.

3443. Toning.—The following borax formula will give you good tones. If you really wish a very black tone, use 2 grs. of gold instead of 1; but be careful you do not stain your prints. Stock solution: 1 oz. of the finest powdered borax dissolved in 2 quarts of water. Solution for use: Take of the above borax solution 8 ozs. to 1 gr. of gold, or, in your case, 2 grs. of gold. This will tone one sheet of paper.—W. A. J. CROKE.

3444. Japan, Plates in.—Messrs. Cocking and Co., Yokohama, keep stock of all photographic goods.—J. H.

3446. Opaline.—The best mountant is gelatine, which should be used in a rather weak solution. Place plenty on glass and print, and bring them together, and then by means of a squeegee or fingers work out all air bubbles and superficial solution from between them, commencing at centre and working towards edges. I mount mine wet and then when dry trim and fasten on back with paste or strong gum, and place under strong pressure till firm.—C. J. E.

3447. Instantograph.—All cameras now are made conical shape. They are much more compact than the square bellows, and better in every way.—W. A. J. CROKE.

3448. Merveilleux.—The rapidity of exposure depends entirely upon the relative focus and aperture of the lens, and not at all on the camera. You can, therefore, fix a rapid lens to your camera to take instantaneously.—W. H. H.

3448. Merveilleux.—Yes, it can certainly be fitted with an Instantograph lens. Only a slight alteration will be needed, if any. This you must see for yourself.—W. A. J. CROKE.

3450. Hydroquinone and Intensification.—“O. M.” will find the formula for the hydroquinone as used by me in the AMATEUR PHOTOGRAPHER of November 29th, 1889, p. 350. Of all the formulae I have tried it is by far the best. Hydrate of soda, which is recommended by the Ilford Company, has no advantages that I can discover. It is highly deliquescent, and so difficult to keep, and

inconvenient to handle. “O. M.” should mix his own solutions if he wishes to ensure their efficacy, and would probably save 500 per cent.—A. E. VENN.

3455. Hydroquinone and Intensification.—“Lola” must accept all responsibility for the term “Infallible cure.” I disclaim it. (1) I develop negatives with pyro, and lantern plates with iron or hydroquinone; but whatever may have been the original developer, my method is the same. (2) I have given the reference for this formula in reply to query 3450, but as “Lola” is presumably a lady I give quantities to save her the trouble of reference.—

Hydroquinone ...	...	...	20 grs.
Sulphite of soda ...	...	...	80 "
Carbonate of potash ...	...	...	60 "
Water ...	...	...	4 ozs.

Like “Lola,” I, too, have achieved good results with sulphite of soda, but infinitely better with ferrous oxalate, and best with hydroquinone, and with the two last there is not the risk of hopelessly reducing the image that there is with the sulphite, which is at best a treacherous medium, attacking the film savagely, and often unevenly, and a very unsafe agent with a valuable negative. I have only an elementary knowledge of chemistry, and don't deal with its alchemical abracadabra, but I take it that the mercury is the intensifier, and the other agents but darkening media. I too often find that a film will not bleach in the mercuric solution, but I proceed and achieve the same results as if it did. It would seem that bleaching is not an unfailing symptom of the intensifying action of the mercuric chloride.—A. E. VENN.

3460. Hand-Camera.—I should certainly recommend the Facile, sold by Fallowfield, of Lambeth. It is certainly cheap and reliable, at the same time being extremely simple to use, and very effective in its work.—INSTANTO.

3460. Hand Camera.—I consider Fallowfield's Facile camera by far the best, cheapest, and most effective. It takes a dozen quarter-plates, and they are changed by turning a knob at the side. There is no bother and lost time with loose backs. The lenses too are perfect. It is the most delightful camera too I know of for taking “shots in a crowd” without being noticed. Being simplicity and cheapness itself, I cannot speak too highly of it.—F. P. P.

3460. Hand Camera.—The Facile is undoubtedly the best, cheapest, and most effective hand camera in the market for taking twelve quarter-plates or films without changing. If Mr. Dundas writes to Mr. Fallowfield he will send full particulars and specimen prints taken with either the landscape or rapid rectilinear lenses.—L. H. S.

3460. Hand Camera.—Fallowfield's is the latest and best up to date. I should advise your calling in and looking at it if you are anywhere in that direction.—W. A. J. CROKE.

3460. Hand Camera.—Your correspondent cannot do better than get one of Fallowfield's Facile hand-cameras, for they are certainly the cheapest in the market and quite equal to other makes at much higher prices. There is space for a dozen quarter-plates, the lenses work splendidly and really good work can be accomplished.—G. JENKINS.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT:

REV. T. B. HARVEY BROOKS.—We should say plates.

X. Y. Z.—It is held that an amateur photographer is one that does not practice photography as a means of livelihood. We insert your query in full, as some of our readers may be disposed to give their opinions more fully.

J. M. M.—The hand-camera you contemplate is an excellent tool to work with, the lens all that can be desired, the changing back a little clumsy perhaps but certainly to be preferred to 2. But for completeness and ease of working we advise camera 3, fitted with the lens mentioned. Shall be pleased to give any further information to “A Subscriber and great admirer of the AMATEUR PHOTOGRAPHER and the Reporter.”

W. EYDMAN, JUNR.—We never name apparatus. You make a selection of three or four, and we will advise either under number or letter.

JOHN E. GREAVES.—We should recommend Nos. 2 and 3. Really cannot advise you as to shutter; write to the one or two firms who make apparatus for stereoscopic photography a specialist.

CHAS. S. TICEHURST.—Address your letter to the firm—at Dundee will find them; and Aberdeen the second firm you name.

REV. E. J. POPE.—Your query is inserted. Would it not be possible to secure a good set of photographs? Perhaps you will write us, or better still as you pass through London give us a call, but please make an appointment on a Tuesday or Thursday, most convenient.

W. K. BURTON (Tokio).—Yours is a capital letter; will write you later.

EUSTACE PINKERTON.—(1) We have used the camera. (2) We believe it to be quite possible for all objects to be in focus at or about the distance mentioned, but we cannot say from our own knowledge that such is the case with the lens you name.

MAJOR E. J. BECHER, R.A.—MS. to hand, for which many thanks.

CYRIL S. COBB.—Very kind of you to call our attention to the book. “Trubner's” have not sent a copy for review, or we should certainly have given it a notice. Have you seen AMATEUR PHOTOGRAPHER Prize Pictures, No. 1? We should value your opinion upon it. Could you spare time to call any Tuesday or Thursday after 2 o'clock.

THETA.—Will write you very shortly; should be very delighted with some of the slides; it is good of you to help us. The AMATEUR PHOTOGRAPHER lantern slides are greatly appreciated. We have a very fair list of competitors in “Lantern Slide Competition,” but have not received 2,000 slides, but then we have only one poor little gold medal, and silver and bronze medals, and no rich firm of plate makers to help us advance the “medal craze,” or rather craze for medals.

A. R. DRESSER.—You are quite right, and you may depend upon it that the creating of a prize for a sub-editor, who, doubtless at his own suggestion, assisted in judging, owing to the fact that one of the advertised judges was on his back with the epidemic, will not be overlooked by us, or our readers. But then when a sub-editor rises to the distinction of “opening an exhibition,” his services ought to be considered, though an award has to be created for him. That sub-editor must indeed feel exalted, for never before in our experience has the purple fallen upon the shoulders of even an editor of a photographic journal. On the other hand, local interest must have been at a low ebb to necessitate that a stranger, and only a sub-editor, should have to be called upon to perform the ceremony. If it had been known that such an honour was to be thrust upon the “Fourth Estate,” doubtless there would have been a galaxy of editors of photographic journals ready and willing to combat for the right to “say a few words upon this auspicious occasion.”

J. B.—It is very easy to avoid the mistake of exposing the wrong side of bromide paper. If your sense of touch is not delicate enough to detect the right side from the wrong, place the sheet on the warm hand, and it will presently curl. The concave side will be the sensitive one.

PINESTAS.—A and F are the best, and are about equal in performance. (2) Immaterial, if you have an honest man to deal with.

PRINTS.—Consult a text-book on photography. Time, about fifteen minutes.

CURIOS.—All the goods made by the firm named are reliable, but we are not acquainted with the working of the special apparatus named.

W. S. M.—We prefer B and C on your list. The great advantage of getting goods with a first-class name is that their value remains, and but little is lost by their re-sale.

W. C. B.—Your question refers to a strictly professional matter, and cannot come within our ken. How can you expect us to regard you as an amateur photographer when you are seeking an appointment as assistant operator? We return your prints by post.

VERITAS.—The original can be done on ordinary paper, but specially prepared (clayed) card is better for the purpose. It is handed to the photographer for reduction. The process could be modified by being executed, as you suggest, in transfer ink, but the result would not be so delicate. There is no distortion involved in the reduction process. All the line drawings which appear in the AMATEUR PHOTOGRAPHER are executed by the process described. You should procure the book upon the subject written by Wilkinson.

NAIRN.—The fault is due to unequal coating, or to leaving part of the plate exposed to the air during the fixing operation.

ANS.—While you are purchasing the lens (No. 4 on your list) you would do well to get a camera of the same makers, and a stand too while you are about it. It is a mistake to get every item from a different maker, and the course as indicated by you would certainly involve you in extra expenses.

W. H. B.—We should prefer No. 2 on your list.

FRANK.—We cannot account for your failure, and should advise you to give portions of one plate different exposures by partially withdrawing the slide of the double back. Hydroquinone may develop chloride lantern plates with a green tone. Sodium sulphite helps to keep the developing solution clear. We prefer not to use it with hydroquinone, but to use caustic potash as the alkali. Always mix fresh developer after developing four or five plates.

A. H. S.—You cannot do better than C. We are, however, surprised to learn of your failure with the lens which you have, and should advise you to send it back to the makers, who would certainly exchange it for another if your complaints are well founded.

CARRIG.—The lantern slides sent are lacking in vigour, and for this reason would not look well when

projected by the lantern. The slides should be furnished with cut-out paper mounts, to separate the cover-glass from the photograph. You would do well to study "The Book of the Lantern," to be obtained of our publishers. We return slides by post.

G. B.—The price of the "Home Portraiture" Special Number will be 1s. The advertisement pages are numbered in small Roman figures.

Miss B.—Your negative is hopelessly under-exposed, and therefore useless. The developer which does not stain the hands is ferrous oxalate, but it does not give such latitude in use as pyro.

L. S.—You are sure to find 1 a good lens. The 5 by 4 you mention as working with shutter is by a good maker; both are reliable. We think highly of the shutter. We know nothing of the combined toning and fixing bath you mention, and should not recommend you to use any combined bath. If this reply is not sufficiently clear, write us again and we will reply by letter.

G.—The portrait you send is most creditable; we fear, perhaps, your negative may be rather fogged. The face is hardly sharp enough to please us; perhaps the negative will stand printing out a little more. Cannot recommend you to employ a professional retoucher, as in all probability he will "improve" it beyond recognition. Print returned. Shall be very pleased to see more of your work.

T. STANWAY.—Had written the par, but held subject to receipt of letter from you.

L. W. D. MAIR, M.B.—Sorry that the reply was unintelligible. A is perhaps the most practical. The others are much more expensive, but of them we should favour B. For the purpose you mention we think you would have no difficulty in using A.

Monthly Competition.

We have received prints from the following:—

Title of Print.	Name of Sender.
Church Avenue, Careston	W. O. Adamson
Arundel Lake	A. R. Dresser
Bynsford, Kent	J. K. Taylor
Farnon on the Dee	W. H. Scott
On the Gavy, Devon	E. P. Vulliamy
The Wye, Glasbury	E. J. Jackson
View in Surrey	E. Enoch
Glenariff, co. Kerry	W. H. Smedley
A Glade in the New Forest	J. G. Jones
Miller Bridge, Ambleside	J. R. Roddick
In the Garden, Hill Foot	J. L. Snelgrove
An Autumn Evening	F. S. James
The End of a South Devon Lane	G. K. Trench
Moonlight off Westward Ho!	G. T. Bruce
A "Bit" in Battersea Park	G. T. Zimmer
Betchworth Mill	F. Dowsett
Scarborough Harbour	C. E. Cowper
Ford End, near Chelmsford	G. B. Bisat
A Northumberland Lane	T. Howlett
View on the Don, Sprotbrough, Doncaster	G. Smith
Wood Waggoners	J. J. Rix
The Cherwell Mesopotamia, Oxford	J. Tims
Where Three Counties Meet, Haslemere	J. Harriman
Roxley Bridge, Chessington, Surrey	Miss B. L. Slight
Henley-on-Thames in Time of a Flood	H. Tonkin
A Moonlit Sea	W. J. Battell
Newlyn	Miss E. Portal
Within Sound of the Sea	J. T. Belding
The North Tyne	E. B. Wain
Belagha on the Bure, Norfolk	G. Tucker
At Conway	H. Edwards
Mansbridge, near Southampton	T. B. Judson
Swanbourne Lake, Arundel Park, Sussex	C. C. Cole
Shipley Glen	F. G. Smart
Evening: Is Father Coming?	T. W. Millburn
The Harbour, St. Ives, Cornwall	P. E. Lyne
Valley with Running Water	W. T. Wright
At Belton	D. D. Munro
Bound for the Isle of Man	F. S. Taylor
A Highland Corrie	A. H. Moore
The Avon	F. C. Peters
Henley-on-Thames	G. H. Brown
The Stroud Canal at Ealingdon	W. H. Armitage
Ruins of Sherborne Castle, Dorset	A. E. Methold
Lough Derg	W. Frew, F.C.S.
Northbourne Brooks	H. Brown
Ochterlyne House and Loch, Perthshire	W. A. J. Croke
Hoar Frost	H. J. Reeves
Arundel, Sussex	
The Decayed Barn	

The Gairn Ferry	D. Wardrop
Entering Lowestoft Harbour in a Calm	A. M. Smith
An Old Roman Castle	R. Maclean
View in Terrace Gardens, Richmond	A. C. Hunter
The Thames, Richmond	E. H. Jeffrey
A Woodland Scene, Leigh Woods, Clifton, Bristol	A. F. Kerry, B.A.
View in Hawarden Park	J. L. Mackrell
View from Templeport Rectory, co. Cavan	Rev. J. Rawlins
Llanberis, Mid-Winter	Miss Hands

Lantern Slide Competition.

In the above Competition we have received lantern slides from the following ladies and gentlemen:—

A. H. Webling	Hove, Brighton
F. W. Stow	Bedale, Yorkshire
A. F. Kerry, B.A.	Oxford
S. Francis Clarke	Louth Lincolnshire
W. J. Farthing	Bowden
K. L. Reynolds	London, N.W.
H. W. Bloomfield	Norwood, Surrey
W. T. Wright	Bootle, Liverpool
A. R. Dresser	Bexley, Kent
H. H. Hammond	Southsea
H. Day, M.D.	Southbridge, Kent
E. Beck	Sheffield
R. Atkins, M.D.	Waterford
D. Wardrop	Portsmouth
W. Frew	Dundee
J. A. Sinclair	Bootle, Liverpool
F. Howlett	Westbourne Park
A. O. Pemberton	Neasdon, N.W.
F. C. Kellow	South Hampstead
J. E. Kellow	South Hampstead
J. C. Austin	Maidstone
G. Bingley	Leeds
W. H. Bailey	Cookham, Berks
F. W. Muncey	Kilburn
J. Shakespeare	Derbyshire
R. Leventhorpe	Gosport
A. Brooker	Hastings
J. Carpenter	Clapton
A. Watson	Glasgow
T. W. Derrington	Wolverhampton
H. K. Bridger	London
A. H. Short	Acton
F. J. T. Walford	London
E. M. Turnstall	Liverpool
H. Shimwell	Birmingham
A. Cornell	Tonbridge
W. Milburn	Sunderland
J. Minn	Oxford
C. A. Brightman	Bristol
J. H. Avery	London
W. E. Galloway	Gateshead-on-Tyne
A. Pinheiro	Cardiff
J. C. H. Smith	Earl's Court
F. G. Pierpoint	Leicester
E. W. Smith	Bromley, Kent
R. C. Macleod	Maywards Heath
H. L. Bridger	Hampton, Mid.
E. G. Lee	Birmingham
W. Walker	London, N.
J. O. Arnold	Sheffield
W. L. Fletcher	Workington, Cumberland
E. Deacon	Ramsgate
D. G. Gordon	Anerley, S.E.
P. J. Cooper	Darlington
C. B. Palmer	Dulwich, S.E.
G. Kilburn	Dewsbury
R. J. Orrell	Blackburn
J. W. Wade	Manchester
H. Little	East Twickenham

Prize Tour Competition.

In the above competition we have received the following entries:—

W. McLean Forbes	New South Wales
Miss Griffith	Littlethorpe
W. W. Whittard	Cheltenham
R. J. Shields	Mexboro
W. L. Howe	Beccles
W. B. Windeles	Long Ditton
Mrs. Co'e	Lewes
J. T. Black	Corstorphine
F. Anyon	Liverpool
A. G. E. Newland	Upper Burmah
L. W. Tindal	Newton Abbott
Lumley Cator	London
Capt. Brotherton	Calleroats
R. Tindall	Leighton Buzzard
G. E. Galbraith	Stirling

Sale and Exchange.

RULES.—Forpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," vols. ii. to ix., complete including Specials, bound in cloth; also loose numbers of vol. x.—Offers to Sinclair, Herald Office, Glasgow.

AMATEUR PHOTOGRAPHER, 1888, 1889, six missing; what offers?—Tewkesbury, York Road, Eastbourne.

Apparatus.—10 by 8 Steinheil photographic lens, cost 55 dol., in Philadelphia, £14 10s.; half-plate (Horne and Thornthwaite, London) portrait lens, £2 10s.; 10 by 8 portable mahogany camera, with carriers, complete, £2 10s.; half-plate portable folding camera, with Lancaster's instantaneous shutter and ash stand, £2 5s.; quarter-plate lens, £1; money tester, for gold or silver, 5s.; 12-pill machine, 7s. 6d.—Apply to Mr. Robinson, 32, St. James's Road, Hastings.

Four porcelain dishes, 12 by 10 to 15 by 12, 7s. 6d. the lot. Four whole-plate and two 10 by 8 printing frames, 7s. 6d. Two quarter and two half grooved plate boxes, each holds 50, 7s. 6d. the lot.—T. Hall, 110, Ulleswater Road, Lancaster.

Backgrounds.—Charming scenic backgrounds, 25s.; or exchange half-plate set.—2, Peter's Street, Dereham Road, Norwich.

Background and Burnisher.—Pretty landscape background, 7 ft. 6 in. by 6 ft. 6 in., on linen, 18s.; also whole-plate burnisher, with atmospheric burner, 20s.—3, Bellevue Terrace, Southsea.

Bicycle.—Exchange 52 in. No. 1 Rudge bicycle, ball bearings throughout, with K.R. lamp, for photographic outfit, including half-plate double-extension conical leather bellows camera, with R.R. lens.—Apply, A. C. Beilby, Roundhay Park, Roundhay, Leeds.

1890 Diamond Safety bicycle; list £15 15s.; with extras, £7 7s.—2, Peter's Street, Dereham Road, Norwich.

Cameras.—For sale, a Luzo hand-camera, to take 100 negatives, new; price £3 3s.—G. Tatham, East Molesey Park, Surrey.

Whole-plate camera, strong, all movements, four Blair's feather-weight slides, also adapter for 12 by 9 and three slides; cash 90s.—Jenkins, Fern Bank, Gloucester.

Rough's patent camera, half-plate, three double dark-slides, and canvas case to contain the lot, camera has double swing and reversing back, perfect condition; price £4 lowest.—Sydney Miller, 23, Highbury Grove, Islington, London.

Camera and Lens.—7½ by 5 reversible mahogany bellows-body camera and double slide with R.R. lens, all equal to new; £3; approval; deposit.—Sunderland, Smethwick.

Camera, Shutter, etc.—5 by 4 camera (by Meagher), three double slides, leather case, time shutter (by Moore), and brass tripod; £3.—Calam, 18, Park Lane, Leeds.

Cripper.—A Cripper, by Marriott and Cooper, geared 60 ins.; £10.—G. D., 6, Richmond Villas, Middle Lane, Hornsey.

Hand Camera.—First-class hand-camera, with Ray's 5 by 4 lens, new last spring; £7 7s.—Can be seen at J. Swift and Sons, 81, Tottenham Court Road, W.

Lantern.—Optimus lantern, 35s., cost 45s.; Taylor's half-plate lens, 17s. 6d.—No. 6226, at Goy's, 54, Lime Street.

Lenses.—A good half-plate lens and stops; 30s.; open to offer.—B. Lillywhite, 21, Mare St., Hackney, London, N.E.

7 by 5 Burscough lens (Perken and Rayment's), working f/6, new last December; cash £3 15s. 6d.—T. A. Blake, 99, Edinburgh Road, Liverpool.

Half-plate Lancaster's instantaneous lens, with Iris diaphragm and patent shutter, new last year, 20s., bargain; doublet lens, quarter-plate, 5s.—Wm. Trench, Church Street, Kidderminster.

R.R. lens (by Wray), back focus 8 ins., equivalent focus 8½ ins., full aperture f/8; U.S. No. 4, to cover 8½ by 5, only used a few times, also Kershaw shutter to fit the above, new; £3 5s.—E., Heath, Leighton Buzzard.

Lens and Tripod.—For sale, half-plate lens (by

Lancaster), metal instantaneous shutter, tripod in leather case, and tripod top; the lot £1.—Atkinson, 20, Linden Road, Dewsbury Road, Leeds.

Negatives.—Foreign views, and sets of lantern negatives, 4s. per dozen; sample 7d.—41, Trafalgar Road, Old Kent Road.

Sets.—Lancaster's 1889 half-plate Instantograph camera, double slide, tripod, and rapid rectilinear lens, *f*/8, with set of Waterhouse stops, quite new; bargain, 72s. 6d.—John Slade, Slad Road, Stroud, Glos.

Half-plate camera, two double dark-slides, and tripod, cheap.—Jones, Enfield House, Uffculme, Devon.

An 8 by 5 American landscape camera, has swing-back, rising front, etc., takes pictures either horizontal or vertical, three double slides, solid leather case, portable tripod stand, and either a Ross' symmetrical lens or a rapid Euryscope, working at *f*/6, all in fine order; a bargain, £7 10s.—H. Taggart, jun., Tontine House, Glasgow.

Camera, Lancaster's half-plate Instantograph 1889, guaranteed very finest order, all latest movements and improvements, leather bellows, long extension, reversing back, rapid rectilinear lens, Waterhouse stops, moveable hood, slide, carrier, and folding tripod; £3 15s.; approval.—C. Carlous, 74, Hercules Buildings, Westminster Bridge Road.

Hand-camera, quarter-plate, fitted with Optimus R.R. lens, Newman's shutter, six double slides, two finders, etc.; £5 5s.—H. S., 75, Loampit Vale, Lewisham, S.E.

Lancaster's 1886 Instantograph camera, 2 double dark-slides, and tripod stand, in case, complete, 40s.; also eight vols. AMATEUR PHOTOGRAPHER, bound; what offers?—Photo, 8, Cooham Street, Gravesend.

Sands and Hunter's Exhibition camera, three slides for 5 by 4 and quarter-plate, and case, 60s.; Watson's four-fold tripod, 15s.; Wray's R.R. lens, Iris, new and perfect, 52s. 6d.—Bell, 4, Milton Terrace, Belfast.

Whole-plate long-focus camera, swing and reversing back, three double slides, £3 7s. 6d.; double-blind shutter, 2 in. aperture, 7s. 6d.—G. Constable, Market Street, Lewes.

Quarter-plate box camera and good portrait lens (by Murrell), with dark-slide, complete; 7s. 6d.—Spiller, Hillside, Hampstead Hill Gardens, N.W.

Instantograph, latest pattern, whole-plate camera, lens, instantaneous shutter, dark-slide, and tripod, good condition, only £4 10s.; new solid leather look-up case, cost 35s., price 18s.—J. W. C., 152, Southampton Row, W.C.

Smith's Simplissimus camera, half-plate, and three double slides, Optimus rectilinear lens, 7 by 5, and three-fold stand, all perfect; price £5 5s.—T. Hall, Ulleswater Road, Lancaster.

Lancaster's Instantograph quarter-plate camera, latest improvements, three double dark-slides, tripod, Ross R.R. lens, instantaneous shutter, and all appertaining to dark-room, viz., printing frames, developing and toning dishes, chemicals, scales, plates, negatives of Scarborough, etc., etc.; the lot £5; owner giving up photography.—A. H. Goldsmith, 29, Marine Parade, Worthing.

Quarter-plate London Stereoscopic Company's camera, lens, two double dark-slides, folding tripod, and case; price 30s.—A. Goswell, Wokingham, Berks.

Lancaster's half-plate Instantograph, 1887 pattern, rack lens, shutter, wide-angle lens, three double slides with tins, carrier, two-fold stand, and leather case, with straps, pads, and focussing cloth; 75s.;

approval.—R. Edwards, 140, York Street, Hulme, Manchester.

Lancaster's International half camera, lens, three dark-slides, leather case; cost £7 10s.; will take £5 10s., or offers.—J. H. L., 17, Holmedale Terrace, Harrogate.

Lancaster's quarter-plate International camera, rapid rectilinear lens, with Waterhouse stops, instantaneous shutter, folding tripod, two double dark-slides, waterproof case, washing rack and tank, etc., nearly new, genuine set; price £3 10s. Wanted, half-plate.—Swain, 28, New King Street, Bath.

Slides, etc.—Six Turnbull's film slides, very compact, equal new, cost 35s., accept 22s. 6d.; six half-plate ditto, cost 54s., accept 37s. 6d.; Pumphrey's telescopic stand, whole-plate, folds 12 ins., very rigid, 15s.; quarter-plate camera, four double slides, stand, rectilinear lens and case, 37s. 6d.—P., 82, Preston Road, Blackburn.

Tripod.—Tripod, rigid, light; exchange for half-plate rectilinear lens, about 8 in. focus.—Beckett, 6, The Grove, Hackney.

WANTED.

Backgrounds.—Interior and exterior background, cheap for cash.—Jones, Enfield House, Uffculme, Devon.

Cameras.—Whole-plate or half-plate Instantograph, 1889 pattern.—Fox, The College, Dover.

Lancaster's Mulum-in-Parvo enlarging camera.—Edwyn Tart, Marden Vicarage, Hereford.

Set.—Best light long-extension half-plate camera, with turn-table preferred, and three slides; state weight of camera, and particulars.—Bell, 4, Milton Terrace, Belfast.

Stereo Views.—Stereoscopic views, British and foreign.—Neill, 8, Chelsea Road, Walton, Liverpool.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.
Three Prizes of 0 10 6 each.
And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the AMATEUR PHOTOGRAPHER; and others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his personal experiences. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

	Subjects.
28th February	Apparatus.
28th March	Optics.
28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: Their Development and After Treatment.
28th July	Printing, Toning, Mounting, and Finishing.
28th August	Artistic Effect and Composition.
28th September	Outdoor Instantaneous and General Photography.

All MSS. to be addressed to the Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London E.C.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the AMATEUR PHOTOGRAPHER have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

First Prize Silver Medal and £1 1s. 0d.
Second Prize Bronze Medal and 10s. 6d.

Photographs must be sent in on or before Monday, the 10th of March. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the AMATEUR PHOTOGRAPHER, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition," The Editors, Amateur Photographer, 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the AMATEUR PHOTOGRAPHER will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	Feb. 14 ... June 14.
LANDSCAPE WITH FIGURE	Mar. 14 ... July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	May 14 ... Sept. 14.

Only one print is to be sent in; the negative of the prize pictures shall be at the service of the Proprietors, and all the prints sent in shall become the property of the Proprietors.

In addition to the Medals being given, the prize photographs will be reproduced in the AMATEUR PHOTOGRAPHER.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the AMATEUR PHOTOGRAPHER.

Competitive prints are available for exhibition before Photographic Societies after the 1st of each month.

The prints will all be numbered, and when sent to societies, will be accompanied by a book for criticism. It is hoped that the President or other official will give a note stating the general opinion of the members of the Society.

Entry forms on receipt of stamped addressed envelope.

✻ OUR VIEWS. ✻

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

WE have much pleasure in announcing that the following awards have been made by the Judges who kindly undertook the very arduous task of judging the slides entered for the AMATEUR PHOTOGRAPHER Lantern Slide Competition:—

AWARD.

AMATEUR PHOTOGRAPHER Gold Medal (for the four most artistic pictures):—

J. E. AUSTIN (Maidstone).

Class I.—Gelatine Process.

First Prize—A. R. DRESSER (Seascapes).

Second „ H. L. REYNOLDS (Animals).

Third „ GODFREY BINGLEY (Landscape).

Class II.—Collodion Process.

* First Prize—Withheld.

Second „ H. LITTLE (Animals).

Third „ F. MACKENZIE (Landscape).

We, the undersigned, having satisfied ourselves that the conditions have been complied with, except as noted, declare the prizes to have been duly awarded by us.

Signed { J. GALE, F.R.I.B.A.
CHAS. HUSSEY.
LYONEL CLARK, C.E.

Feb. 21st, 1890.

The whole of the slides were examined by transmitted light, and by far the greater number of them, so high is the standard of excellence, passed through the lantern. We would add that the work done by the Judges was of a very heavy character, necessitating their very close attention and attendance at our offices for upwards of eight hours, with only a very brief interval. We cannot in this issue comment upon the slides, but shall hope to do so at an early date. They are of a far higher quality than those received last year, and the exhibition of those selected, at the Crystal Palace on the 14th and 15th prox., will be a rich treat for all interested in lantern slides.

* In this case a competitor, who in the opinion of the Judges ranked first, had entered slides for this class, which upon examination proved to have been made by gelatine process. Consequently the prize was withheld.

LAST evening (Thursday), arrangements were made to hold a meeting at Exeter, in order to form a photographic society for that city. We shall doubtless receive a report, which will be published in our next issue.

* * * *

WE are asked to notify that in connection with an Industrial and Art Exhibition to be opened on the 9th of April, at Alton, there will be a class for photographs, having two divisions: (1) Landscape, (2) Studio subjects. Further particulars may be had from the Secretaries, Miss Pechell and Miss Burnet, Alton, Hants.

* * * *

WE have received the following notice from the Secretary of the Camera Club in regard to the arrangements already made for the 1890 Conference:—

The Conference, as already announced, will take place at the Society of Arts, on Thursday and Friday, March 20th and 21st, under the presidency of Capt. Abney.

Amongst the papers to be read and discussed will be the following:—

"The Art of Drawing and Photography," by Mr. A. M. Rossi.

"Photography by the Light of the Electric Spark," by Lord Rayleigh.

"The Latent Image," by Mr. C. H. Bothamley.

"Limitations in the Treatment of Subjects by Focus," by Mr. T. R. Dallmeyer.

"Collotype and Photo-Etching," with practical illustrations, by Mr. W. T. Wilkinson; and other papers, by the President, Mr. Lyonel Clarke, and others.

It is further proposed to bring forward in as complete a manner as possible the subject of photographic exhibitions and their regulations.

The exhibition of apparatus will be as usual in the Library of the Society of Arts.

All photographers or others interested in the subjects under discussion are invited to be present.

* * * *

IT is our practice now to refrain from any criticism or comments upon the working of the Camera Club, which is, of course, a private concern, but we understand that very active steps are being taken to provide new premises, that the number of members has increased considerably, that the

finances of the Club are in a very healthy state, there being a considerable invested fund, and that the Directors were able to recommend at the last meeting the payment of a dividend at the rate of 5 per cent. per annum upon the capital of the Camera Club Company, Limited.

* * * *

THE Liverpool Amateur Photographic Association are having a busy season. The exhibition of Mr. H. P. Robinson's photographs closes to-day. Over 1,200 visitors have derived pleasure and instruction from the inspection of the photographs which have won such golden opinions all over the world. During March we understand that Mr. Harry Tolley's photographs will be on show in the rooms of the Association.

* * * *

WE are delighted to hear that arrangements are in active preparation for placing before the public the particulars of the second Liverpool Photographic Exhibition. This exhibition will be on a much more extensive scale than the one held in 1887, which, as is well known, we always consider to have been the premier photographic exhibition. In a week or two we shall have more definite information to put before our readers. The Association will be fortunate if they again secure the courteous and energetic services of Mr. Thos. Mayne as Honorary Secretary.

* * * *

Last week the Council of the Photographic Convention of the United Kingdom held their first meeting this year. We understand that all matters appertaining to last year's meeting have been cleared up, and that, notwithstanding the enormous expenses attending the holding of the meeting in London, the guarantors were only called upon for a few pounds. This year's meeting, which will be held at Chester, under the presidency of Mr. C. H. Bothamley, F.I.C., F.C.S., will open on the 23rd of June, and continue up to and inclusive of the 28th of June. A *conversazione* will be held on the evening of the 23rd, when the President will deliver his address, followed by an exhibition of lantern slides. Excursions will be arranged to Moreton Old Hall, Conway, Bettws-y-Coed, Carnarvon, Hawarden, Llangollen, etc., and a trip up the Mersey to witness the regatta. Papers will be read and discussed every evening. There will be an exhibition of apparatus, etc., and there will be *no charge for space*. The annual dinner will take place on the evening of the 27th. The local committee is a strong one, and there is every reason to anticipate a well-attended and successful meeting.

* * * *

WE are very anxious to have a good competition for the prizes offered for photographs of the Forth Bridge, and would remind our subscribers, especially those "north of the Border" that all competing prints must be sent us not later than the 10th of March.

* * * *

ALL photographs for the Prize Tour Competition, framed or unframed, must be in our hands to-morrow (Saturday).

* * * *

It is proposed to form a photographic club in connection with the Central Y.M.C.A., Exeter Hall. The club, we understand, will be under competent direction. Ample space in the basement of the building will be devoted to

dark-rooms, etc., which will be available at all hours in the day. Applications for membership to be addressed to the Secretary, Y.M.C.A., at Exeter Hall.

* * * *

THE Photographic Society of Japan is fast becoming a very active centre for celestial and other photographers. The following resolution has been passed:—"That this Society discountenance, by all means in its power, the practice of copying the photographs of other artists for sale, and that, if the practice be continued, the Society take into consideration the desirability of making a by-law whereby such practice shall *ipso facto* exclude from membership of the Society."

At the same meeting a member exhibited a camera to take direct photographs 38 by 30 ins. A printing frame has also been made for printing on paper, measuring 4 ft. 6 ins. by 3 ft. 6 ins. Several other items of news show the Society to be fully alive to the advances being made in photography. Mr. W. K. Burton is a very active member, and gave his experience of "Eikonogen" as a developer at the last meeting.

* * * *

BEGINNERS' DIFFICULTIES.

MANY are the inquiries which reach us from aspirants to photographic fame with reference to remedies to heal their faulty negatives. It would almost seem that the text-books were to them sealed volumes, for the greater proportion of the difficulties which they tell us they have met with have been again and again descanted upon by those writers who have devoted their attention to photographic literature. Every possible fault has been dealt with in detail, and the possible pitfalls have often been pointed out, so that he who runs may read. But it is, unfortunately, the case that, with the majority, running is a far more congenial occupation than reading, and this is true, not only of amateur photographers, but of the public at large. It is certain that there is a large class of persons who never even read a newspaper, for upon no other hypothesis can we account for the behaviour of those curiously constituted minds which are still taken in with the "confidence trick," and other well-known nets which are daily spread to entrap the foolish.

The beginner in photographic operations can hardly be expected to know all that has been written for his benefit, for the bibliography of the art is now very extensive; but he should at least make himself master of one text-book, so that he need not be quite at sea when his first difficulty arises. We are disposed to think that he is troubled rather with a plethora of formulæ than a want of any, and that his difficulty lies in picking out one which will best serve his purpose for the time being.

The first problem which he is called upon to solve is the correct exposure for subjects which greatly vary in the amount of illumination which they possess. Cunningly devised tables help him but little, and necessitate calculations which are apt to draw his attention away from other important details. Experience is a far better teacher, and with practice the earnest worker gradually learns how to estimate the exposure of the plate by the appearance of the image upon the ground-glass focussing screen of the camera. This power cannot be gained without observation and practice, but when the knowledge has once been acquired, the operator will seldom make an error in his exposure.

Over-exposure is a far more common error than insuffi-

cient exposure; and it is fortunate that this is the case, for it can be remedied either during or after development. Under-exposure, on the other hand, cannot be compensated for, and when this fault is apparent in a negative, we need never hope to gain a decent print from it. If over-exposure is indicated by the image developing quickly all over the plate, a ten per cent. solution of sodic citrate swilled over the film, the developing solution having been quickly poured off first, will at once check the action, and development can be recommenced with caution. A plate so checked and redeveloped will often yield an excellent negative. If, however, the developing action be allowed to go on, a very thin negative, but one which is generally full of detail, is the result, and our only hope under such circumstances will rest upon some method of intensification.

In such a difficulty the beginner turns to his collection of published formulæ, and finds such a number of recipes which are warranted to cure the evil, that he feels somewhat like the man with a cold, who is told what to do for it by anxious friends, all suggesting something, but no two agreeing in what that particular something should be. The mercury method seems to him to be perhaps the easiest, but unless the film be very thin, that method of treatment will often discolour the image to such an extent that it is no longer printable. This discolouration is more common after pyro development than after iron development, but this intensifier is at the best uncertain. We would advise the beginner to try another method which is more effective, and which generally works well with all plates. We allude to the uranium method, a brief description of which is as follows: After the plate is fixed, wash it well, and place it for two or three minutes in a solution of uranium nitrate, ten grains to the ounce of water. After draining the plate, but without washing it, immerse in a solution of potassium ferricyanide of the same strength. In this latter solution the image will quickly change colour, and it should be lifted out of the liquid once or twice in order that this change may be seen, and not allowed to go too far. A very thorough washing must follow, and after drying the film, it should be varnished.

Another common fault which the early negatives of an amateur are apt to exhibit is undue density, due, not to over or under exposure, but to over-development. The best reducer for this state of things is that originally published by Farmer, in which potassium ferricyanide is once more the useful agent. The chief difficulty in using this formula is in its very energetic action, and it may be guarded against by using very weak solutions of both the potassium salt, and of the hypo which is employed with it. The negative may be transferred from one solution to the other until the right amount of reduction has been attained, when the plate must be immediately placed under the tap to receive a thorough washing. This reducer is also most valuable in other ways. For instance, a lantern-slide with a dirty sky—and with what dirty skies some amateurs are troubled!—will quickly clear in the solution. Another employment for it is not so generally known: when from age a plate develops with an iridescent band round the edge, which is generally yellow by transmitted light, and thus interferes with its good printing quality, the fault instantly disappears after immersion in the ferricyanide solution, provided that the plate is taken direct from the hypo bath before being thus treated.

Letters to the Editors.

DISCS OF GLASS AS CONDENSERS.

SIRS,—I have also been looking for answers to "Treble X's" query, No. 3370, in the AMATEUR PHOTOGRAPHER of January 17th. No answer appearing, and the letter relative to Mr. Grove's questions, under the above heading, in issue of February 14th, being beside the point, though interesting as an experiment in another direction, I venture to offer my mite of information, having experimented similarly with a manufactured condenser.

My experience differs from that of Mr. Groves in that the illumination through my condenser is satisfactorily diffused, but agrees with his in that I found the focus so long, viz., 3 ft. 4 ins., that the necessary exposure, with a very powerful mineral-oil lamp (circular wick 2 ins. in diameter) was about forty-five minutes. With a full aperture $f/6$, enlarging to three diameters, this was, of course, entirely unsatisfactory, the reason doubtless being that the curvature of the clock faces was not sufficiently convex to obtain the shorter and desirable focussing point for the illuminant.

From my experiments I deduce that—

(1) The form of the glass should be a segment of a sphere of a radius not less than two-thirds of the radius of the sphere from which it was taken.

(2) That the proper position for the illuminant can be found by observation of a light placed behind the constructed lenses, noting the distance at which the form of the illuminating flame is lost by general diffusion of the light.

(3) I found the best method of junction to be marine glue dissolved in ether, painted on the edge of the convex glass (previously ground flat); the convex glass then being laid on a flat square glass slightly larger, it will adhere; the glasses should then be fixed in position rigidly, so that no movement of either was possible, independent of the material used to prevent leakage. Marine glue should then be melted by heat and flowed all round the circumference of the convex glass right up to the wooden frame, and rising a quarter of an inch up the convex glass. No dependence must be placed on the marine glue as a cement to hold the glasses in position, but it can be depended upon to prevent leakages; it is necessary to use the glue dissolved in ether in the first instance, fixing glass to glass, as, if melted marine glue is used, it will be found to cool too quickly before you can work round the edge of the convex glass and are ready to lay it on the flat glass, and the junction is therefore imperfect.

The screen of ground-glass is necessary to use with all condensers, to obtain an even illumination from a lamp, and cannot be dispensed with.

I am using my manufactured condenser fixed in the wall of my dark-room, my dark-room being built inside another room, and having focussed by hanging a lamp close to the condenser outside, I take the lamp away and burn magnesium ribbon 3 ft. back, by hand arrangement, and find forty-five seconds' exposure sufficient, enlarging to three diameters. Enlarging from $7\frac{1}{2}$ by 5 plates I have to stop down, and the exposure is, of course, correspondingly increased; but unsatisfactory as the present arrangement is on account of the length of exposures necessary, I get an even illumination which I failed to make at all certain of previously, when I enlarged by using the magnesium lamp close to a piece of opal glass in the wall of my dark-room, moving the lamp about, which I have not to do now; and the length of exposure is about the same.

Hoping these experiences may be of some little use, I am, yours faithfully,

HENRY E. WALTERS
(Commander R.N.)

SIRS,—I have noticed several letters in your columns expressing the difficulty in making condensers from clock glasses. Having found no difficulty myself, I will endeavour to help those who desire aid. They must first procure the proper kind of glasses, which are barometer, and not clock, glasses; these latter are quite the wrong shape. Also get the brass bezels in which the glasses are fixed (both these can be bought from C. Bannister, 47, Great Hampton Street, Birmingham, costing about one shilling a pair or a trifle more). To mount, fix the convex glass in bezel with a cement (I use the following: two parts powdered litharge, one part fine red lead, mix three parts boiled linseed oil with one

part copal varnish, stir the powder into the liquid until it has the consistency of a stiff dough), apply the cement to bezel, and press glass in it; get a piece of board, and cut a round hole large enough to allow the bezel to go partly through and rest on the flat rim, finding a bearing all round and keeping the bezel in shape; lay board on supports so that glass is quite free from all things under. Get glass level, and fill carefully, not too full, just enough to exclude all air bubbles when flat glass is placed on, which when done finish cementing round flat glass, and your condenser will be complete; leave in the horizontal position until cement is quite dry and hard; screw the bezels to boards and adjust distance with strips top and bottom. Shall be pleased to aid further if desired.

STRADIVARI.

* * * *

"SUN ARTISTS."

SIRS,—My attention has been called to a paragraph reviewing the second number of the above-named serial, which appeared under the head of "Our Views," in your current issue, and in which the following words occur: "We are sure that Mr. H. P. Robinson will not be at all gratified to find that the much-vaunted photogravure has only yielded him prints which are but a shade better than those to be pulled from any type-block."

I beg you will give the enclosed letter from Mr. H. P. Robinson, together with this communication, an equal publicity. I may add, for your information, that so far as technical and artistic excellence is concerned, the whole edition, both of prints and proofs, shows a remarkable uniformity.

In order to neutralise as far as possible the false impression you have put in circulation, I am sending a copy of this letter to the leading photographic papers.—I am, sir, yours obediently,
February 22nd, 1890. W. A. BOORD (Hon. Sec.)

(COPY.)

Winwood, Tunbridge Wells,
January 29th, 1890.

Dear Mr. Boord,—I have received the proofs of *Sun Artists*, No. 2, to sign, and cannot refrain from writing at once to say how much I approve of the way in which my pictures have been reproduced. I expected much, and am not disappointed.—Yours very truly,
H. P. ROBINSON.

[NOTE.—In our comments we wrote of the plates as we found them in the copy which was sent us, we supposed, for review and criticism, not flattery. We have not seen the "proofs" which Mr. Robinson signed, and cannot therefore express any opinion upon them.—Eds: AM: PHOT:]

* * * *

HYDROQUINONE AND INTENSIFICATION.

SIRS,—If Mr. A. E. Venn will refer back to your paper to about fourteen or sixteen months back, he will find a letter from me re hydroquinone and intensification, as I have used quinone for intensification these two years back, so it is nothing new.—Yours truly,
A. R. DRESSER.

February 23rd, 1890.

* * * *

ADDITIONS TO LENSES.

SIRS,—I have been using for some years a simple addition to my lenses, the knowledge of which might be of service to fellow amateurs, especially to those whose means are limited. I procured some concave spectacle lenses, uncut, and circular, just as supplied in the first instance to opticians; these cost me then 6d. each. By attaching them singly to the back of quarter-plate achromatic view lenses, I found that I could lengthen the focus at will and cover plates of various sizes. As the achromatism is slightly disturbed, an extension of one-tenth of an inch beyond the visual focus was required, and the resulting pictures were sharply defined and equal to any lens of similar focus; at least, I can say as much of a quarter lens of C. Shepherd and Co.'s make. Many years ago I used to insert in the diaphragm between the lenses of the old-fashioned portrait combinations, a smaller spectacle lens, which lengthened their foci without visible disturbance of achromatism, and it is only in the *English Mechanic* of 21st inst. that I saw Mr. Blackwood, of Beckenham, has patented an achromatic modification of this principle, so far as placing the additional lens between the doublets, and in front of single lenses. The employment of achromatic concaves, etc., is a distinct improvement, and you will observe that my plan with the latter lenses is to place the concave behind and very close to them.

I took with me into Derbyshire, in 1888, my half-plate camera, and mostly used the Shepherd quarter-plate view lens of $4\frac{1}{2}$ inch focus, supplied with a concave lengthening it at will to $8\frac{1}{2}$ inch, as it gave a large angle and excellent definition. I enclose a print from one of the negatives so taken for your inspection; it is a view of the Royal Hotel, at Matlock. I believe the late Mr. Scott Archer, the inventor of the beautiful collodion process, had similar contrivances with lenses. By the by, now that Daguerre is so highly lauded (even by Rev. Ledger, in his admirable astronomical lectures) as the inventor—as if sole—of photography, I regret that our English discoverers are so little thought of and left in the background. Having worked both the calotype and wet collodion processes as they arose, I have a veneration for these gentlemen who discovered and gave us these beautiful processes.—Yours, etc,
WM. LONDON.

February 22nd, 1890.

[NOTE.—The print sent us shows perfect definition and no distortion.—Eds: AM: PHOT:]

* * * *

PHOTOGRAPHY IN INDIA AND BURMA.

SIRS,—As there have been various inquiries lately in your paper about photography in India and Burma, a few notes on this subject may be interesting. They will be too late for people intending to do India this cold weather, but may come in useful at another time.

As to Apparatus.—Most tourists coming out to India only spend the cold weather (say Nov. to Jan.) in the country. The temperature then is not much above that of a good hot summer's day in England; and apparatus which will stand the latter will not be hurt by the Indian climate. For a stay through a hot season or the rains, however, apparatus should be very carefully chosen. I do not believe it is possible to season wood in England so thoroughly that it will not warp or shrink under such varying conditions of temperature as those occurring during a year of an Indian climate. One's reversing back, if it is of the removable order, very probably shrinks, and consequently lies loosely in the clips, instead of fitting tightly; and one's slide-shutters curl up like corkscrews. One need not be afraid of having everything substantial and heavy, as one can always get a coolie to carry a camera all day for a few annas. I would strongly advise a hand-camera as well as the ordinary article. I am just getting one, and wish I had got it before. As to lenses, one which works well in England will work better here, in the brighter and more actinic light. As to tripods, get a good steady one, and of simple construction—weight, as I have said, is no object.

Plates.—I began with Britannias; but I gave them up. I then took to Wratten and Wainwright's, and have used no others since. Only one bad plate have I come across in all that I have used. I find the Ordinary (15) and Instantaneous (19-20) the best. I have used Special Drop-shutter (25), but they are usually a bother to develop, and in the Indian light one can do drop-shutter pictures on the Instantaneous plates with excellent results. I am going to give Ilford's a trial with my hand-camera, as I cannot get Wratten and Wainwright's quarter-plates just now. I have never used films, but have been told they are a trouble to work in hot weather.

Exposure.—Whatever you do, don't let the sun get into your lens. Shade the latter carefully. If you want good light and shade effects, photograph either early or late, but not in the middle of the day. The sun is so nearly vertical at noon that there are no shadows at all, and pictures taken then look flat. I have never photographed in England, but the following notes of exposure may be of use (rapidity of plate by Warnerke's sensitometer):—

Rapidity, 15; time, 8.45 a.m.; subject, well-lighted pagodas; stop, $f/32$; exposure, 30 secs.; result, good.

Rapidity, 15; time, 8 a.m.; subject, brightly lighted wooden house; stop, $f/22$; exposure, 6 secs.; result, very good.

Rapidity, 19-20; time, half-an-hour before sunset; subject, tents under mango trees, fairly lighted; exposure, 4 secs.; stop, $f/16$; result, first-class.

Rapidity, 19-20; time, 10 a.m.; subject, trees with very deep shadows; stop, $f/44$; exposure, 45 secs.; result, somewhat over-exposed.

I usually give the right exposure as near as I can; in doubt, overdo the exposure a little; develop slowly, and watch the plate carefully.

Development.—A common candle is a good light to develop

by, and doesn't fog even a 25 plate, if one puts the candle on the ground to begin with, and develops at first by the light reflected from the ceiling, etc. I carry a ruby lamp, but merely as a guarantee of good faith. I use pyro to develop with, keeping it dry, and have used various alkalis. Ammonia is rather too violent, I think; I have used potass. carbonate alone, and with sulphite, with good results; lately I have been using Beach's potash solution, and am now going to try the ferrocyanide plus carbonate for a change. I only tried once hydroquinone as a developer, and didn't like it; but the subjects of the pictures were not good, and I had no practical experience with the developer. As to operations after development, *I never use an alum bath with Wratten's plates.* I have developed in a temperature of 105° F., and the plates did not frill. Fix in hypo as usual.

Printing.—It is next to impossible to get really good sensitised albumenised paper ready made, I find. I had been reduced to sending my negatives to professionals to print, and began experiments with platino. I started on Pizzighelli. The first lot of paper was splendid, the next execrable. Then I tried cold-bath, but think I must have always over-exposed—results, not good on the whole. Last, I took to hot-bath, with the most excellent results; the paper, two months old, behaved perfectly, and I should strongly advise anyone coming out for a few months to bring a supply from the Platinotype Company, and use that process. I have not tried Aristotype, Clark's or Blanchard's processes, etc.; but I think the drawback of all silver-printing is the difficulty of getting pure water and good paper.

I enclose my name and address at which letters will reach me. If anyone wishes for further information, I shall be happy to supply it as far as possible; but letters posted after May 1st will probably not catch me, as I hope to be leaving for England early in June.—Yours very truly, Z. Q. A.

Upper Burma, Jan. 29, 1890.

* * * *

GAS CYLINDERS.

SIRS,—I was interested in reading your leader on this important subject, and I trust that now the matter is being taken up, we may be able to arrive at the truth as to whether these useful cylinders are perfectly safe or not. You mention that a cylinder exploded with fatal results at Woolwich some years ago. Now, it would be advisable to ascertain in that case, as in all the others, whether the cylinder contained a mixture of oxygen and hydrogen. It seems that in other cases the cause of the explosion is put down to the mixed gases, and not to the simple pressure of the condensed gas.

You throw out the suggestion that probably the oxide of iron in the bottle may have been an initial cause of the explosion. All factors require most careful consideration.

With regard to the testing of cylinders, I was cogitating how this was done when, from a letter in *Photography*, it appears that they are tested by hydraulic pressure! This can scarcely be called a perfectly satisfactory test, as far as the liability of the bottle to sudden explosion is concerned, for, as the writer of the letter points out, water is not a very compressible body, and hence, supposing the cylinder to be weak, the pressure of water from within would not exert anything like the same power as a cylinder full of compressed gas. The water if forced out or let out of a cylinder would not be of much larger volume than in its compressed state. But in the case of gas, the volume of that when liberated would be immense, as compared with the space it occupied in its compressed state. Therefore, surely it is not correct to reason from the hydraulic test, that a cylinder would not explode, but only "rip up," when compressed gas is the motive power within.

If rust has any influence in the matter, then the water test would probably cause its formation in the cylinder.

Would it be a fair illustration to make an experiment in this wise—

Fill a stout bottle with water within half an inch of the top, then insert a good cork, and hammer it in till the bottle bursts. Probably the weakest part of the bottle would pop out without much sound and fury.

For the next experiment fill a bottle one quarter full of hot water, then cork it up and tie it securely down, then put it in a hot oven till something happens. We should hear and see the result, and the pieces would scarcely be few!

If this is sound reasoning, then I think it rests with the gas

companies to test a cylinder with compressed gas till it bursts, and if the cylinder merely rips, we shall be delighted at the result of the experiment. For this test a cylinder of half or a quarter the usual substance would suffice, the only point being that it shall be burst with compressed gas, and the pressure noted. Surely science can suggest a safe method of performing this desirable experiment. Might not the bottle be surrounded by sand, after being put in a wood case, to prevent actual close contact with sand to bottle?

The matter deserves attention, for if an explosion occurred in a lecture room, some people might wish to claim damages for an accident from cylinder company. However, I trust the pressure of public opinion will force the companies to resort to a perfect test, as, no doubt, they are fully desirous of taking every precaution.—Yours truly,

C. HETHTON LEWIS.

February 24th, 1890.

* * * *

THE AMATEUR: WHAT MAY HE DO?

SIRS,—The query 3,482, with the above title, is simply the raising of the old, old question, one which is regularly trotted out each year, and as regularly shelved. Since there is no body or authority to deal with the matter, let amateurs, through the medium of the Press, and by discussion at amateur photographic societies, set the matter at rest, and agree that an amateur photographer is one who practices the art of photography for pleasure, and not for purposes of gain by the sale of his negatives or prints.

An amateur may give photographs for sale at bazaars, but must accept no payment or valuable consideration in lieu of payment for same.

An amateur must not receive out-of-pocket expenses from friends, or otherwise, for the taking of a negative or making prints.

An amateur publishing a book or writing for a periodical, and illustrating it with photographs, shall not forfeit his status by so doing.

An amateur giving lectures, and illustrating his lecture by photographs, shall not forfeit his status by so doing.

An amateur may be a maker of plates, lenses, cameras, or any and every article in connection with photography.

An amateur may hold shares in any limited company having for its object the taking of photographs, or may be a partner in any firm reproducing the work of others for purposes of illustration.

An amateur knowingly competing in a class open to professionals, shall lose his status as such thereby.

An amateur shall not receive money prizes.

A professional photographer having retired from business, shall, after twelve months' retirement, be considered eligible to rank as an amateur.

The term professional shall not apply to professors or teachers at colleges, schools, naval, military, or public institutions.

That the qualifications of an amateur shall be printed on the entry form.—I am, yours truly,

EDWARD J. FEILDEN.

Feb. 24th, 1890.

A LECTURE on "Astronomical Photography" will be given by the Gresham Professor of Astronomy, on March 3rd, at Colchester, under the auspices of the Colchester Camera Club.

FITCH'S IMPROVED XYLONITE FILMS. — We understand that Mr. Fitch, of 34, Angell Road, S.W., has a large sale for these, and that some twelve months since he put on the market his "positive ivory films." We have been favoured with two specimen pictures taken upon them, which are very charming, especially a portrait study. Full particulars are given as to development, either with the ferrous oxalate or hydroquinone developers. These positive films can be procured in three tints—white, blue, and pink.

APPLICATION OF PHOTOGRAPHY TO METEOROLOGY. — The Council of the Royal Meteorological Society have arranged to hold, at 25, Great George Street, Westminster (by permission of the Council of the Institution of Civil Engineers), on March 18th to 21st next, an exhibition of instruments and photographs illustrating the application of photography to meteorology. The Committee will also be glad to show any new meteorological instruments or apparatus invented, or first constructed, since last March, as well as photographs and drawings possessing meteorological interest.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 102.)

CHEMICAL CHANGES.

SINCE a chemist is concerned largely with chemical changes, or the phenomena which result from the contact of different forms of matter with one another, we must make ourselves acquainted with the outward and visible signs which indicate that a chemical change has taken place. Many everyday occurrences, such as the rusting of iron and the burning of a candle or of coal, are examples of chemical changes. In the first case the change is indicated by an alteration in colour and appearance, in the second by the conversion of the solid candle or coal into invisible gases.

EXPERIMENT 10.—Dissolve two or three crystals of potassium permanganate in 50 c.c. (2 ozs.) of water, and add to the solution two or three crystals of ferrous sulphate previously dissolved in water and mixed with 2 c.c. (30 fl. grs.) of sulphuric acid. The dark purple colour of the permanganate will disappear.

EXPERIMENT 11.—Dissolve a small quantity of pyrogallol (pyrogallol acid) in water, and add to the liquid a few drops of a solution of ferrous sulphate which has been exposed to the air for some time; a deep indigo-blue colouration is produced, which changes to green and finally to deep red.

EXPERIMENT 12.—Shake two or three fragments of litmus with 50 c.c. (2 fl. ozs.) of cold water, and mix the deep-blue solution thus formed with a few drops of any acid; the colour will change to red. Now add to the red liquid a few drops of ammonia or caustic soda solution; the blue colour will be restored.

From these experiments we learn that *a chemical change may be accompanied by an appearance, disappearance, or change of colour.*

EXPERIMENT 13.—Pour two or three drops of strong ammonia solution into a boiling tube, warm it gently for a few seconds, and then turn the tube upside down, and place it with its mouth on a piece of paper slightly smeared with lard. The tube will now contain invisible ammonia gas. Place in another boiling tube a few drops of strong hydrochloric acid, heat it to boiling for a few seconds and remove it from the lamp; the tube will now contain hydrochloric acid gas. Raise the tube containing the ammonia from the greased paper, and, keeping it with its mouth downwards, bring it over the tube containing the hydrochloric acid (which is kept with its mouth upwards), and bring the mouths of the tubes together. The two gases interact, and a solid substance is formed, which first appears as a dense white smoke, but after a time separates in small crystals on the sides of the tubes.

EXPERIMENT 14.—Hold a perfectly clean and dry beaker over a small gas flame for a short time, and observe that the inside of the beaker becomes dim, owing to the deposition of some liquid. This liquid is water, formed by the combustion of the gas (which is a chemical change) and condensed upon the cold surface of the beaker.

EXPERIMENT 15.—Dissolve 1 gramme (15 grs.) of mercuric chloride in 50 c.c. (2 ozs.) of water, and add 7 c.c. (or 100 fl. grs.) of a solution made by dissolving 10 grammes of potassium iodide in 100 c.c. of water (or 100 grs. in 1,000 fl. grs. of water.) A yellow solid will be formed, but will almost instantly become salmon-coloured, and will gradually change to deep scarlet, and settle to the bottom of the vessel as a heavy powder.

Filter off this powder, wash it two or three times by filling the

filter just up to the top of the paper with water, and allowing it to drain completely each time, and dry it by placing the funnel containing the filter in a warm, but not hot, place. Detach the scarlet powder from the paper, place it in a well corked tube or small bottle, and label it "mercuric iodide."

EXPERIMENT 16.—Dissolve 1 gramme of lead nitrate in 50 c.c. of water, and add 10 c.c. of the same potassium iodide solution; a beautiful yellow solid substance will form, and will settle to the bottom of the vessel.

A solid substance formed by the interaction of liquids as in the two preceding experiments, is called a *precipitate*.

When coal burns, the greater part of it disappears, because it is converted into invisible gases, and when paraffin oil burns, the greater part of that is likewise converted into an invisible gas; and from these familiar facts and the preceding experiments, we learn that *a chemical change may result in a change of state; gases may be converted into solids or liquids, liquids into gases or solids, and solids into liquids or gases.*

Notice also that changes of colour may accompany the changes of state. In experiments 15 and 16, brightly coloured precipitates (solids) are obtained from colourless liquids.

The burning of a candle or of coal, and all the other familiar cases of combustion, are examples of chemical changes which are accompanied by the development of heat. In very many other cases there is development of heat, although the substances do not become red hot.

EXPERIMENT 17.—Mix 50 c.c. of strong sulphuric acid with 50 c.c. of water, by pouring the acid in a thin stream into the beaker containing the water, stirring all the time with a glass rod, and taking great care to avoid splashing. Observe that the liquid becomes very hot. Ascertain the temperature by means of a thermometer.

N.B.—Whenever strong sulphuric acid has to be mixed with water, the acid must be poured *into the water* with constant stirring, and not *vice versa*. The liquids must be mixed in a thin glass vessel or in an earthenware jug, and not in a thick glass vessel, which would probably crack in consequence of the rapid rise of temperature.

EXPERIMENT 18.—Dissolve 5 grammes of caustic potash or caustic soda in 25 c.c. of water (60 grs. in 300 fl. grs.) Allow the liquid to become quite cold, add a few drops of litmus solution, ascertain the temperature by means of the thermometer, and then add 7 or 8 c.c. (100 fl. grs.) of strong hydrochloric acid, stirring carefully with the thermometer. Observe that the temperature rises, heat being developed by the action of the acid on the caustic potash or soda. The change in the colour of the litmus gives another indication that a chemical change has taken place.

We therefore find that *in many cases a chemical change is accompanied by the development of heat.* In some cases, however, there is an absorption of heat.

(To be continued.)

LITERARY PHOTOGRAPHIC CLUB.—Mr. R. A. R. Bennett writes from Walton Manor Lodge, Oxford, "Would you mind putting a short notice in the AMATEUR PHOTOGRAPHER's next number, saying that I have some vacancies in the Literary Photographic Club, and that anyone wanting to join must apply to me? I have no other means of making it known."

REDUCING CAMERA.—Mr. John Platt writes: "*Re* Pearson and Denham's Reducing Camera. I have had the sliding rod arrangement, mentioned in last week's AMATEUR PHOTOGRAPHER as being a novel feature in this camera, in use over thirty years since."

We have received an ingenious and elaborately got-up Calendar from Messrs. Scovill and Adams, of New York (the *Photographic Times*). It is framed, and is embellished by pictures illustrating early life in America from 1630 to 1690, and is altogether both interesting and ornamental.

Winter Work.—XXI.

By T. C. HEPWORTH, F.C.S.

HINTS ON ENLARGING.

(Continued from page 119.)

In order to make my remarks clear concerning the construction of these large glass-bottomed dishes, I here offer a diagram (fig. 1), which is a sectional view of one of the sides with the glass bottom inserted in its groove as already explained. In making this form of dish it is as well to place the glass *in situ*, and to see that the corners will come together nicely before any cement is applied to the groove. If this should be the case, it will then be the time to fill in the groove with its mixture of white and red lead, a large portion of which will be forced out as the glass is firmly

FIG. 1.

FIG. 2.

pushed into its place. This superfluous stuff should be neatly removed and finished off with a knife when the wooden frame has been joined together. A first-rate carpenter will, of course, use a dovetail join here, but I prefer to simply pin the woodwork together with French nails, for should the glass bottom be at some future time broken, it can then be easily replaced by forcing asunder the corners of the dish. There is no kind of strain upon the woodwork, and the nails will be found all-sufficient.

A still simpler form of dish can be arranged as a makeshift out of four laths placed as shown in fig. 2. It is obvious that laths so placed can be made to form a rectangular frame of any size. The laths should be arranged as shown to suit the dimensions of the paper enlargement, and should rest on a moveable flat surface, such as a drawing board. After exposure, the paper should be thoroughly wetted, drained, and laid face upwards, so that the four edges just lap over the laths. The paper will now form its own dish, and the supporting board can be raised and inclined at any slope so as to coax the developer in any required direction. This plan is, of course, a makeshift, and has its disadvantages, but it is worthy of mention here as a means which may be adopted when no better one is available.

With regard to the method of supporting the paper in front of and square with the enlarging lens, little need be said. Any form of upright easel which will bear a board upon which the paper can be pinned during exposure, will answer the purpose, and perfection of arrangement is reached when this easel can be made to travel on rails or laths attached to the floor, to and from the lens. In this way the scale of enlargement is increased or diminished at pleasure. A square box with an upright board nailed to one of its sides, and projecting upwards for four or five feet, is as good as anything that can be devised. The box can be made to run between two guiding laths on the floor, and

the upright board will form a vertical easel. The paper can be readily attached to the board by means of ladies' bonnet pins, which are far more easy to handle in a darkened room than are the usual flat-headed drawing pins.

It may be thought that there is some difficulty in attaching a gelatine plate to this form of upright easel when it is desired to produce an enlarged negative instead of a positive on paper. There is no difficulty in the matter; indeed, strange as it may seem, the attachment of a glass plate to the surface is easier than pinning up a sheet of paper in the same place. By driving into the board three 2-in. French nails in the positions shown in fig. 3, taking care that they all incline inwards—that is, towards the centre of the board—a glass plate can be supported with ease and safety. The two lower nails serve as a shelf to rest the edge of the glass upon, and the single nail above, against which the right-hand upper edge is placed, keeps it from tumbling forwards. This clever little dodge I saw in practice at the Richmond works of Messrs. Morgan and Kidd, who fasten up large opal plates in this manner during exposure. This simple expedient is of service in another way. Let us suppose, for instance, that an enlarged negative shows during development that it has not received sufficient exposure. The developer is washed off, and the negative can once more be placed under the influence of the lens, and, provided that no part of the enlarging apparatus has been shifted, its place on the three nails will bring it into the exact position with regard to the lens which it occupied in the first instance. Partial development has, it is true, robbed the film of fifty per cent. of its sensitiveness, but it is still sensitive for all that, and the extra exposure will quickly tell under re-development.

Another point may usefully be considered here in the addition of clouds to a landscape the negative of which is dense and opaque. The method to which I am about to refer is applicable to a positive on paper, or on opal or

FIG. 3.

plain glass, and I see no reason why it should not be applied to the production of an enlarged negative from a small positive. But the principle is best explained if I suppose for the nonce that it is desired to finish a positive on opal plate with clouds from a separate negative. The clouds must, of course, be suitable to the landscape in question, and this matter has been fully dealt with in a previous page. The plate having been supported on the easel upon the three nails, receives the normal exposure, and is then developed. Development is only allowed to proceed to a certain point, when the plate is placed under the tap and is rinsed and drained. It is now replaced upon the supporting nails, and while the half-developed landscape is kept shielded by a card from the action of the lens, a cloud negative is allowed to trace its image on the blank upper portion of the plate.

This second exposure having been carried on to a sufficient point, the plate is once more developed, and as the land cape portion acquires full density, the clouds gradually make their appearance. This method of working is most successful, and is in daily operation at those same works at Richmond where I learnt of the little dodge with the three French nails.

Many forms of enlarging apparatus are now supplied by different makers, and although they differ in detail, they are necessarily the same in principle, and take the form of an optical lantern with a large condensing lens. Anyone who already possesses a lens suitable for enlarging can, by investing in a large condenser and a good three or four inch lamp burning mineral oil, rig up an enlarging apparatus for himself which will do good work. The best form of lens to employ is one of the portrait variety, for it is so quick in action, and when we are dealing with a comparatively subdued light, like that given by oil, the exposure becomes very protracted if we use other forms of lenses. The Euryscope is but little behind the portrait lens in the matter of speed, and I have found it invaluable for the present purpose.

In fig. 4 I have endeavoured to picture the way in which the various parts of the suggested rough-and-ready enlarg-

FIG. 4.

ing apparatus can be arranged. On the right hand side of the figure is the lamp, and against it is the double condenser, set for convenience in a wooden block. On the same block, on the side farthest from the lantern, are grooves to hold the negative which is to yield an enlarged positive on the distant easel, and on the left-hand side of the figure is the enlarging lens, fitted on to a camera. In practice, of course, all these different parts will require adjustment according to the focus of the lenses employed and the amount of magnification to which the image is subjected. Supposing that the operator elects to employ such a combination as suggested, his work should first of all be strictly experimental. Let him decide upon the size of the image which he requires, and place the various component parts of the apparatus upon a flat board. He can then light the lamp, fix a negative in the groove provided for it, and rig up a sheet of cardboard to project its image upon. The first requisite is to obtain a clear disc of light, which is only possible when both lenses are accurately centred with the flame of the lamp. Both condenser and camera will probably require support upon pieces of wood before the right position is obtained. Next, the distance of lamp from condenser, and objective from condenser, must be seen to, and when both are in place, their position should be marked upon the base-board for future reference. The tables relating to enlargement will be useful, and can easily be found by reference to the annuals.

If, from the particular form of lamp employed, dispersed light should make itself troublesome, a sheet of cardboard with a hole in it, through which can project the camera lens, will form an efficient screen, or with a little ingenuity the entire arrangement can be boxed in. A square box with the lens fitted to it will answer the purpose of the camera, and the lens should have, if possible, a rack and pinion adjustment for the purpose of delicate focussing. Exposure should form the subject of many trial slips of paper, for it is quite impossible to give any useful information upon the point, so much do the bromide papers of commerce differ in their rapidity.

Where unusually large pictures are required, the oil lantern is not a desirable illuminant, for the exposure required is enormous. In such a case the worker will do well to employ the limelight, which can easily be adjusted to the same form of apparatus.

“Thursday Evenings” at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, February 20th, a paper communicated by Mr. W. K. Burton was the subject for discussion at the Club. The title of the paper was “One or Two of the Tenets of the Naturalists.” Mr. Pringle read the paper. Mr. W. A. Greene occupied the chair.

Mr. Burton, in his paper, took the view that any want of sharpness in the principal objects or plane, and any falling off away from the centre of interest in the different planes, could not be defended upon optical principles, but that, on the other hand, these principles would appear to demand that planes other than the plane of chief interest should be less perfectly defined. He further referred to the subject of imagination in the pictorial arts, and to the possibility of introducing it in photographic work.

The discussion was opened by a paper read by Mr. Davison, in which he observed that the variation in focus of different planes, admitted and argued by Mr. Burton, was one of the chief contentions of those called naturalists. He thought it was more a matter of the mental attitude, whether representations should be sharp or not. A definite detailed examination of nature was the scientific, not the artistic, attitude. He thought imagination could not be expected to supply the truth of representation (an analytical, not a realistic representation) in which lay the thrilling charm experienced by an artistic perception of a beautiful scene in nature.

An animated discussion was carried on by Messrs. Shipton, Humphery, Sturme, Pringle, Clift, Davison, Maskell, Jerome Harrison, and the Chairman. A letter from Mr. Graham Balfour upon the subject was also read.

On Thursday, March 6th, Mr. Pringle will treat of the subject “The Optical Lantern.” Meeting at 8 p.m.

THE Boston (U.S.A) Camera Club have announced another lecture illustrated by lantern slides, entitled “Glimpses of California.” The slides are entirely the work of members of the Pacific Coast Amateur Photographic Association of San Francisco.

WE have received, too late for publication, a short report of the opening ceremony, and a list of awards for exhibits at the Hastings and St. Leonards Photographic Exhibition, which has been promoted by the local Society. We shall give a more extended notice in next week's issue.

“FALLOWFIELD'S PHOTOGRAPHIC REMEMBRANCE” for the quarter ending March is of considerable interest now the time for hand-camera work is coming, as it contains a good description of the “Facile,” one of the best hand-cameras in the market. It also contains cut of a new walking-stick stand, for use with the “Facile,” which is said to have no equal for rigidity. The paper is accompanied by process reproductions of four pictures taken with the camera referred to.

Our Contemporaries at Home and Abroad.

Anthony's Photographic Bulletin (New York), speaking of "Systematic Work for Photographic Societies," says, "What particular purpose does each one serve? That the members are lovers of photography, goes without saying. That each one is a member of the society he or she belongs to for the purpose of acquiring skill in the use of photographic apparatus may also be taken for granted. And yet there are quite a number of members who, after going a certain distance in this process of education by association, ultimately exhibit a lack of interest in the art, and may possibly fall out of the ranks. To overcome this tendency to lose interest in photographic societies, some organised effort at systematic work among the members appears eminently desirable." Articles: "A New Method of Mounting Photographs on Paper without Cockling," "Certain Processes for Toning Opalotypes and Aristotypes," "Pyrocatechin Development," "Dust," etc.

The *Boletín Fotográfico* (Havana) contains articles on "Platinum Printing," "Eikonogen," "Orthochromatic Gelatino-Bromide Plates," "Pyrocatechin," etc.

British Journal of Photography, in an article on "Some Fallacies about Residues," says, "We are inclined, however, to believe that the greatest fallacy of all in connexion with residue reducing is that of attempting, when the material is not on a manufacturing scale (except as a single experiment or two done for the purpose of obtaining knowledge), to bring the residues into the metallic form before obtaining value from the refiner." Among the editorial notes the question is asked, "Is it not a mistake for photographers to send out so many proofs of a portrait as some artists are now doing? Setting aside altogether the question of the extra expense entailed, and the conveying to the mind of the customer the idea that the artist's time is of little value, and the cost of material must be small, is it good policy?" Articles: "Development by Means of Vapour," "Carbonate of Soda as a Dessicating Agent," "An Illuminating Reflector for Copying Purposes," "Silver Printing by Substitution," "Stereoscopic Photography," etc.

Journal of the Photographic Society of India (Calcutta) says, "I wish something could be devised as an efficient substitute for medal and diploma awards at photographic exhibitions, or that some salutary restrictions were placed upon exhibitors as to the pictures they send in competition for these awards. When we see the great dry plate firms at home offering a number of gold medals as prizes for pictures taken on their make of plates, and competitors flocking by the thousand to compete for them, it may well make societies like ours pause, and ask if the time and money of the members could not be spent to better purpose than in medalling a mass of pictures which go the rounds of the exhibitions as do champion fox terriers the dog-shows. It would be some check to this practice were pictures once medalled at any exhibition debarred from competing at another. But the question arises—How then are we to have an opportunity of seeing the best works of the day?" Articles: "Picture Making by Photography," "The Indian Amateur Photographer," "The Exhibition," etc.

The *Parkhurstian* contains a fairly good bromide print from a negative of the school, with the masters' cottage beside it, and also an interesting little article on "Ants."

Photography, on the question of "Judges," says, "There are doubtless, other disqualifications, but we have said sufficient to show that very much room for improvement exists in the selection of judges. And, what is more, it will ere long become a burning question, as the best known men drop off one by one through lack of faith in either the capability or the impartiality of the judges chosen. Promoters of exhibitions, see to it." Articles: "Safety of Gas Cylinders," "On the Reasons for the General Inferiority of Enlargements as Compared with Large Work Done Direct," "Photographic Benevolent Association," "An Exhibitor's League," "Improvements in Sensitive Films," "A New Limelight," etc.

Photographic News, speaking of the question of nomenclature in "The Report of the International Photographic Congress," says, "The Congress has, in this matter, accomplished some use-

ful work, in attempting to bring chaotic nomenclature into something more resembling law and order. How far the improvements it advocates will—either before or after their revision by other Congresses—be brought into general use is another question. The higher the education of any scientific fraternity, the easier it is to introduce more accurate terms; indeed, chemistry and physics have seen vast improvements in this respect within the memories of many persons now living. The lower the education of any scientific fraternity, the more conservatively does that fraternity hold on to words it has once adopted, however unsuitable those words may be. Photography includes all sorts and conditions of men, so how any attempt to revise its scientific nomenclature will succeed, remains to be seen." Articles: "Films on Glass Surfaces," "Action of Heat on Sodium Carbonate," "An Iso-Radial Focussing Eyepiece," "Destruction of Dry Plates by Insects," "Stereoscopic Photography," "Isochromatic or Orthochromatic," "Photo-Lithography, and the New Albert Photo-Lithographic Transfer Paper," etc.

Photographic Times (New York), in an article on "How to Recover Gold from Old Toning Baths," says, "If we were to add to such a toning bath (alkaline) a small quantity of hydrochloric acid, and neutralise the excess of acidity again with the alkali or alkaline salt previously used, the activity of the bath would be restored and toning continued, provided there was gold enough in the bath to carry on the process. This method of restoring a seemingly spent toning bath is little known, and the lack of this knowledge occasions the loss of large quantities of gold." Articles: "Home-Made Trays," "Transparencies and Lantern Slides," "Artificial Clouds," in the course of which it gives the following suggestion: "Very passable cloud effects may be had by an easy means. If the negative be a quick printer, apply retouching varnish to the back of the plate, rubbing it on with the finger, keeping up a rotary motion, and carrying the circles of varnish well down to the line of the horizon. Then allow to dry. Scrape lead from a soft pencil, and rub it down with the finger on some coarse surface like slate until it is very fine. This may then be applied with the finger or brush to the varnished back of the negative. The lead will adhere somewhat unevenly, giving more printing density in some parts than in others, which is just what is desired, and, when a proof print is taken off, little corrections can easily be made in shading off too ragged edges by applying a little more lead where needed, or using powdered pumice on the finger by rubbing a little off," etc.

Revue Suisse de Photographie (Geneva) contains an article on "Photography for Beginners," and there are several process block reproductions of pictures. The general conclusions of the recent Congress are given.

The *Studio* (New York) still keeps up its interest and style, both with respect to articles and illustrations. The articles are on "Terra Cottas and Vases at the Union League Club," "A Cruikshank Trovato," "Pablo Sarasate," "The Tudor Exhibition," "Sir E. Arnold on the Japanese," "American Notes," "Of Dyeing as an Art," "Daute G. Rossetti," etc.

Wilson's Photographic Magazine (New York) says, "The question has been raised whether an amateur has any right to photograph everything he may desire, and without the knowledge or permission of the subject, when the subject is a person. Armed with a detective camera, the amateur is, indeed, a formidable personage, and unsuspecting people may well tremble when caught in some ridiculous or compromising position. Many amateurs have undoubtedly carried the thing too far, and are often justly rebuked for what is simply an impertinence. But there are subjects legitimately open to the instantaneous photographer which cannot be depicted in any other way. The field is an almost inexhaustible one—marine pictures of all kinds, including shipping, surf, and regattas, fleeting cloud forms, street life, animal studies, and, indeed, all objects in motion." Articles: "Some Working Particulars," "Practical Points from the Studios," "Transparent Cyanotype Prints," "Upon Some Methods of Finishing Photographs," "Raising of the Gelatine Film," "Platinum Process," etc.

THE BIRKENHEAD PHOTOGRAPHIC ASSOCIATION will give a public concert at the Claughton Music Hall this evening (Friday), arranged by Mr. W. H. Hunt, Mus. Doc. The chair will be taken at 7.15 p.m. by the President.

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

ARNEY CAMERA CLUB.—At the usual weekly meeting held February 21st, Mr. Adkins gave a demonstration on carbon printing. In his paper he sketched the process from its earliest days to the present time, and afterwards successfully conducted the various operations incidental to the single and double transfer processes. The vote of thanks was moved by Mr. Moon and seconded by Mr. Quin. The first of a series of Club competitions was announced for March 28th, the subject being "Gelatin Lantern Plates: Contact Printing." On March 7th there will be an exhibition and discussion on detective cameras, to which all local amateurs are cordially invited.

BOSTON (U.S.A.) CAMERA CLUB.—The members of this club met at Union Hall, 18, Boylston Street, on the 21st inst., for the purpose of hearing a lecture on "The White Mountains," which was illustrated by a series of magnificent slides. The Rev. W. F. Dusseault was the lecturer.

CARDIFF AM: PHOT: SOC:—The usual weekly meeting of the above Society was held at their studio on Wednesday the 19th inst., Mr. E. Lewis in the chair. The following gentlemen were duly elected ordinary members: Rev. Archdeacon Bruce, Thos. E. Heath, and Mr. H. J. Davis. The lecturer for the evening, Mr. Bert Harris delivered a very instructive discourse on "Photographic Faults," pointing out the errors in lighting, posing, retouching etc.; distortion both from paper and lens defects; also dealing in a very exhaustive manner with the untrue rendering of colours. A lengthy discussion followed. Mr. Booth mentioned that some of the kindred societies were making photographic surveys of their different counties, and considered it was a matter worth taking up *re* Glamorganshire, promising at a later date to bring the subject more prominently before the members. Last Wednesday Mr. Josty was announced to lecture on "Home Portraiture, and How to Construct a Studio," illustrated by models.

DUKINFIELD PHOT: SOC:—The second annual exhibition of this Society was held on Thursday, Friday, and Saturday, the 20th, 21st, and 22nd inst., at the Co-operative Hall. The Society must be congratulated on the entire success of its efforts. The prints exhibited were of a high standard, and the patronage they received must be very gratifying to the members. Upwards of 800 prints were exhibited (a large number being framed), the hanging being very tastefully done. All known processes were represented. The proprietors of the AMATEUR PHOTOGRAPHER kindly lent the "Church Architecture" competition prints, a number of which were hung and much admired. On Thursday evening a large number of members' lantern slides were thrown on an 18 foot screen, by Mr. Fred. W. Cheetham. On Friday a set of slides illustrating the Manchester Jubilee Exhibition were exhibited, in addition to sets kindly lent by the Woodburytype Company, and Mr. T. B. Sutton, of Liverpool. On Saturday a soirée was held for members and a limited number of friends, and dancing and songs were not the least attractive items of the evening. The attendance was very satisfactory during each of the nights the exhibition was open.

HOLBORN CAMERA CLUB.—On Friday, 21st, about thirty members attended to hear a lecture by Mr. Clifton on carbon printing. Mr. Chang having been voted to the chair, presented the Club with two framed prints and two lantern slides of the recent flash light groups taken by him, also a framed print for the Holborn Cycling Club. Two new members were elected, and Mr. H. Thompson was proposed a member of the Club. Mr. Clifton then commenced his demonstration on carbon printing. As the light had been so bad for printing all day, it was only through the kindness of Mr. Cattell, who started his gas engine and dynamo, and put on a 3,000 candle power lamp, that Mr. Clifton was enabled to get any prints to bring with him. After removal from the frames they are placed, face down, in warm water, when they immediately curl face inward, and almost directly commence to uncurl. When they are flat on the surface, squeegee on to opal, place a piece of blotting-paper and a weight on top, and allow to stand for ten minutes, then put in warm

water, and after a few minutes the paper support can be removed and development commences. The principle of the process consists in the fact that bichromated gelatine that has been acted upon by light is rendered insoluble, while the high lights not having been so, are easily washed away, leaving a picture composed of various thicknesses of pigmented gelatine. Mr. Clifton having produced several very successful prints on opal, received a most unanimous and hearty vote of thanks for his kindness in coming. Friday, 28th, lantern night, when the illustrated Boston slides will be shown on the screen. Visitors will be welcome. Pictures for the Club exhibition can be received at the Club room any evening this week. The Club Cinderella and Exhibition will be held at Anderton's Hotel, 8 p.m., on Saturday, March 1st.

KENDAL LIT: AND SCI: INST:; PHOT: SEC:—The meeting of this section was held on the 19th inst., Mr. Isaac Braithwaite in the chair, a large attendance of members and some friends being present, and the offer of a copy of "Pictures of East Anglian Life," by Dr. Emerson, was accepted with many thanks. The evening was devoted to the exhibition and the judging of lantern slides (sets of four) made entirely by members. Twelve competed, and the voting resulted in the first prize for the best set being awarded to Mr. John Armistead (Dalton), while the same gentleman was successful in being awarded first for the best slide. The slides as a whole were considered very good, showing considerable improvement on the exhibition of last year; the winning slides were decidedly good, and well deserved the position assigned them. Two series of views illustrating respectively mountain and river scenery, were, by the kindness of the Editors of the AMATEUR PHOTOGRAPHER, put through the lantern, and the proceedings closed with votes of thanks to Messrs. Hayhurst and Thomas, Mr. Severs, Messrs. Robinson and C. Bateson; and the Editors of the AMATEUR PHOTOGRAPHER, for loan of slides.

LIVERPOOL AM: PHOT: ASSOC:—The second ordinary meeting of the session was held on the 27th inst., when a number of candidates having been ballotted for, Mr. D. Lewis read a paper on "A Fortnight in the Netherlands with a Camera," and Mr. W. P. Christian one on "Moor and Don; or, Studies in Algeria and Spain." They were illustrated by the oxy-hydrogen light. On the 18th inst. a special lantern exhibition was given, under the auspices of this enterprising association, in the Lancashire and Yorkshire Station Buildings, Tithebarn Street, the large sale-room of which was well filled by a most attentive and appreciative audience. The entertainment, which was conducted by Mr. Paul Lange, the President, consisted of the display of some 180 lantern slides, embracing the whole of the gold, silver, and bronze medal winning sets in the *Photography* competition, lent by the editor of that journal. The views embraced some beautiful and artistically taken scenes from Norway, etc., in addition to highly-successful sunset and other views, most of which were much admired.

LOUTH AND DISTRICT PHOT: SOC:—A meeting was held in Mr. S. F. Clarke's drawing-room on Friday, Mr. J. W. East presiding; there were present Messrs. H. L. D. Marsden, E. Hall, J. J. Cresswell, C. James, and Mr. and Mrs. Clarke. Captain Smyth was unanimously invited to become the President. The election of other officers and the Committee was deferred until March 4th, Mr. Clarke undertaking to carry on the work of Hon. Secretary in the meantime. Beside those present the following gentlemen had signified their readiness to join the Society:—The Revs. Coates, Whistler and Everingham, Captains Ranshaw and Smyth, Messrs. A. Hall and A. Plaskett. The photographs shown in the AMATEUR PHOTOGRAPHER's competition were inspected, some capital pictures being included. That taking the head prize was a splendid seascape, reproduced with vivid realism. Mr. Clarke's prize photograph, "What Love Hangs by," was a charming group. The enthusiasm of Mr. and Mrs. Clarke is arousing lovers of the "black art" in the locality. The previous week, in a competition at Royton, Lancashire, Mr. Clarke took a bronze medal for photo-micrographs, in a scientific class open to amateurs and professionals.

NORTH LONDON PHOT: SOC:—The ordinary meeting was held on the 18th inst., under the presidency of Mr. Mackie. Some discussion took place on Tylar's Window shutter, and the opinion was expressed that such a shutter had a tendency to shake the camera. Various methods of making lantern slides were described, one member finding that parchment paper was a good diffuser of light. Mr. Traill Taylor said he had used recently Hughes' cantilever enlarging apparatus, the light being a paraffin light.

A discussion took place on the use of bichromate of potash as a reducer, in the course of which Mr. Taylor said that if plates had been exposed to light, immersion in a weak solution would restore them so that they could be used. The recent explosion of an oxygen bottle was referred to, and it was pointed out that if the heat of the gas had caused the incandescence of metallic particles in the bottle, that would not occur after the bottle left the works where it was cooled. The next meeting of the society at Myddelton Hall will be upon March 18th, the President, Traill Taylor, in the chair, when a demonstration will be given by the Britannia Works Company, on printing on alpha and bromide papers. Members are requested to notice that this demonstration is on March 18th, and not April 18th, as has been announced in error.

SCIENCE SCHOOLS PHOT. SOC. (SOUTH KENSINGTON).—The chair at the February meeting was taken by Mr. G. C. Rogers. After some discussion had taken place on improvements for the Society's dark-room, Mr. E. V. Clark read a paper on "Testing Photographic Lenses," of which the following is a short summary: In testing a lens it is necessary to pay particular attention to the purpose for which it is required, and also to remember that a subject may be chosen for a picture which will be better rendered by an inferior lens; for example, a lens with a spherical field would give a much better picture of a street with houses on either side than an acknowledged well-made lens. One of the first experiments to be tried is the determination of the focal length. This is done sufficiently accurately for most purposes by focusing a distant object, and measuring, in the case of a single lens, the distance between the screen and the lens, and in the case of a doublet, between the screen and the diaphragm slot. The visible defects in a lens are often the least troublesome; thus, bubbles in the glass, if near the edge, do not produce any interference worthy of consideration. A rather objectionable fault is the formation of an iridescent film on the surface of the lens, producing a scattering effect on the light. A blurred image may be due to the lens not being of homogeneous material, or to its not being properly ground. Whether a blurred image is produced may be tested by setting up a newspaper, vertical and square to the camera, focussing and exposing a plate, using a small stop. After development, the negative is examined with the aid of a magnifying glass to see if any local blurring other than gradually falling off in sharpness towards the edges is noticeable. A fault known as a flare spot is detected when present by taking a photograph of a bright scene, using a small stop, and looking for a fogged appearance opposite the centre of the lens. The following will serve as a means of finding the presence of a ghost image: Focus on the screen the image of a candle flame, and, covering the head with the cloth, move the camera slowly round, and watch for an image moving in the opposite direction to the real image. If present, it will be direct and faint; in short, a ghost image, which, if not already in focus, may be readily focussed. A fault which if not detected will prove very troublesome, is the non-coincidence of the chemical and visible images. To detect this, place about five cards behind and above one another. At a distance from the cards of forty times the distance between two consecutive cards, the camera is placed and focussed on the middle card. A plate is then exposed, developed, and examined to see if any card is clearer than the one which was focussed. In place of the usual focusing screen an old plate in the slide should be used, both shutters being drawn, and focussing being done on a scratch on the side of the glass facing the lens. It is as well to know the covering power of the lens, since some half-plate lenses will cover whole-plate, and others only quarter. This is conveniently done by fixing the lens in the front of a camera larger than that for which it is required, and an image of a watch face is focussed on the screen; the covering power is given by the distance on both sides from the centre that an image can be formed. Astigmatism may be looked for at the same time, comparing the fine strokes of the X in 12 and 9, this fault being the inability to focus vertical and horizontal lines at the same time. If a lens is correctly centred, on getting the images of a candle flame produced by the lens superimposed, on rotating the lens they should remain so. The flatness of the field is readily ascertained by focussing a newspaper at the centre of the plate or screen, making a mark on the baseboard, and racking out till the edges are in focus, again marking the boards; the distance between the two marks gives an indication of the curvature or flatness of the field.

SWANSEA AM. PHOT. ASSOC.—Nearly 200 persons assembled at the Albert Minor Hall on January 31st, at the second public lantern evening of the above Association. The first part of the exhibition consisted of river and mountain scenes, instantaneous and figure studies, which were kindly lent by the "AMATEUR PHOTOGRAPHER." The second part consisted of local views by members of the Swansea Association, the principal of which were Maegain Abbey, the falls in Vale of Neath, Penllergare, and Llandilo. The members were very much encouraged to find that their own slides were quite equal to, and in a few cases better than the borrowed ones. Judging by the attendance at these exhibitions and the applause which greets the best pictures, they are greatly enjoyed not only by photographers, but by the general public. Mr. Webber manipulated the lantern.

WALLASEY PHOT. ASSOC.—The ordinary monthly meeting was held on the 5th inst., the Vice-President (Mr. E. Kite) in the chair. Mr. W. Priestley was elected a member of the association. The room has been decorated with framed pictures, the competitive and other prints, work of the members. Several exhibits were passed round—a "Thornton-Pickard" shutter by Mr. Gregg; Mr. Sharp showing an improved roll-holder for the new flexible film, as well as a "Swinden and Earp" hand-camera holding and changing automatically twenty plates. This camera obtained the medal awarded by the Photographic Society of Great Britain. Mr. Gregg exhibited some fine specimens of his work on bromide paper, which showed its keeping powers; the paper, although it had been in stock many months, giving beautiful prints. Mr. Wilkinson showed specimens of his work on the new roller film. Mr. Frank Vaughan gave a very able demonstration on photo-zincography, treating of the processes used in transferring a picture from the gelatine plate on to the block used for printing from. He gave examples of work in all its stages, starting from the drawing, which is photographed by the wet-plate process. A zinc-plate is then taken sensitised with a solution of albumen and bichromate of potash and exposed under the negative, making all parts through which the light cannot get insoluble; the plate is then rolled with the transfer ink and developed, leaving the lines of the original drawing in transfer ink on the zinc plate; the other portion of the plate is submitted to an acid bath, the lines being left in relief and ready for the printing press. The paper was very interesting throughout, and a hearty vote of thanks was passed to Mr. Vaughan. The next meeting will be held on the 5th prox., when Mr. H. Wilkinson will give a paper on "Clouds and Cloud Negatives." A discussion will also take place on "Detective Cameras," several descriptions being shown.

WEST LONDON PHOT. SOC.—An ordinary meeting of the above Society was held at the Addison Hall, on the 14th inst., Dr. F. H. Low, M.B., presiding, through the unavoidable absence from ill-health of the President. The members were informed that Mr. Wilson intended presenting the Club with a selection of photographic works for the library. After questions from the box had been put and answered, and the discussion thereon, and the election of new members and other formal business gone through, Mr. Ronald Whiting read his paper on "Reducing and Intensifying Negatives." In the discussion which ensued, Mr. C. Whiting remarked that negatives dried quickly through immersing in spirit to drive the water off are generally much denser than those dried in the ordinary way. In fact, a negative that was dry in some parts and not in others, on being put into the spirit and dried was found to be almost twice as dense in those parts that were not dry on immersing in the spirit. He also mentioned that if a very much under-exposed negative were simply bleached with mercury, and then allowed to go, it would be decidedly improved, and although the contrasts before were too violent, the bleaching would remedy that to a large extent. Mr. Blackmore said he did not approve of intensifying a badly under-exposed negative. It had its proper place, which was certainly not in the printing frame. Mr. R. Whiting, in replying to questions, remarked that the different processes of intensification enumerated could be used with films, and he did not think there would be found to be any action on the celluloid backing. The Chairman requested the members who had won medals at the late exhibition to send them to the Secretary, as they were to be engraved with names and dates; and announced that a special general meeting would be held on the 8th of March, to consider the exhibition, and generally discuss all matters relating thereto, except that the question of the awards must not be touched upon in the sense of questioning any of them. A

vote of thanks to Mr. R. Whiting for his paper, and to the Chairman for presiding, terminated the proceedings. Members will note that the meeting of the 8th of March is not to interfere with the holding of the next ordinary meeting on the 28th inst.

WOLVERHAMPTON AM. PHOT. SOC.—A most interesting and instructive lecture was given in the Assembly Room, Agricultural Hall, on February 21st, by a prominent member of the Birmingham Photographic Society, entitled "Through Western Norway with a Camera." Councillor T. Ironmonger, the Society's President, occupied the chair, and there was a capital attendance. The Chairman, in introducing the lecturer, said the whole of the views, which numbered from 150 to 200, were the result of the lecturer's own handiwork. The lecturer expressed his desire to

make the entertainment as realistic as possible, and he therefore put a map on the canvas (13 feet square), pointing out the route, which was *via* Birmingham and Hull to Western Norway. The starting point was Queen Square, Wolverhampton. Some moonlight sea scenes *en route*, with unsurpassable cloud and reflective effects were enjoyed, and on landing, the party were shown a collection of interesting views that would occupy too much space to explain in detail. The lecture should certainly infuse new fire into the minds of all those who were in attendance, and Mr. J. W. Evans, the Hon. Sec. of the Wolverhampton Amateur Photographic Society, is worthy the thanks of its members for the introduction of such an able and successful experimentalist. Votes of thanks terminated the proceedings.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editors, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S** post.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3503. **Toning.**—Will anyone kindly give me the exact formula for toning with chloride gold and neutral oxalate of potash?—**BORDEN.**
3504. **Alpha Lantern Plates.**—Will anyone who has worked these plates kindly tell me if it is possible to get black tones or anything approaching that? also can green tones be got with them, and if so, how? With thanks in advance.—**CYCLOS.**
3505. **Astronomical Lantern Slides.**—Will any of your readers kindly inform me where I would be likely to obtain, on reliability, an "astronomical set" of lantern slides, and "book matter" to accompany, together with probable cost of such?—**FRATER.**
3506. **Jersey.**—I intend spending a week or two of March in Jersey, and also intend (if possible) taking my camera; will anyone inform me whether on my arrival at Weymouth I shall have to open my boxes of dry plates, or whether they have a dark-room provided, the same as they have in the London Docks? If this is not the case, are the Customs provided with the necessary room at Plymouth?—**AN OBSERVER.**
3507. **Dry Powder Developer.**—I should feel indebted if anyone that has used the dry powder developer would give me an opinion about it. I should also like to know how long time it will keep, and how it must be kept in order to always be ready and fresh for use? Can instantaneous pictures be developed with it?—**A. T. J.**
3508. **Developer.**—Wanted a concentrated hydroquinone developer, two or three solutions, for travelling.—**WANDERER.**
3509. **Thomas's Plates.**—Please say the best means of judging the exposure of Thomas's extra rapid plates (R.R. lens)?—**PHOTO.**
3510. **Stops.**—I have a 5 by 4 camera, and cannot find out the number of my stops; the lens is 6 in. focus; will some one kindly tell me how to number them?—**ABORIGINAL.**
3511. **Clearing Bath.**—Will some one kindly tell me a good clearing bath for bromide paper? I always have a yellow tinge in my prints. I develop by hydroquinone.—**ABORIGINAL.**
3512. **Time Shutter.**—Will any amateur kindly tell me if they know of any reliable automatic time-shutter, so that by turning a screw I could obtain any exposure from say $\frac{1}{4}$ second to about 20 or

30 seconds, or less. The lens must be open practically the whole of the time. Information of any such shutter, with price and where to be obtained, would greatly oblige.—**J. F. ONILD.**

3513. **Hand Camera.**—Would any reader of the **AMATEUR PHOTOGRAPHER** kindly recommend a hand camera to take 5 by 4 pictures (plates). By doing so it would greatly oblige.—**FRANK RASENAL.**

3514. **Detective Camera. How to Make.**—Will any of the kind readers of the **AMATEUR PHOTOGRAPHER** tell me a good and simple way to make a detective camera, one to hold twelve plates, $\frac{3}{4}$ by $\frac{1}{4}$, giving me full dimensions and particulars as to construction of same. I have an Optimus 7 by 5 rapid rectilinear lens; please say whether I shall be able to use same at a fixed focus.—**L. M. P.**

3515. **Trafalgar Plates, etc.**—Will any amateur who has used Wood's, or Cheapside, "Trafalgar" plates, and Wood's hydroquinone developer, give me his opinion of them; are they as good as any of the other cheap plates? Also his opinion of Wood's sensitised paper, and if the acetate toning bath is the best for same?—**BEGINNER.**

3516. **Lancaster's Instantograph.**—Will any amateur give me his opinion of Lancaster's quarter-plate Instantograph? Is the lens a good one? and is the camera strong and well made? Does the shutter vibrate camera? Is it better to buy the International camera than the Instantograph? Are Underwood's goods any better than Lancaster's?—**BEGINNER.**

3517. **Thistleton's Hand Camera.**—Would Mr. Dresser kindly say where Thistleton's hand camera is to be seen or obtained? Also his own, if in the market?—**C. S. T.**

3518. **Photographs of Trains.**—Will any reader kindly inform me where I can get instantaneous photographs of express trains, the G.N. and L.N.W. Scotch expresses in particular.—**G. H. T.** (address with Editors.)

3519. **Toning Lantern Slides.**—Will some kind reader give the best method of toning lantern slides to a rich bluish purple? Should the slide be toned before, during, or after fixing? I develop with Thomas's hydroquinone.—**CARLSBAE.**

3520. **Lens for 5 by 4 Hand Camera.**—I want to make a 5 by 4 hand camera; is there any lens which will cover a plate that size, and working as a fixed focus lens will give all objects in focus at 12 feet or thereabouts? All the lenses that I can find advertised seem to be of so long a focal length that objects would not be in focus under 30 feet, or thereabouts.—**ASHTON.**

3521. **Lancaster's Silver Ring Rapid Rectilinear Lens.**—Can some one kindly inform me if this is a reliable instrument; also if Lancaster's lenses are made to a gauge, so as to be interchangeable?—**SANTOS.**

3522. **Copying.**—I want to copy some photographs and drawings; how long should I expose?—**COPYING.**

3523. **Action of Fire Light.**—Is fire light likely to fog plates? I screen the fire, but there is white light reflected from the ceiling.—**LLANBERIS.**

3524. **Euryscope.**—Will some reader who possesses an 8 by 5 Optimus R. Euryscope answer me the following, and oblige? What are its covering powers at $f/6$, $f/8$, and $f/16$? Has it as great depth of focus as a R.R.? Has it any advantages or disadvantages as compared with a R.R.?—**R. A. KADELBACH.**

3525. **Elimination of Hypo.**—Can you tell me if the following, which I discovered in a book, is a good method? For removing hypo after being in fixing bath, the prints are immersed in a saturated solution of alum for two or three minutes, then washed in several changes of water for five or ten minutes, when they are finished.—**HYPO.**

QUERIES UNANSWERED.

31st.—Nos. 3410, 3414.
Feb. 7th.—Nos. 3417, 3422, 3430, 3435.
14th.—Nos. 3437, 3441, 3452, 3454, 3456, 3457,

- 21st.—Nos. 3462, 3464, 3465, 3466, 3468, 3469, 3471, 3472, 3473, 3476, 3477, 3478, 3479, 3484, 3485, 3487, 3489, 3490, 3491, 3493, 3494, 3495, 3499, 3500, 3501.

ANSWERS.

3354. **Honeycomb Frilling.**—The plates were possibly stale, or you left them too long in the fixing bath.—**E. J. FEILDEN.**

3459. **Fancy Bazaar.**—No.—**E. J. FEILDEN.**

3359. **Fancy Bazaar.**—Selling photographs at a bazaar for church restoration fund, provided you made no profit on the sale, could not disqualify you from taking part in amateur competitions. Read the recent articles and correspondence on the "Amateur Question."—**THE SMITH.**

3354. **Pizzighelli Paper Staining Plate.**—If your negatives are stained from the platina paper, you may consider the case hopeless. If only pitted by the rain-drops, a ten minutes' soaking in water, and the flooding them in methylated spirit, will improve them.—**E. J. FEILDEN.**

3370. **Condenser.**—Your query has been answered by the correspondence. What you ask is not a difficult performance, but it is not good at its best.—**E. J. FEILDEN.**

3371. **Covering Power of Lens.**—If the lens be only 2 ft. from the sitter the resultant portrait would be fearfully distorted. Shorten the camera, and take a smaller picture. A 2 in. head should not be taken with a lens of less than 12 ins. focus.—**TAM SMITH.**

3375. **Model Camera.**—The camera you mention is sold, I believe, by J. Braine, 22, Bedford Terrace, Andover Road, N.—**THE SMITH.**

3376. **Magnifying Lantern Slides.**—I cannot give the address asked for, but a somewhat similar apparatus for the same purpose is sold by Mr. Tyler, Aston, Birmingham.—**THE SMITH.**

3373. **Depth of Focus.**—Make a paper or cardboard tube of the same diameter (inside) as your lens, and about half as long again, and blacken it inside. The lens should be fixed in one end by means of narrow strips of thin cork glued on inside, and then the tube be wrapped with soft, thick blotting paper until it will fit a flange in your camera front. Black cardboard stops may be made to fit the other end of the tube, and the image can then be studied on the ground-glass with any aperture you wish.—**THE SMITH.**

3379. **Fallowfield's Facile Camera.**—The issue of February 21st contains numerous replies to a query similar to yours.—**E. J. FEILDEN.**

3383. **Focus.**—By taking out the back combination of the longer focus lens, and slightly separating the components, the focus will be shortened at the expense of a little definition, which may be remedied by stopping down.—**THE SMITH.**

3385. **Dust on Negative.**—I imagine it is the reflected light from the dust particles flying about the room, or else your plates have been kept in an impure or damp place. Try the magnesium flash-light.—**E. J. FEILDEN.**

3389. **Burnishing.**—You will require a burnisher. After your prints are mounted apply Castile soap, 5 grs. to the ounce of methylated spirit (*vide* "Dictionary of Photography"), allow them to dry, and then pass through the burnisher.—**E. J. FEILDEN.**

3393. **Lantern Jet.**—Perken, Son, and Rayment, Hatton Garden, E.C.—**E. J. FEILDEN.**

3401. **Taking Houses, etc.**—You cannot possibly go close to a building and take the ground and roof at the same time. The size of the building and the ground behind you must be your guide.—**E. J. FEILDEN.**

3401. **Taking Houses, etc.**—Try taking the views from a more distant point, and if you must tilt your camera, you also must use the swing-back to bring the plate exactly vertical. You would probably do better work with an ordinary rapid rectilinear lens.—**THE SMITH.**

3403. **Lens.**—The larger the lens the greater the angle of view.—**E. J. FEILDEN.**

3403. **Lens.**—In a general way, yes. A lens of 5 in. focus will take the same angle on a quarter-plate as a lens of 10 ins. on a full plate.—**THE SMITH.**

3405. **View Meter.**—The measurements are as follows:—Fig. 1., slot, 1 in.; aperture, $2\frac{1}{2}$ by $1\frac{1}{2}$; outside, $3\frac{1}{2}$ by 3. Fig. 2, 7 ins. by 1 in. Fig. 3, $1\frac{1}{2}$ in. by 1 in. Diameter of outer circle, $\frac{1}{4}$ in.; inner ditto, $\frac{1}{8}$ in.—THE SMITH.

3406. **Lantern Slides.**—A matter of taste—but the pyro developer is the most difficult, in my hands, to get good results from.—E. J. FEILDEN.

3406. **Lantern Slides.**—Hydroquinone is the best all round, and if you use either the Thomas or Ilford formula you cannot fail to get good results with reasonable care.—THE SMITH.

3409. **Intensifying Negatives.**—Soak the negative first. Use sulphite of soda instead of ammonia.—E. J. FEILDEN.

3412. **Enlarging.**—The "Clamond" incandescent burner would probably suit you. The heat is considerable, but it is the most powerful gas light I have seen.—THE SMITH.

3421. **Background.**—The effect you mention is obtained by a graduated background, or by using a neutral-tinted one and vignetting.—THE SMITH.

3421. **Background.**—What sort do you want? Second part of question. What do you mean?—E. J. FEILDEN.

3429. **Cistern for Dark-Room.**—No; but it is better to paint the inside of can with Brunswick black.—E. J. FEILDEN.

3431. **Ventilation of Dark-Room.**—If the querist will write me I will send a sketch.—THE SMITH (address with Editors).

3431. **Ventilation of Dark-Room.**—It is almost impossible to answer your query without a ground-plan of the room, and knowing how much you care to spend.—E. J. FEILDEN.

3434. **Fixing Prints.**—Just sufficient to cover it. In a straight-edge half-plate dish, 2 ozs.—E. J. FEILDEN.

3438. **Aristotype.**—What do you mean?—E. J. FEILDEN.

3440. **Set of Apparatus.**—If H. C. Durnford gets a quarter or half plate Instantograph, he will find he has something serviceable and a credit to him. Cheap sets which are advertised are no use. Respecting Lo. ker's hydroquinone developer, as a beginner he cannot do better; I have used it sometime; although in one solution, it is capable of sufficient adaptation to meet the extremes of over and under exposure; see instructions on bottle. It is equally good for developing bromide paper, transparencies, and lantern slides. It gives good black and white negatives. If "H. C. D." will write to me I shall be able to give him more particulars respecting both.—W. DREW (address with Editors).

3445. **Opals.**—If you mean print-out opals, it is advisable to have a special frame. They are printed and toned in the same manner as albumenized paper. The plates may be obtained from most of the best plate-makers.—E. J. FEILDEN.

3449. **Granularity in Emulsions** is caused by adding the silver nitrate too quickly and in too strong a solution. 60 grs. of silver nitrate to 1 oz. of water is about the right strength the solution should be. Add in portions, and shake well each time. A better result may be obtained by adding 20 minims of dilute hydrochloric acid (1 of acid in 100 water) to each pint of emulsion. If both of the above directions are followed, a finer precipitate cannot be obtained. I don't think it is possible to cure the granularity, and should advise Mr. Woodland to recover the silver from any emulsion that he cannot use.—J. F. CHILD.

3451. **Lantern Slides.**—The respective distances of negative and plate will be 38 ins. and 12 ins. (approximate), which will reduce to one-third size.—THE SMITH.

3453. **Bromide Papers.**—There seems to me only one way of filling up your bottles, and that is to make more of the solutions. If you have lost the formula, why not say so? I will send you the detail if you require them.—E. J. FEILDEN (address with Editors).

3458. **Water.**—"Ordinance" may obtain practically pure (aerated) water from all waters hardened by bicarbonate of lime, by boiling and filtering through a fresh ball carbon filter. As soon as the water begins to lose its fresh taste, after filtration, the ball will require to be rebaked, which the maker will do for a small charge. "Ordinance" can test whether his water is hardened by bicarbonate of calcium or not by adding a little clear lime water to some of the cistern water, and if any milkiness is produced, bicarbonate of lime is present. The boiling will free all such water of the lime, and the filtering will aerate it again. I should not advise any chemical methods, as they require the experience of a practical chemist.—J. F. CHILD.

3461. **Camera and Set.**—I would recommend "Luder" to get "Underwood's Instanto," which is sent out with lens, tripod, and time and instantaneous shutter. It is made square with reversing back, and is very compact. Price, half-plate, £1 4s., from Messrs. E. and T. Underwood, Granville Street, Birmingham.—SICILIAN.

3463. **Enlarging Apparatus.**—I should advise you to make the one described on page 119 of the "Year Book" for 1890. I have found it to be very cheap, and to answer the purpose very well. It is for enlarging by daylight.—DRY-PLATE.

3467. **Hand Camera.**—For most ordinary subjects one-fifth to one-twenty fifth of a second is quite quick enough for hand-camera exposures, and even

flower than this will give good results in some cases. I should not advise the use of Barnes's slides; each one only holds one plate, consequently to carry many plates means great bulk. Why not try the mahogany double dark slides made by Talbot and Eamer, Blackburn? They make special slides for detect eye cameras, which are very compact and light-tight.—OXIDE.

3470. **Bottles.**—Shake up a little concentrated nitric acid in the bottle until the grey deposit disappears, and then thoroughly wash with water.—SICILIAN.

3470. **Bottles.**—Try strong nitric acid for the nitrate of silver bottles.—J. F. CHILD.

3474. **Duty on Plates into Switzerland** is considerable; but I have before me a price list issued by E. Baud, 11, Rue Verdaine, Geneva, where half-plates are quoted 3-20 frs. "Ferrier-Kerr" is being imposed on, and I should advise him to write at once to Mr. Baud.—J. H.

3475. **Obenetter Paper.**—First time I have heard of Obenetter "Aristotype" paper. The formula you give is something like that published by Liesegang, but the quantities you give are altogether out of proportion. For printing-out I use Liesegang's "Aristotype" paper only, and I use a combined bath for toning and fixing, which I append, which I find gives me excellent results:—

A.				
Water	...	...	...	12 ozs.
Hypo	...	...	...	2 "
A. um	...	...	...	2 drms.
Sulphocyanide ammonium	...	...	...	1 drm.
Common salt	...	...	...	4 drms.
(Let solution stand for at least eight days, and then filter.)				

B.				
Water	...	...	...	3 ozs.
Chloride gold	...	...	...	15 grs.

Mix A, 60 parts; B, 7 parts; and add 40 parts old combined bath. For new bath I use A, 80 parts; B, 7 parts.—THE LONG 'UN.

3480. **Toning Formula.**—Please mention what kind of paper you intend using, then perhaps I may be able to assist you.—THE LONG 'UN.

3481. **Willesden Paper** and all substances in straw board, up to one-eighth of an inch thick and very cheap, of Mr. E. G. Platt, 38, Alvington Crescent, Dalston, London, N.E.—L. STRINGER.

3482. **Amateur, What may he Do.**—(1) The Editorial reply answers this. (2 and 3) At present seem matters of conscience.—E. J. FEILDEN.

3483. **Lantern Slides.**—Hepworth's "Book of the Lantern."—E. J. FEILDEN.

3483. **Lantern Slides.**—I should advise you to get Hepworth's "Book of the Lantern."—THE LONG 'UN.

3485. **Enlarging by Lantern.**—No.—E. J. FEILDEN.

3488. **Solutions.**—I should not think "G. B." would find a plain 10 per cent. solution of pyro to keep well. A developer containing potash metabisulphite as a preservative may be made by dissolving 1 avoirdupois ounce of that salt in about 6 ozs. of water, then 1 oz. of pyro, and making the solution up with water to 9 ozs. 1 drm. This will represent a nearly exact 10 per cent. solution. I have used this with Ilford's, and prefer it to any other preservative. The 10 per cent. solution of bromide is made by dissolving 1 oz. of potassium bromide in some water, and making up to 9 ozs. 1 drm. Ammonia solution likewise made by adding 1 oz. liquid ammonia to 9 ozs. of water. For Ilford's take 20 minims pyro, 25 minims bromide, 40 minims ammonia to each ounce of developer. Captain Abney, in his "Instruction in Photography," gives some formulae for dry plates, using 10 per cent. solutions.—SICILIAN.

3488. **Solutions.**—Metabisulphite of potash is not recommended as a preservative. I copy following from *Photo Scraps* of Oct. 1st:—"We have been asked to give a formula for our pyro developer in terms of 10 per cent. solutions:

(P.)				
Pyro	...	...	...	1 oz.
Water, distilled	...	...	...	to 10 ozs.
Add 20 drops nitric acid.				
(B.)				
Bromide ammonium	...	...	...	1 oz.
Water	...	...	...	to 10 ozs.
(A.)				
Ammonia, '830	...	...	...	1 oz.
Water	...	...	...	to 10 ozs.

These will all keep in stoppered bottles. To develop a half-plate correctly exposed, take P, 37 minims; B, 50 minims; A, 90 minims, and add water to make 2 ozs. of solution.—J. H.

3492. **Test Papers.**—"G. B." will find all he requires in any text-book of chemistry. Look for litmus and turmeric papers; they are the only ones likely to be required in photography.—J. F. CHILD.

3495. **Enamelling Prints.**—I have never failed in enamelling prints. I will give you an outline of my process. I obtain a sheet of glass, say about 2 ft. by 1 ft., and clean the best side with a wet leather which has been dipped into some powdered whiting. The whiting which has been left on the glass must be allowed to dry, and then polished off with a clean dry duster. A piece of cotton wool is dipped into some French chalk, and rubbed all over the glass, then with a fresh piece of wool it is dusted till none

of the powder is visible. The prints, if dry, are soaked for a minute or two in clean cold water, and laid face downwards upon the glass. The moisture is removed with a sheet of blotting paper, and each print is gone over separately with the squeegee, great care being taken that all bubbles are removed. The blotting paper is again applied, and the prints are put aside for several hours to dry.—THE LONG 'UN.

3497. **Unmounting Prints.**—Perhaps the following will suit "H. Y." I have always taken off any prints from mounts by putting a piece of wet clean blotting paper a quarter of an inch larger than the print on it, and allowing it to soak for some hours, when, on raising a corner of the print carefully, it will separate from the mount, which can then be wiped with a wet cloth and put under a weight to dry, when it can be used again.—J. H.

3497. **Unmounting Prints.**—So long as the stereo views are not printed on a gelatine paper they can be removed from the mount by soaking in moderately warm water.—SICILIAN.

3498. **Cloth for Shutter.**—Mr. Platt, 38, Alvington Crescent, N.E., can supply cloth for shutters, and in fact there is nothing but what I think he can supply you with.—L. STRINGER.

3501. **Stereoscopic Photography.**—(1) Thornton's (Manchester) Shutter, the usual Kershaw pattern, is made for stereo cameras, and works very well; price about 20s. (2) Books on stereoscopic. The only one I know of dealing specially with stereoscopic work is more a scientific text book, published by Murray, title, "The Stereoscopic: its History, Theory, and Construction," by Sir D. Brewster. In the "British Journal Almanac," 1887 issue, (by J. Traill Taylor) a first-class article on production of stereo negatives and transparencies appeared. Also in seven numbers of 1888 issue (by Wm. Chadwick) of the *Journal* you will see it as well, and find the same most valuable. I often myself wish Mr. Hepworth would give the public an exhaustive and plain handbook, a companion volume to his excellent lantern one.—T. S. MAYNE.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM. PHOT.

A. COOTE.—All the pints will be returned in about a week.

GEO. COYNNORS (Tralee).—Our publishers are sending you a specimen copy. We cannot advise you about your son. You can procure good apparatus through the AMATEUR PHOTOGRAPHER'S "Sale and Exchange" column. We publish a "Dictionary of Photography"; see advertisements. "Modern Photography" and "Photography for All" are very useful books. Your son would get on much better if he got someone to give him a few lessons.

P. R. SALMON.—The articles and chemicals are not very costly, and it is not worth risking a failure by using them. 1. Depends entirely if they are packed well. It is always best to use plates that have not been long in stock. 2. This might be all right. 3. Is probably very much reduced in strength. 4 and 5. Cannot advise you as to the keeping qualities. 6. Throw it away. The developers Nos. 1, 2, and 3 we should experiment with.

E. H. FITCH.—The specimens came safely to hand, and are noticed herein. The business part of the letter will be handed to our publishers.

LEWIS M. BIDEN.—Very sorry your Sale and Exchange advertisement was mislaid last week. It is now inserted.

YENDYS.—We certainly do not consider a chemist who sells photographic apparatus or chemicals a professional photographer.

DETECTIVE.—No. 1. There is a view finder in the camera you name, and a very simple shutter. Do not understand your reference to "two lenses." No. 2 is by far the best finished camera, and the lens you name a very much better instrument than the usual form.

REV. H. J. SIBTHORP.—We have lost track of your query; the second shutter you name in letter is the best. We have set aside Tuesday afternoons on purpose to assist and advise our subscribers. We will answer any questions through this column, provided they comply with our rule, but we cannot undertake to answer and advise by post.

W. H. A.—Why don't you use the developer given by the maker in every box of plates they send out? They certainly know which is best developer for their own plates, and the best is always the cheapest.

W. H. BANKS.—We cannot say positively, but are almost certain that the manufacture of both brands of plates has ceased.

GYLIST.—It is against our rule to advise by letter, but you can forward a list of cameras, etc. with numbers for identification, and we will tell you through this column which of them we think most likely to suit your purpose. You send us a very poor print and no particulars as to lens and plate used, exposure, etc.; send us these, and we will try and help you.

S. E. PHILLIPS.—We are unable to trace any "cottage drawings."

W. M.—We never heard of the maker you give as No. 1. No. 2 are makers, and the lens a thoroughly first-class instrument.

GEO. F. FAITH.—We suppose your prints were not suitable for reproduction. Of course it is quite impossible to reproduce every photograph.

W. K. BURTON (Tokio).—Report received and commented upon in another column.

J. T.—Excellent work is done with the camera and set you name. We have also every confidence that you would be well pleased with x.

W. H. KIRK.—We have never used or seen the camera you name, and cannot, therefore, say if a slides will fit it, but they are very serviceable. You should be able to do very good work with 3 plates.

SAUMUR.—The Exhibition opens on the 11th of March, and will remain open at least a fortnight.

BUSTACE PINKERTON.—In answer to No. 1, we have not had sufficient experience of the camera to support all the makers say of its good qualities. For ourselves we prefer the second camera you name in No. 2 query, and know that you can enlarge from the negatives up to 12 by 10.

PYRO-TYRO.—We know nothing of the man, and have stopped his advertisement in "Sale and Exchange" column; his letter is returned. The lens A is a cheap and good lens, and so is B. We have not worked with C, D, E, or F. We suppose the "removable hood" is really a sun screen.

A. R. BANNIS (Rangoon).—We thank you very much for the letter, which we shall certainly make use of.

E. SMITH (Nottingham).—Our readers are much indebted to you, and we thank you on their behalf and our own.

E. F. S.—The A plate is certainly richer in silver than B. We should prefer the C lens; it is, in our opinion, a better lens than D.

P. T.—We were very pleased with No. 2. We do not understand your second query. Do you mean "back focus" or "equivalent focus"?

DRY PLATE.—Write to the Secretary, Mr. George Breathing, Church Street, Egremont, Cheshire.

D. E. GODDARD.—When you are better, perhaps you will send us a contribution on ferrous oxalate.

W. FLETCHER.—Prints will be returned probably next week.

BUSTACE CALLAND.—Certainly, send the camera.

W. I. CHADWICK.—Many thanks for your courteous letter and explanation. You will remember to have sent us a letter as to the benefit of our stereoscopic slide competitions had been in reviving stereography.

R. SHAW.—We are still waiting instructions.

R. W. BUTTNER.—We shall be delighted to see some of your work, and will do our best to criticise the same. About "Postal Photographic Club," we cannot help you with rules, but should advise you to write us a letter for publication, as several such clubs exist. The other idea looks good.

W. EYDMANN, Junr.—No. 3 first, and No. 1 second.

E. NORTHCOTT.—Our publishers will communicate with you.

JOHN H. MONTAGUE.—Yours, if you did not follow out their instructions. If you did, it is theirs, and we should send the lamp back, and ask for a new one. We will compare your letter with Mr. Gordon's.

BORROWDALE JEWS.—In back numbers of the AMATEUR PHOTOGRAPHER you will find many such articles as you require under the heading "Holiday Resorts," and no doubt we shall continue them during the summer season. It is kind of you to send us the suggestion.

LESLIE BAKER.—Your answer is an advertisement, and should appear in Sale and Exchange Column, "three words a penny," but we have sent on your letter to our querist.

STRADIVARI.—Afraid we cannot help you much, but should advise you to use a plate rich in silver, stop down your lens, and give a long exposure in a good light. Let us know how you get on. Thanks for letter, which we publish.

J. TAYLOR.—We do not think the picture was taken in a stereoscopic camera; it is greatly over-exposed, plate probably badly fogged, and the picture generally is, in our opinion, most inartistic. We will keep the print as a specimen.

R. F. FEILDEN.—Your letter is published. With most of it we agree, and shall like to hear what others say. Put your initials; quite sufficient. Many thanks.

SANTOS.—We should buy No. 2. It is a good lens, and why pay 7s. more for the other?

CARLEAD.—Certainly, we can "honestly recommend the camera." We should say, have the higher priced lens.

CHARLES W. TOWNSEND.—In answer to 1, never use a dirty developer; it is not worth risking your negative. 2. You must only expose undeveloped negatives to red or yellow light.

R. W. S.—Certainly we will, if sent to us; please let the drawing be clear, a line drawing will be sufficient, not shaded. Glad to hear that your other idea was taken up.

R. A. HADELBACH.—The lens you have been using is a well-known portrait lens, and, as a rule,

capable of excellent work. We should think the lens was quite worth "stops." You might get them made by a smart brass-finisher; give the diameter. We should advise you to have No. 1, or you might do excellent work with No. 1 R.R. At the moment can't say whether we had portrait in Home Portraiture Competition taken with the make of lens you mention.

LLANBERIS.—Only one. As many figures as are necessary for the arrangement of your picture.

J. E. P.—"Carrickfergus Pier" is the best. Have you not touched up the high lights? It is to be regretted that you had to cut off part of the stern of the vessel and the tip of her mainmast. There is no particular fault to be found with the technique.

"Country Lane" has no merit as a picture, and very little as a photograph. Your negative is probably very thin. We should advise using larger mounts; a wide margin much assists the picture. Be careful that you get on your plate all that goes to make up a picture, and do not be impatient—the composition of a picture depends greatly upon patience.

ALPERUM.—Very many thanks for extract; we will call attention to it.

Prize Tour Competition.

In the above competition we have received the following entries:—

W. McLean Forbes	...	New South Wales
Miss Griffith	...	Littlethorpe
W. W. Whittard	...	Cheltenham
R. J. Shields	...	Mexboro
W. L. Howe	...	Beckles
W. B. Windeles	...	Long Ditton
Mrs. Co'e	...	Lewes
J. T. Black	...	Corstorphine
F. Anyon	...	Liverpool
A. G. E. Newland	...	Upper Burmah
L. W. Tindal	...	Newton Abbott
Lumley Cator	...	London
Capt. Brotherton	...	Cullercoats
R. Tindall	...	Leighton Buzzard
G. E. Galbraith	...	Stirling
F. G. Smart, M.A.	...	Tunbridge Wells.
W. H. Scott	...	Bradford
H. Day	...	Tonbridge
H. Holt	...	Southport
H. E. Allen	...	Nottingham
E. T. Zimmer	...	Anerley, S.E.
C. J. Jackson	...	St. Andrews, N.B.
J. C. Livingstone	...	Edinburgh
M. O. Forster	...	Clapham, S.W.
Paul Lange	...	Liverpool
S. H. Barton	...	London, W.

Sale and Exchange.

RULES.—Four pence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or we do counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Sale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

"Amateur Photographer," vols. vii., viii., ix., x, AMATEUR PHOTOGRAPHER, with indexes, unbound; what offers, cash, or photographic apparatus?—23, Carisbrooke Road, Walthamstow, N.E.

AMATEUR PHOTOGRAPHER, 133 numbers to date; also Photography, 64 numbers, clean, unbound; exchange, background, paper or other, or 9s. cash.—Sears, 7, Northrop Street, Grosvenor Square, W.

Vols. vii., viii., and ix. of AMATEUR PHOTOGRAPHER, unbound, best offer; Optimum view finder, cost 2s. 6d.; price 2s. 6d.; Veve's dropping tube, flash-lamp, and magnesium powder, 1s. 6d.—F. P. Heath, Strickland Place, Kendal.

Apparatus.—Declining photography. Following for disposal: McKellen's 6½ by 4½ camera, 4 backs, all extras, and tripod, cost £15, take £10; Thornton's tourist 6½ by 4½ camera, 3 backs, tripod, etc., cost £3, take £2; Middlemiss's 8½ by 6½ camera, 3 backs, £5; Sands and Hunter 5 by 4 camera, cost £7, take £1; Marion's miniature camera, cost £4, take £2; Stirn secret camera, cost 35s., take 20s.; Ross's 6 by 5 R.S.,

75s. (new), Laverne's 8 by 5 R.R., cost £5, take £3; 10 by 8 R.R., £5; Optimus 7 by 5 R.R., 35s.; cabinet lens, cost £14, take £7; C.D.V., cost £4, take £2; Rouch's tent, cost £7, take £3; burnisher, cost 43s., take 30s.; backgrounds, head rest, furniture, frames, dishes, plates, etc.; list sent, state wants, all articles perfect and nearly new, week's approval, exchange entertained.—Photo, 21, Wakefield Road, Dewsbury.

Camera.—Rouch's Eureka detective, in case, nearly new, cost £7; price £1 10s.—Ellis, 7, Park Village West, N.W., where it can be seen.

Half-plate camera, by Lancaster, 1889 patent, reversible back, double slide, nearly new, has given splendid results; £2 14s.—P. Galley, Fern House, Murchison Road, Leyton, Essex.

Lancaster's quarter-plate Merveilleux camera, nearly new, with dark-slide; price 12s.—Vicar, Rushall, Scole, Norfolk.

Griffith's lantern-slide making camera, whole-plate size, new; 10s.—Guthrie, 7, Pitt Street, Leith, N.B.

Lancaster's 1889 Instantograph, packed; postal order 12s. 6d.—Letters, Volunteer, 53, Percival Street, Clerkenwell.

Enlarging camera (Lancaster's), £3 3s., nearly new, for £2 2s., bargain.—Cecil Wood, Ilfracombe.

Camera, etc.—Stirn's vest camera; cash or exchange; also whole-plate lens (Underwood).—Hardwich, Wells, Somerset.

Camera, Lens, etc.—A £12 hand-camera, with six double backs, 5 by 4 Ray lens, good condition; price £6 6s.—Can be seen at Swift's, 81, Tottenham Court Road, W.

Camera, Shutter, etc.—Quarter-plate Sciopticon camera, long focus, with six double slides, and enamelled leather case, very light, with Manx stand, cost £5 14s. 6d.; price £4 4s.; also Serjeant's shutter, 1½ in., 15s.—2, Carlyle Villas, Verner Road, Sydenham.

Camera, Stand, Slides, etc.—Camera, 5 by 4; folding stand, 3 dark-slides, printing frame, etc.; proof sent; very cheap; 33s. 6d.—Irvingstone, Birchington, Kent.

Detective Camera.—Watson's quarter-plate detective camera, with three slides, as good as new; £7.—A. Parkes, Ardiles, Dundrum, co. Dublin.

Kodak detective camera, equal to new, cost 105s.; price 75s.; or exchange with little cash for R. half-plate Universal lens.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Hand-Cameras.—Quarter-plate, Rouch's Eureka, very little used, cost £8 12s. 6d.; price £5; approval by arrangement.—B., 24, Talbot Street, Southport.

Facile hand-camera for sale (new). Wanted half-plate W.A. lens, 4 in. focus.—Wignall, Rose Villa, Bisham Gardens, Highgate, N.

Fret Saw.—Exchange Rodger fret saw machine good working order, for detective camera lens.—Smith, 48, High Street, Morley, Leeds.

Lantern.—Iron lantern, 4 in. condensers, good double lens, 3 wick lamp, nearly new, and in perfect condition, in case; £2 5s., or offers.—Howard, 117, Belmont Road, Liverpool.

Lantern and Condensers.—Dissolving view lantern, mahogany body, solid brass fronts, 6 in. condensers, complete in case; only £5.—Apply, Lewis, Photographer, Reading.

Lenses.—Voightlander's 5 by 4 Euryscope, rapid, new, cost 75s.; price 55s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Beck R.R. lens, 8 by 5, new; price, £3.—R. Woolman, Palmerston Street, Stockton-on-Tees.

London Stereoscopic Company's £8 8s. half-plate portrait lens, new; £5.—B., 9, Kimberley Road, Stockwell, London.

Half-plate instantaneous lens, Iris diaphragms, as new, 13s.—Spurrell, 6, Tavistock Place, Plymouth.

Ross's rapidly symmetrical whole-plate lens and stops; £1. Optimus half-plate portrait lens and stops; £2.—Brodie, 113, Fenchurch Street.

Splendid cabinet portrait lens, by Robinson, Paris, exchange quarter set, or sell; 35s., or offers. Pretty exterior background 8 by 6, linen, on roller; 12s. 6d.—Tooth, Caldecott Street, Rugby.

Capital half-plate rapid rectilinear; approval. What offers over 20s.?—Snell, 2, Canning Street, Nottingham.

Exchange excellent carte lens, by Squire, for half-plate view lens, by good maker.—Arthur Norman, St. Oyth, Essex.

Exchange 5 by 4 rectilinear, and quarter-plate portrait lens and cash for whole plate rectilinear or Instantograph.—Day, 35, Berger Road, Homerton.

Half-plate R.E. lens, by Marion; 30s.; cost double; approval; deposit.—Logan, St. Oswald's House, Tenby.

Dallmeyer's B 2 portrait lens, list price, £12 16s., for indoor portraiture; price, £5 10s.—Jno. Daniell, New Road, Llanelli.

Whole-plate Ross symmetrical, condition as new; 105s. Half-plate International set; 70s.—Palmer, Solicitor, West Hartlepool.

Photographic Apparatus.—Nine-cell dark-room electric lamp, in polished mahogany case, and plated fittings, very handsome, size 6 by 6 by 10 ins., cost £2 10s., take £1; perfect, almost new; Taylor's patent photometer for calculating exposures, cost £3, take £1; 2 dozen Wolfe's negative boxes, each box holds twelve half-plate negatives, take 8s. the

lot; the most compact way of storing negatives. What offers for Underwood's City detective camera, cash only?—Professor de Frere, Cambridge Street, Tunbridge Wells.

Roll-Holder.—Eastman's whole-plate roll holder, quite new; cost 85s., price 65s., or exchange with cash for Ross's half-plate Universal lens.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Set.—For sale, Lancaster's best whole-plate camera, 3 double dark-slides, Ross's lens, stand and case, good as new; lot £2; price double.—30, West Ham Lane, Stratford.

Quarter-plate Lancaster's International camera, Optimus 5 by 4 R.R. lens, two slides, case and stand in almost new condition, also rolling press with plate 1½ by 6; what offers?—E. A. Mansfield, 140, Great Clowes Street, Manchester.

Mahogany half-plate, long extension camera, double swing and reversing back, rising and falling front, three double mahogany dark slides, nearly new, and canvas case; price £4.—M., 42, Museum Street, Bloomsbury, W.C.

Half-plate camera, Sharp and Hitchmough, latest improvements, double extension, turntable top 4-fold tripod, 3 slides, 3 B Suter lens, and detective case combination; cost £18 18s.; price £12 12s.; Kodak with sixty exposures, £2 12s. 6d.—6, Montford place, Kennington Green.

Complete whole plate set to be sold very cheap; approval, deposit.—Evans, Minehead, Somerset.

Leather camera case for half-plate long-focus camera, takes also 3 slides, lens, shutter, and cloth; hand and shoulder straps, black outside, lined baize, 3 divisions, lock; condition as new; price only 15s.; approval on deposit.—Baxter, Bramley, Leeds.

Whole-plate exhibition camera, reversing frame, ditto Optimus rectilinear lens, Marshall's whole-plate drop-shutter, Mayfield's time shutter, Wood's whole-plate tripod, two double backs, price £10; Newman's quarter shutter, 163.—Wilfrid Powell, Rotherwood, Sydenham Hill, S.E.

Lancaster's 1887 half-plate Instantograph, four double slides, Optimus R.R., and Lancaster's W.A. lenses, tripod, cases, etc.; also half-plate hand camera for use with Optimus lens and slides, under and shutter; all in good condition; cost over £10; price 6 guin.; approval.—Turnell, chemist, Stroud.

Lancaster's special 1888 camera, 7½ by 5 rapid rectigraph lens, tripod, 2 double backs and other

accessories, nearly new, for £3; cost without accessories £10.—Trathan, 46, Freke Road, Lavender Hill, (or War Office, Pall Mall, by appointment).

Instantograph camera, half-plate, 1890, very finest order, long extension leather bellows, all improvements, fitted rapid rectilinear lens, Waterhouse stops, covers plate well, cork slide, quarter carrier and folding tripod, complete, £3 15s.; approval.—C. Carlross, 74, Hercules Buildings, Westminster Bridge Road.

Lancaster's 1889 half-plate Instantograph camera, double slide, tripod, and rapid rectilinear lens, f/8, with set of Waterhouse stops, quite new; bargain, 72s. 6d.—John Slade, Slad Road, Stroud, Glos.

Lancaster's Meritoire quarter set, complete; also good portrait lens, three double dark-slides, will sell or exchange for carpenters' tools. Wanted, for a half-plate 1888 Lancaster's Instantograph camera, three double dark-slides, also Thornton-Pickard time and instantaneous shutter, for 7 by 5 R.R. Optimus.—James Cottingham, 23, Station Row, Parkgate, Rotherham.

Whole-plate camera, screw adjustment, double dark-slide, stand, Optimus rectilinear and 9 by 7 symmetrical lenses, in perfect condition; 130s.—Dover, 8, Clifton Street, Wandsworth Road, London, S.W.

Camera, quarter-plate Instantograph 1889, all latest movements and improvements, reversing back, Instantograph lens and shutter, Iris diaphragms, slide, and folding stand, condition as new; 37s. 6d.; approval.—Green, 119, Willmott Street, Three Colt Lane, Cambridge Heath.

Superior set of slides on botany, hand-painted by Carpenter and Westley, 60 subjects, with lecture; price £2. Also a number of effects slides.—Lewis, Photographer, Reading.

Shew's adapter to half-plate camera, to take 10 by 8 pictures, with one double slide, 25s.; 10 by 8 rectilinear lens, £2; half-plate R.R. lens, £1; tripod for heavy camera, 10s. Wanted, half-plate wide-angle view lens.—Address, Upstairs, 12, Eckstein Road, Clapham Junction.

Special Bilcliffe camera, best make, use as quarter or half-plate, 11 double backs, four-fold stand, three Taylor's lenses, Iris diaphragms, bayonet flanges, R.R., W.A.R., both 8 by 5, landscape 5 by 4, Funnell's shutter, three cases, etc., cost £25. Seven vols. AMATEUR PHOTOGRAPHER, with binding cases, and

"Photography" to date, 100 "British Journals," 50 "Photo News," "Year Books," etc.; what offers?—Bostock, Eagle Mills, Manchester.

Watson's quarter set, long-focus camera, 3 double backs, R.R. lens, Kershaw shutter, sliding tripod, and solid black case, almost new; cost £10; price £5, or sell separately or exchange.—Lea, A. helpmpton, Dorchester.

Shutter.—Phantom shutter, ebonite, pneumatic release, 2½ in. hood or under; cost 27s.; price 15s.—Jno. Daniell, New Road, Llanelli.

Silver Watch.—Silver lever watch, excellent time-keeper (Waltham), offered for good quarter-plate or lantern-size hand-camera, or what offers?—Artist, Chronicle Office, Northwich.

Sundries.—Two half-plate Instantograph dark-slides, 14s.; Ashford's latest tripod, revis-d. half-plate, three-fold and sliding, 15s., cost 25s.; 7 vols. AMATEUR PHOTOGRAPHER, offers. Wanted, quarter camera and slides.—Wardleworth, Tailor, Blackley, Manchester.

Tandem.—Olympia tandem, in excellent condition, with lamp, bell, and valise; £19.—Bygrave, 15, Canterbury Road, Brixton, S.W.

WANTED.

Camera.—Loan (on hire, or with view to purchase) is desired for a month at Easter of a good hand-camera, suitable for foreign travel. Kindly describe disadvantages.—Letters to Mr. Biden, 11, Leadenhall Street, London.

Detective Cameras.—A hand or detective camera.—Franklin, Castle Street, Shrewsbury.

A good quarter-plate detective camera, the Eureka, by Rouch, preferred.—Kilby Mayfield, Bishopswood Road, Highgate, London, N.

Lantern.—Wanted Hughes's Paphengos, in good condition, for cash.—H. Cooper, Photographer, Northampton.

Lens.—Ross's rapid symmetrical, 6 by 5; cheap.—Snell, 2, Canning Street, Nottingham.

Negatives.—A few good half-plate landscapes and seascape negatives.—Send price to W. B., 49, Freshney street, Grimsby.

Roll-Holder.—Eastman roll-holder, quarter-plate, must be in perfect condition, for prompt cash.—Box 25, Post Office, Bradford.

Set.—Wanted in exchange for good violin, quarter Instantograph camera 1889, or good lens.—Trigg, 31, Bernard Street, Southampton.

"AMATEUR PHOTOGRAPHER" PRIZE TOUR COMPETITION, 1890.

(FIFTH YEAR.)

Competitors' work will be exhibited at the Crystal Palace Photographic Exhibition.

PRIZES.

FIRST PRIZE:

"AMATEUR PHOTOGRAPHER" GOLD MEDAL.

<i>Second Prize</i>	£4 4 0 and Silver Medal.
<i>Third</i> "	3 13 6 " " "
<i>Fourth</i> "	3 3 0 " " "
<i>Fifth</i> "	2 12 6 " Bronze "
<i>Sixth</i> "	2 2 0 " " "
<i>Seventh</i> "	1 11 6 " " "
<i>Eighth</i> "	1 1 0 " Certificate.
<i>Ninth</i> "	15 0 " "
<i>Tenth</i> "	10 6 " "

All photographs and MSS. must be endorsed "Prize Tour Competition," and addressed to the

Editors, AMATEUR PHOTOGRAPHER,
1, Creed Lane,
Ludgate Hill, London, E.C.,

on or before the 28th of February, 1890.

NOTE.—A copy of rules, form of declaration, and competitor's form will be sent on receipt of stamp.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the proprietors of the AMATEUR PHOTOGRAPHER have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

<i>First Prize</i>	Silver Medal and £1 1s. 0d.
<i>Second Prize</i>	Bronze Medal and 10s. 6d.

Photographs must be sent in on or before Monday, the 10th of March. This date will permit of photographs of the Opening Ceremony, which is to be performed by H.R.H. the Prince of Wales on the 4th of March.

The proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editors of the AMATEUR PHOTOGRAPHER, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—"Forth Bridge Competition," The Editors, Amateur Photographer, 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS OF THE AMATEUR PHOTOGRAPHER will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP)

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	...	Feb. 14	...	June 14.
LANDSCAPE WITH FIGURE	...	Mar. 14	...	July 14.
GENRE OR FIGURE STUDY	...	April 14	...	Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	...	May 14	...	Sept. 14.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the AMATEUR PHOTOGRAPHER.

Entry forms on receipt of stamped addressed envelope.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the AMATEUR PHOTOGRAPHER; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his personal experiences. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th February	...	Apparatus.
28th March	...	Optics.
28th April	...	Action of Light.
28th May	...	Exposure.
28th June	...	Plates and Films: Their Development and After Treatment.

All MSS. to be addressed to the Editors, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London E.C.

[PRICE TWOPENCE.]

✻ OUR VIEWS. ✻

"To hold as 'twere the mirror up to nature."—Shakespeare.

IN another column we announce short notice of the AMATEUR PHOTOGRAPHER, 1890, Travelling Studentships. Full particulars as to conditions for competitors and the conditions for prize winners, regulating the tours and their photographic work will be ready shortly, and application should be made by letter. The three subjects set for competition are, in our opinion, of about equal value; we mean that photographic work in either of the three subjects will require the same standard of ability. The first three prizes offered are intended to recoup, or partly so, the winners for the expenses they will incur in taking a photographic tour, and is based upon a payment to them of £7 per week.

We trust the offer that we have made will induce many amateur photographers to enter the competition and send us their best work. The idea of paying the expenses of a trip with camera, etc., has certainly the merit of novelty, and we feel sure that the prize winners will find much pleasure in allowing us the privilege of publishing prints from the negatives taken during their holiday in the summer of 1890.

* * * *

OUR apologies are due to the contributors to our "Monthly Competitions," for the non-publication of awards. The heavy work in hand just now preparing for the Exhibition must be our excuse.

* * * *

A VERY capital exhibition was opened at Kidderminster last Saturday. Some 800 pictures were exhibited. Local work was not as strongly represented as we should like. The AMATEUR PHOTOGRAPHER Silver and Bronze Medals were awarded for the work of members of the Worcester-shire Camera Club, and we trust that another year even more may enter in competition for them. There was one class, "Genre Study Competition," a fixed subject being given, "The Vicar and his Guests," in which, notwithstanding the fact that this competition with others of a similar character have been persistently advertised in the columns of a contemporary, for some nine months, they

offering their silver and bronze medals, there was no entry. The marvel to the judges (Messrs. Harrison and Hastings) was that neither the editor nor sub-editor of our contemporary competed. But some judges have a nasty way of not allowing themselves to be coerced into making awards.

* * * *

SOME few weeks since we announced our intention of offering prizes for a "Ladies' Photographic Competition." In another column we give particulars of prizes, conditions, etc. As already stated, we shall hope to exhibit the photographs at our offices during the month of June.

* * * *

WE are advised by our publishers that AMATEUR PHOTOGRAPHER "Prize Pictures" No. 1 is nearly out of print. We are pleased to be able to add that the commercial success of the "new departure" is sufficient to warrant our issuing further numbers, and we shall announce particulars at no distant date. Of course, it was not to be expected that the AMATEUR PHOTOGRAPHER "Prize Pictures" would find favour at the hands of all our photographic contemporaries. One gives us credit for imitating *Sun Artists*: we would ask, even if that were so, where's the sin? But the ignorance of the reviewer in making such a statement is shown by almost the next sentence; he says, "Which are reproduced evidently in *collotype* and mounted on thick paper." For his information we would add that they are reproduced by what is known as the Woodbury process, and that it is not general to *mount* collotype prints. This wiseacre proceeds to say that four, out of five, "subjects are good," and concludes by adding, "We can only say that if they are put forth as specimens of prize work—indeed, the pick of amateur photographic productions—amateur photographers are not honoured thereby." What presumption for such an ignorant scribbler to place his judgment above that of J. R. Herbert, R.A., A. M. Rossi, and H. P. Robinson!

Another reviewer is of opinion that, "if these five pictures had been reproduced by photo-etching or direct platinum print they would have been inestimably better." We thank both of our contemporaries, and will try and

derive benefit, and profit from their advice, but shall issue "Prize Pictures" No. 2 with illustrations by the Woodbury process.

* * * *

WHILST upon the vexed point of illustrations, we cannot refrain from drawing attention to the very admirable print published as a supplement to the *Photographic Art Journal*, a reproduction of a picture "Great Yarmouth Harbour," by Dr. P. H. Emerson, photo-etched by himself. The print is the work of Mr. Walter Colls; it is one of the best we have seen, and far surpasses those issued with No. 2 of *Sun Artists*. The photograph happens to be one taken by the Doctor either before he had the "Naturalistic" fever, or, perhaps, having recovered from the malady, it has been taken since. There is not the least suspicion of fuzziness, and the picture is extremely beautiful.

* * * *

THE "Home Portraiture" number is now published, and although it may not give entire satisfaction to all, it will, we trust, be found a very useful addition to illustrated photographic literature.

* * * *

WE have asked the judges in the recent "Lantern Slide Competition," to re-consider their awards in Class II., "Collodion Process," and will publish the result in our next issue.

* * * *

THE number of competitors in the "Prize Tour Competition" are fewer than last year. This was to be expected, because the conditions are much more stringently drawn up. In several cases we have been compelled to refuse to receive the photographs sent us, because the conditions were not complied with. A very excellent set of pictures, entered by a prominent and successful amateur worker, were returned because he did not consider it necessary to comply with our conditions. In all, there are between forty and fifty entries, and we shall show nearly all of them at the Crystal Palace Exhibition, some 400 frames. As a whole, they are the best that have been sent us, and will, we are sure, contribute to the general interest of the Exhibition.

Our invitations for the Crystal Palace Exhibition will be sent out by the end of the week, and we hope that as many as possible will be present on Friday, the 14th inst. "Afternoon tea" will be served immediately after the lantern show. We understand that the lantern is a very powerful one, and that lenses have been made specially for this year's show, which will be under the care and entire direction of Mr. Brooks. Messrs. Peasgood and Wollaston have, we understand, every reason to be satisfied with the entries, both in the apparatus and art section. The Exhibition will be a most brilliant success. For ourselves, and our contributors in both "Prize Tour" and "Lantern" Competitions, we are deeply grateful for the opportunity of showing the public the admirable work contributed to the AMATEUR PHOTOGRAPHER Competitions.

* * * *

THIS week we commence another novel feature, *i.e.*, "ScienceNotes." A column more or less will be devoted to this purpose every week, and efforts will be made to give the very latest information on the science of photography and its application to spheres of usefulness outside the art of

picture making. Some will recognise the contributor under the very thin disguise of his *nom de plume*, and will be quite satisfied that the work will be done well; to those not so fortunate we can only give our assurances that he is capable of the task set before him, and will keep us well posted up in scientific and practical photography.

* * * *

IT is intended to make several changes in the PHOTOGRAPHIC SOCIETIES' REPORTER. The work of societies will be commented upon by the Editor. Matters of interest to members of societies will be noticed, the work of advising and criticising will be extended, and, in fact, every possible assistance will be rendered to members of photographic societies, whether professional or amateur. The Editor will advise as to drawing up of rules, alteration of rules, conditions of competitions, judging and reporting upon members' work, selection of apparatus, fitting up of dark-rooms, studios, etc., etc.

* * * *

MATTERS are pushing on at Liverpool. If the Photographic Association get the same support from the Liverpool Corporation as they did last year, and secure the Walker Art Gallery, it will be the first step to success. We hope arrangements will be made for cheap railway tickets from London and all principal towns.

* * * *

WE are pleased to be able to announce that, although we cannot give the readers of the PHOTOGRAPHIC QUARTERLY either of the pictures voted for by coupon, Mr. H. P. Robinson has kindly consented to allow us to reproduce his very celebrated picture "He never Told his Love." It is our intention to reproduce this picture by the Woodbury process, and we hope to be able to give a far more truthful rendering than do those which have recently been reproduced by photogravure. Whilst on the subject of the QUARTERLY, we may mention that the following articles, for the April number, are in the printers' hands:—"Is Retouching Immoral?" by Alfred Paterson; "Photogravure and Heliogravure," by P. G. Hamerton (Editor of the *Portfolio*); "The Optical Lantern as an Aid in Teaching" (illustrated), by C. H. Bothamley, F.I.C., F.C.S.; "Photography of the Sky at Night," by Captain W. de W. Abney, C.B., R.E., D.C.L., F.R.S., etc.; "A Phase of Naturalistic Focussing" (illustrated), by H. Dennis Taylor; "In the West Country" (illustrated), by William Gibbons; "The Limits and Possibilities of Art by Photography," by George Davison. In addition to the illustrations already referred to, we have pleasure in stating that a portrait will be given of Mr. George Davison, the courteous Hon. Secretary of the Camera Club. It will, we think, be admitted that the standard of excellence already reached by the PHOTOGRAPHIC QUARTERLY will be maintained in the April number.

* * * *

PHOTOGRAPHS IN COLOUR.

EVERY experimental photographer has had the question addressed to him, "When are you going to give us photographs in all the varied colours of nature?" The question is not an unnatural one, for to most minds it would appear that science has achieved far greater marvels than this. The electric telegraph, which flashes its messages from continent to continent, and girdles the world in

less time than the forty seconds which formed the poet's dream, has become such a part of our everyday lives that we cease to regard it as a wonder. The telephone and phonograph, with their reproduction of the sounds of the human voice, are later marvels to which we are gradually getting accustomed, and, compared to them, the production of a picture in colour would seem to be quite a secondary matter. The conscientious photographer when tackled on the subject, feels inclined to waive it. He is aware that certain experiments made long ago by Becquerel and others have given indications of colour upon a surface sensitive to light, and he also has in his mind the opinions of descriptive writers, who on many occasions have let their imaginations run riot, and have written of photography in colour as a discovery which is bound to come sooner or later. He is thus constrained to give a vague reply to the question addressed to him, and either shakes his head with a meaning air, as if he could tell you a great deal about the matter if he only cared to, or he is honest enough to confess that he does not know.

The dream of photography in colours has haunted many people of imaginative mind ever since sun pictures became possible. We may be quite sure that Daguerre, whose profession as a scene painter led him to use the camera obscura as an aid to sketching from nature long before he attempted to fix its beautiful images, allowed his mind to dwell on the possibility of finding a means to render those images permanent in all their natural tints. And it may have come as a surprise to him later on, when accident showed him how their forms could be impressed upon a silvered plate, that the image he obtained was not associated with its original colours.

Many circumstances have conspired to lead the general public to suppose that pictures in colour will be the crowning achievement of photography. In the early days of the art, more than one pretender asserted that he had discovered the secret, and exhibited pictures which he said owed their tints to no hand but that of the sun. Indeed, such pretensions have cropped up continually, like sun spots and other periodic phenomena, and we need only turn over the pages of any photographic journal to find instances which have occurred within the past two decades. Such an announcement gets at once great publicity and free advertisement, for the general public are greedy of anything of a sensational and supernatural kind, and the modern reporter is always at hand to supply them with as much food of the kind as he can get hold of. More than this, he does not let them have it in its crude state, but garnishes it with all the spice and seasoning which his imagination can command. The fact that the carbon or autotype process will furnish a picture in any one colour, at once affords him an opportunity of saying that the next step must be a polychromatic photograph. The photographer well knows that the problem of photographs in colour is not brought any nearer because by mechanical means we can produce a picture in any one pigment. Then there have been other processes—still of a strictly mechanical nature—such as one worked out by Woodbury, by which coloured photographs have been possible. The various methods of tinting a semi-transparent photographic image on the back, so that the colour shows through with softened effect, have also done their part in keeping up a popular delusion. But photographs in colour—that is the delineation of nature in its varied hues by means of the camera—must be considered,

in the present state of our knowledge, as nothing less than a delusion.

Much time and money might in the past have been saved if believers in the possibility of colour photographs had taken the trouble to make themselves acquainted with the works of those who have made the subject of colour their study, and from whose labour theories have been formulated. One of these appears to have been founded upon the experience of painters, who have shown that with three colours, red, yellow and blue, and the various tints compounded from them, they could produce a tolerable representation of the hues of nature. In this way the theory came gradually to be accepted that there were in nature three primary colours from which all others were derived. Sir David Brewster gave his sanction to this theory, and it was for long accepted as true, and if we confine ourselves to experiments with pigments it is not difficult to support it. But when we come to test its truth by means of the pure colours of the solar spectrum, and deal with coloured light instead of impure pigments, it fails to give those results which its advocates claim for it.

The theory with regard to colour which is being now more generally accepted, is that of Young, which was formulated as long ago as the beginning of this century, but which has more recently been revived by Helmholtz and other well-known physicists. This theory teaches us that every portion of the retina is capable of receiving and transmitting to the brain, by means of nerve fibrils, three distinct colour sensations, one corresponding to red, another to green, and another to violet. If all these sets of nerves are stimulated in a like degree by these various colour-sensations at the same moment, we perceive what we call white, which is a mixture of all colours. Light consists of waves, some long and some short; the longer waves stimulate the set of nerve fibrils which give us the impression which we call red, those of medium length give us green, while the shorter ones correspond to violet. But it is evident that the work of translating these wave-motions so that they generate in us the sensation of colour, is the work of our brains, and that outside of us, as an objective thing, colour is non-existent.

Theories are regarded by many people with suspicion, and they are ready to show that many a one has had to give way in the light of increased knowledge. This is so, but a theory is a good thing to take note of until we have something better to hold on to. This theory, which is based upon experiments with coloured light, has the support of many noted men, and its truth is endorsed by investigations concerning that abnormal perception of colour, common to a large percentage of civilised men, which is known as colour-blindness. If we accept this theory as one which is founded on a correct basis, we must, in our present state of knowledge, confess that photography in colour is an impossibility. The realisation of the dream would imply the possession of some new substance which would become red when acted upon by the longer rays of light, and green and violet when submitted to the action of shorter rays. The same substance must be sensitive also to the thousands of tints which are made up of mixtures of the colours of the spectrum. Some persons will see no difficulty in believing that such a substance may be within the bounds of possibility, but some persons believe in perpetual motion, and some in the flat earth theory.

Letters to the Editor.

MOUNTING.

SIR,—I see in your issue of the 21st inst. the method of mounting by T. W. Bacon, which I consider a good deal more tedious than the way I always adopt, viz., to soak the prints in water until thoroughly soft, not taking them out until the very last moment. By that I mean never to have more than one print drying at the same time. Before this, however, I have prepared two plates for each size of photographs I am going to mount, which I do thus:—

With a piece of moistened rag, rubbed on castile soap, I smear them over lightly to prevent the print sticking, and taking the print from the blotting paper, lay it evenly on the glass without pressure, then with a good brush put on the mountant, taking care that there is not too much of it, and also that the edges are as well covered as the remainder. Then, turning the glass over, I can perfectly well see where to drop it on the mount, and having pressed it home, lift the glass off. The print having been squeezed fast, is finished as far as it goes. The next print can go on the same glass without smearing until there is too much "side" gum to be pleasant, but I can generally "run" ten to twelve prints without bothering, having regard to putting the prints on the same grain line to prevent unnecessary dirt on the paper. I may mention I use the gelatine process, which does not curdle before you have time to finish. It is out of Wall's Dictionary, but I think his quantum of gelatine too little, and make it 240 grs. gelatine with $2\frac{1}{2}$ ozs. methylated spirits, and 6 ozs. water. Anyone wanting to make it must read his article, as it all depends how it is made. For about 4d. you can make 2s. worth of bought mountant, and as good if not better than most of them.—Yours, etc.,

J. C. B.

February 26th, 1890.

* * * *

PHOTOGRAPHIC SOCIETY AT BROCKLEY.

SIR,—On Monday evening, the 17th ult., I read a paper at the Lewisham High Road Congregational Lecture Hall, before the members of the Literary Society, entitled "Our Camera Club," and exhibited about ninety-five slides, amongst which were forty-eight kindly lent me by the Editors of the AMATEUR PHOTOGRAPHER, and which I need not say were highly appreciated.

My object in giving this paper was to rouse sufficient interest amongst the members of this society to enable us to start a camera club, and it now remains to be seen whether such an institution can be floated.

Will you be kind enough to make it known that we shall be glad to receive the names of amateurs, or of those who think of becoming such, and who would like to join this club.

A preliminary meeting will be held, when all details will be arranged. Ladies will be admitted as members.—I am, Sir, yours faithfully,

B. DAVIDSON.

40, Sandbourne Road, Brockley,
February 25th, 1890.

* * * *

THE AMATEUR: WHAT MAY HE DO?

SIR,—I have for some years thought that the qualifications of an amateur photographer should be drawn up and settled by some competent body.

Mr. Feilden's letter of last week on the matter is, I think, open to question on several points. Firstly, as regards his proposal "that an amateur should not receive out-of-pocket expenses from friends for a negative or prints." Surely so long as he makes no profit out of it, to disqualify him for merely charging out-pockets would be most unjust, unfair, and entirely without precedent. This proposal, too, forms a curious contrast with another proposal, "that an amateur may be a partner in any firm for reproducing the work of others for the purposes of illustration." I fail to see how these two proposals can be reconciled, and I disagree with them both.

The proposal, too, "that amateurs may be makers of plates, etc., and of every article in connection with photography," is clearly against every fair principle of amateurism. A boat-builder may not enter in a boat race for amateurs, and the rule is the same in every class of amateur competitions.

With reference to the proposal "that an amateur should not

receive money prizes" (which is, I venture to think, beyond dispute), I should like to point out the danger of the money prizes offered in every week's issue of the AMATEUR PHOTOGRAPHER. I feel confident that the winner of any amateur competition could be successfully objected to if he could be proved to have at any time taken a money prize.

I also disagree with the proposal "that a professional should be entitled to compete as an amateur after having retired from business for twelve months." "Once a professional always a professional," is a good old proverb. The professional competitions would always be open to him.—Yours truly,

March 3rd, 1890.

C. N. F.

SIR,—I fear your correspondent, Edward J. Feilden, has not cleared the way to a successful solution of this question. He says, "An amateur giving lectures, and illustrating his lecture by photographs, shall not forfeit his status by so doing." So far so good. But how about the wily amateur who, to make an honest penny, gets up a lantern show at popular prices, pads the thing with a sketchy description of the views, and dubs the mixture a lecture?

Again, "An amateur knowingly competing in a class open to professionals shall lose his status as such thereby." This is absurd, though the rule is enforced in some foot-racing societies. But in football—no more strict lines, with regard to professionalism, are insisted upon than in this popular game—an amateur can play either with or against a registered professional. I think amateurs are quite able to hold their own even in an open competition, and I see no valid reason for debarring them.

"The term professional shall not apply to professors or teachers at colleges, schools, naval, military, or public institutions." In this phrase is included the man who, though not directly earning money by taking portraits, etc., yet is daily engaged and paid to instruct and send out a swarm of young photographers who intend to make their bread and cheese as professionals. Now, if this man does not make his living by photography the logic that would prove the opposite I fear would never convince yours truly,

B. LAWRENCE.

March 3rd, 1890.

* * * *

ROYTON EXHIBITION.

SIR,—Your cheap and—well, let us say, sharp contemporary has stumbled upon a mare's nest of unusual brilliancy in assuming that your report of the Royton Exhibition was copied from his own. I am at a loss to know what justification he can find for so reckless an assertion, unless he imagines he has a patent for describing the pictures in the numerical order of the classes, instead of the order in which they were hung in the Exhibition, and numbered in the catalogue (thus Class XIV., No. 66 to 71, comes next to Class I., and is followed by Class XX., Nos. 71 to 84). Certainly every picture was examined personally, catalogue in hand, of which I think the report bears sufficient internal evidence.

He professes to find mistakes into which he fell "duly copied." Well, as every number, title, name of picture, and award of medals was taken direct from the catalogue, even when, as happened in two or three cases, the prize label was attached to the wrong picture of a series, if there has been any copying of mistakes, it has arisen through both of us copying from a catalogue in which mistakes *may*, no doubt, exist.

If he imagines I have copied his report, blunders and all, perhaps he will explain why I have not copied his remarks on Class XX., or the name of W. H. Kitchin spelt wrongly in Class VII. (since I saw his spiteful comment, I have been taking his advice and "amusing" myself by comparing the two reports), or his title for Mr. Whaley's picture in Class XIV., where, as in Class VIII., I have followed the catalogue, notwithstanding the apparent discrepancy; or again his blunder in Class XXI. as regards the title of Mr. Sutcliffe's picture, which he absurdly calls "Time."

It is, perhaps, not to be wondered at that two independent critics should agree as to the merits of a majority of the pictures, but our agreement is, I am happy to say, by no means universal. I have not hesitated, for instance, to express divergence, when necessary, from the opinion of the judges; and that our views on good taste are by no means identical, is manifest from my remarks on Class XIV., which, had I desired to be spiteful, I might have characterised in much stronger terms. I am

not concerned to defend my opinions on champion classes, nor are they necessarily identical with those of other contributors to your journal, but it may be worth note in passing that I have given expression to arguments both *pro* and *con*. My own personal opinion is that were exhibitors perfect, they would be *undesirable*, and that "one picture, one medal" is the best rule, but, on the other hand, they are perhaps necessary to attract to our provincial exhibitions work that could not otherwise be seen there, and that if this can be done at the cost of a couple of medals, the price is, perhaps, not too heavy. Apologising for length of this communication, which is more notice than the petty attack deserves, I subscribe myself,

YOUR CRITIC.

CONSTRUCTION OF CONDENSERS.

SIR,—I am much indebted to the correspondents who have answered my questions about the construction of condensers for enlarging purposes. Mr. Muncey's account of his method of illumination (in the issue of February 14th) is very interesting. There is, however, one omission in it. The brass tube cannot be fixed firmly in the side of the wooden box if it is to be movable, and thus around the tube there must be some space free for the escape of light, which would also find its way through the tube itself. How does Mr. Muncey obviate this?

The letters of Commander Walters and "Stradivari," in the last number, are most valuable, and contain many serviceable hints. I am surprised, however, that the former gentleman should have found the use of ground glass necessary with his condenser. Surely this would indicate that the illumination obtained with the condenser alone was not as even as he imagined. The focal length of his lenses would seem to be much longer than mine.

But while expressing my gratitude to these correspondents, may I at the same time express the hope that their efforts will stimulate some one else to reply to the two most important of my queries, which still remain unanswered:—

(1) What is the relation of the radius of the sphere of which the convex side of the lens forms a segment to the focal length of the lens?

(2) What is the proper place for the illuminant? Is it at such a point that the *issuing* rays are parallel, or if not, where?

Could I but get answers to these two simple questions, which must be A B C to anyone acquainted with the elements of practical optics, I should be quite happy, and could go ahead with satisfaction, and, I feel sure, success.

I think my method of making the lens is a little simpler than either of those described, and in case it should be useful to others it may be worth description. From the circumference of the flat piece of glass I cut out a semicircular piece about $\frac{3}{4}$ in. in diameter. The cement was then laid pretty thickly on the edge of the same piece and the curved glass bedded in it, any interstices being filled up carefully with cement. When the cement was dry the glycerine was poured carefully through the semicircular aperture, which was then closed by cementing a bit of india-rubber cloth over it. So arranged, the joint was perfectly water-tight, but as an additional precaution I cemented a stout piece of tape over it cut half through in alternate segments, so as to lie flat on the circumference and on each side of the lens. The pair was then mounted in a square oak frame, grooved on the inner face to receive the edges of the glasses. These were thus only supported at four equidistant points, but this seemed sufficient, and the escape of light at the angles could be prevented by a cardboard screen.—I am, Sir, yours faithfully,

March 1st, 1890.

W. L. GROVES.

* * * *

MOVEMENT.

SIR,—I have just returned from a short tour in sunny lands, where I have been photographing. My camera was one of McKellen's 12 by 10, and I used a Ross' Rapid Symmetrical, and a Newman's shutter. But nearly all the negatives, when the shutter was used, have the appearance of the camera being shaken at the time of exposure. I gave the eighth of a second in each instance. I consulted several practical photographers, and they all agreed that it was the fault of the shutter. I should esteem it a great favour and help if some of your readers who have used Newman's shutter with a large camera would give me their experience, whether they have found the same fault in their

negatives after using this shutter. I met a gentleman abroad who assured me that the best shutter made was one by Londe and Dessondeix, in Paris. Passing through Paris, I went and examined the shutter, and it certainly seemed to bear out the recommendation of the gentleman who told me of it, that it would not jar the camera in any way when in use. Another gentleman recommended the Mاتيoli shutter. I went and examined that shutter also in Paris. It appeared a good one, but not to my mind at first sight so good a shutter as the former one.

Anyway, a good shutter which does not agitate the camera at exposure is an absolute necessity, and I think it will help others besides myself, if you will allow this subject a little ventilation in your valuable columns.

I quite allow that a large 12 by 10 camera requires for steadiness more solid support than a mere tripod can give it. At least, I think so.—I remain, truly yours,

EDWARD HUSBAND.

* * * *

CUSTOMS OFFICERS AND DRY-PLATES.

SIR,—The question raised by your correspondent, "An Observer," in query 3,506, is of some importance to travelling photographers, and an experience that occurred to myself at Southampton last November may be useful to others beside "An Observer." After a long vacation, spent in Jersey last autumn, I returned to England with about half a gross of whole-plates, exposed but not developed, packed in grooved boxes in my portmanteau. Having declared the small amount of dutiable articles in my possession, the officer commenced his inspection, and soon came across the boxes of plate; these he wished to open, but, fortified by Lord Salisbury's remarks in the House of Lords last summer, I strenuously opposed any such proceeding on his part, and produced a small ruby travelling lamp, saying that if he chose to show me to a dark-room I would let him examine the contents, not otherwise. Ultimately he sent for his superior officer, with whom I had no difficulty. There is a dark-room at the Southampton Docks, but of Weymouth and Plymouth I have no experience. In any case your correspondent will be safe in resisting efforts made by unintelligent officers to open boxes of dry-plates, and in demanding, if necessary, to see a superior officer. The production of a small ruby lamp and expressed willingness to open the boxes in some dark-room usually disarms suspicion and ensures a speedy release.—I am, etc.,

GEORGE T. HARRIS.

* * * *

REDUCING CAMERAS.

SIR,—We notice in your last issue a letter from Mr. John Platt, stating the sliding-rod arrangement—which we claim as a novel feature—was in use thirty years since.

Of course, inventors and patentees well know that it is almost impossible to design anything, however honestly, and publicly advertise it without someone being able to prove, like Solomon, that there is nothing new under the sun.

We can only say that the whole arrangement and every detail of construction were designed by our Mr. Pearson without attempting to copy from any source whatever. So far as we know, the following features are original as applied to a reducing camera: The method of adjusting the negative, the sliding-rod arrangement, the sockets for holding the rods, the mode of securing the dark-slide, the permanent combination of a *small* camera, having focussing screen size of a masked slide, with a large sliding box for any sized negative. These features have not been anticipated at the Patent Office.

Trusting you will find room for this reply, we are, etc.,

PEARSON AND DENHAM.

PHOTOGRAPHY is employed in the United States to recognise good wood. Micro-photographs are taken of sections, longitudinal and transverse, of standard pieces of timber bearing a certain known maximum or minimum strain. These are enlarged, and served as comparisons for other samples. Any piece which the educated eye detects as having fewer rings per inch diameter, fewer fibres, or fewer radial plates per square inch of section is rejected. The advantage of the method is that it allows all timber for important positions to be tested before being used.

The Complete Photographer ;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

BY H. P. ROBINSON.

CHAPTER V.

Exposure.

PUPIL.—To-day you promised that we should make some pictures.

PHOTOGRAPHER.—I think not. We are a long way from that at present. I remember saying we would expose some plates, which is *not* the same thing, although I do believe there is a popular delusion among amateurs to that effect. We should learn to walk before we try to run. We will learn to make photographs first, picture making may come afterwards. To that end we will expose some plates without much care for the subjects. We need not go further away than the garden, or use a larger size than half-plates. A group of trees, some palings and a few garden implements for a foreground will afford all we want in the way of subject at present. But first we must put some plates in the holders. With the solid holders you draw out one slide, remove the blackened square of tin to which a spring is attached, and place the first plate face downwards, replace the tin to separate the plates, and keep them in their places, and then insert a plate, face up this time, under the catches at the end, the other end being fixed with buttons. The slide is now replaced and we are ready for action. It may be as well to mention before we go that some photographers back their plates to prevent halation. This is done in various ways; one of the best is with ivory black or burnt umber mixed up with a little gum water; but it is a messy business, and I don't think the result pays for the trouble and inconvenience. I have had very little damage from halation although I see evidence of it in many photographs. If a plate has a sufficiently thick or opaque film of emulsion there is little fear of this annoying defect. It is the use of cheap thinly-covered plates that causes the mischief.

PUPIL.—You have not told me what halation is.

PHOTOGRAPHER.—It is a blurring quite distinct from the fuzziness caused by the image being out of focus, and produces even more softness, yet there is no school at present for the cultivation of halation as there is for the other defect. You will notice in some photographs that the lights appear to spread over the shadows. This is most visible where there are extreme contrasts, as in interiors, where the light from the window spreads like a halo around the dark edges. This effect is caused by reflection from the back of the plate. The rays of light forming the image—or rather the brightest of them—penetrate the coating of the plate and are reflected back against the underside of the film. If they were reflected back in a straight line this would not show so much, but all except the central pencils reach the film at an angle, and of course reflect at an angle, hence the halo, or halation. Now, for the garden; come along with the camera.

PUPIL.—Shall I set up the tripod here?

PHOTOGRAPHER.—That will do nicely. From this spot we shall get in the tops of the trees, and also include sufficient foreground. Place the camera on the stand, and see that it is firm. A pad of felt between the camera and the top of the stand greatly increases steadiness without the necessity of very tight screwing. Now I leave it to you to get your subject on the focussing screen so as to include the most picturesque elements. It is of no consequence for our pre-

sent purpose, but it is good discipline to accustom yourself to look out for beauty.

PUPIL.—It is all very well to look out for beauty, but I can't see anything!

PHOTOGRAPHER.—Because you have not learnt to see. There is more in seeing, in many ways, than meets the eye. For the purpose of selecting your picture you may remove the diaphragm from the lens, but not for focussing, as I will presently explain.

PUPIL.—Ah! now I see better. Will that do?

PHOTOGRAPHER.—You have cut off the tops of the trees, always an ugly effect, except in the case of very near trees where you only use the lower half of them and the branches fill the top of the picture. In this case there are two methods of procedure. You may raise the sliding front, which will have the effect of cutting off some of the foreground, if you have it to spare, and giving it to the sky. Or the same effect may be produced by looking upwards with the lens. This is what the eye does and is the true and natural way of looking at it. Yet we have here an illustration that in some cases convention is better than absolute truth. Not even a naturalistic, not even one who has been trained so minutely as to distinguish the difference between a wasp and a saw-fly, and would be supposed to know something of the appearance of things, would allow that a tall building was correctly represented by converging vertical lines. And it appears wrong and awkward to all eyes, trained or otherwise. This is one of those cases in which absolute truth looks false and shows the necessity of conventions. I have never seen this disregard of the perspective of vertical lines alluded to. The problem may be thus shortly stated. The further parallel lines recede from the eye the more they will appear to converge. This is visible enough anywhere. If you look along a straight line of railway, standing between a pair of rails, the lines appear wide apart close to your feet and to meet in the distance. This is an effect of perspective universally recognised on the ground, or with horizontal lines, but never with vertical; yet if we could imagine the pair of rails running upwards to the zenith the same effect of perspective would be visible, the rails would converge to a point. In the present case we may disregard the apparent distortion, as we have no marginal lines to show it, but I may as well mention here that there is a way of overcoming the convergence. We will turn the camera round to the house for a moment and settle this point. Place it quite level. What do you see?

PUPIL.—The lines are upright, two-thirds of the height of the house only comes in, and there is a good deal too much lawn in the foreground.

PHOTOGRAPHER.—And if you had a cathedral before you the effect would be the same. You would lose the towers and get a vast expanse of pavement. This can be cured in a minor degree, as I have already pointed out, by raising the front of the camera. Now tilt the camera until you include the top of the house.

PUPIL.—And the lines converge.

PHOTOGRAPHER.—Naturally. The top of the house is further from you than the bottom, and is therefore perspective smaller. But custom decrees that the lines shall appear upright. Now they will become so if you have your focussing screen parallel to your building. Here comes in one of the uses of the swing-back, but it is a device I dislike and never employ if I can help it. If the back is swung outwards from the bottom, the screen can be made parallel to the buildings, although the eye of the camera is looking upwards. The lines will now appear parallel with the margin of the picture. The defect of this arrangement is the loss of focus in the foreground, for to favour the definition of that part the swing-back should be used in exactly

the opposite direction, as we shall see when we come to the landscape, to which we will now return. I should mention that a good deal of the difficulty could be got over by the use of long-focus lenses, and getting away some distance from your object; but it seldom happens in photographing buildings that there is sufficient space of level ground to get far away, and to descend is to increase the difficulty.

PUPIL.—What bell is that?

PHOTOGRAPHER.—That is the knell that summons us to luncheon. We are not half through our present subject, and will break off here for awhile.

Winter Work.—XXII.

By T. C. HEPWORTH, F.C.S.

PHOTOGRAPHY BY MAGNESIUM LIGHT.

PORTRAITURE by the aid of the highly actinic light afforded by burning magnesium is not by any means a new thing. So long ago as the year 1865 it was proposed to use the metal magnesium in much the same way that it is used now, that is to say, for flash-light purposes. But there are two reasons why the suggestion was not taken up with alacrity, one being that the metal was at that time a very costly article, and the other reason being that the amateur photographer was almost unknown, and professionals were too busy in other ways to trouble themselves much about a mere matter of experimental interest. Nowadays flash-light photography has become so common that it would not be an exaggeration to affirm that tons of the silvery magnesium powder are dissipated in light and vapour during the winter season in this country alone. It is certain, too, that many use the metal as a help to daylight on those dull days with which all are familiar, except those who have the good fortune to live out of range of city chimney pots.

Magnesium was first used as a help to photography in the form of wire or ribbon, and lamps were made in which it could be conveniently burnt. In the official report on the Paris Exhibition of 1867 I find the following reference to the use of such lamps: "The newly discovered metal, magnesium, by the brilliancy and whiteness of its combustion, resembling sunlight, has enabled photographers to secure pictures in vaults and other places inaccessible to ordinary light. It has also been made to supply the place of the sun itself in the solar microscope, or enlarging apparatus constructed on the same principle. In order to ensure its steady combustion, lamps have been contrived to secure the gradual supply of a ribbon or wire of the metal. Mr. Solomon, in England, exhibits a very convenient apparatus. The trial before the jurors was perfect. In Austria is a smaller but similar lamp for the same purpose."

The Commissioners who are responsible for this report are certainly wrong in speaking of the metal as being "newly discovered," for its discovery was made at the very beginning of the century by Sir Humphrey Davy. But as that great investigator only produced it in very small quantities, it could not form the subject of much experiment until by the labours of others it was brought within the commercial horizon. Solomon's magnesium lamp seems to have been the prototype of a number which have since been devised on precisely the same lines, possibly by inventors who never saw the original. It consisted of a metal box containing a train of clockwork, which fed the metallic ribbon between rollers into a spout, which delivered it at the focus of a parabolic reflector.

Another form of lamp of about the same date as that of Solomon, is one devised by Larkin, to burn the powdered metal. The means by which this was accomplished were very ingenious, but quite different to the flash method with which we are all more familiar. The principal feature of the lamp was a hopper, or containing vessel, which was charged with the magnesium powder mixed with a certain quantity of silver sand, so as to help it in its flow—hour-glass fashion—through a small orifice. This orifice could be opened or closed by the action of a conical plug which was affixed to a lever action. When this lever was depressed, the orifice was uncovered and the powder fell in a steady stream on to the flame of a spirit lamp beneath, so that as long as the hopper remained open, and the store of magnesium and sand was not exhausted, a brilliant flood of light was given out by the lamp. That this light could be depended upon is proved to some extent by the circumstance that two lamps constructed on this principle were used at a meeting of the British Association to light up a refreshment tent and its attached garden.

Magnesium was used for another purpose about the year 1878, when Captain Colomb invented an ingenious form of flashing lamp for army and navy signalling. This consisted of a spirit lamp below which was a box containing a mixture of powdered resin, magnesium, and lycopodium. From this box proceeded two bent delivery tubes, the ends of which pointed directly towards the burning wick. Another pipe was also connected with the interior of the box, and this was furnished with a long india-rubber tube crowned with a mouth-piece. For signalling purposes the operator had to blow through this tube, so as to make long or short flashes at will and thus spell out any message by the Morse alphabet.

Soon after the introduction of this flash lamp, which worked most perfectly and would doubtless have come into common use for naval purposes if it had not been superseded by electricity, I made a model lamp of very simple form in order to demonstrate the principle of these short and long flashes at the lecture table. My flash lamp consisted of a wooden rod, two feet long, cut from a broom handle. To the top of this rod I fastened with a single French nail, a piece of sponge, and just below the top I bound on to the rod a penny tin pepper-box. The annexed diagram of the apparatus will make its construction clear. The box was

charged with the flash powder, as in Captain Colomb's lamp, and the sponge was soaked in methylated spirit, squeezed, and then ignited. Holding the rod at arm's length, I then gave it a rapid sweep through the air, with the result that the powder was scattered out from the pepper-box and made a brilliant arc of light. I believe that a torch constructed on this principle would be serviceable in photography, and I threw out the suggestion a short time back in an American photographic publication. The cost of the contrivance is next to nothing, and it will yield a flash of long or short duration, as may be required. With this reference to my rough-and-ready magnesium torch, I will close what may be termed the historical part of my subject.

The revival of the flash-light principle for photographic

purposes seems to be due to Dr. Vogel, who had experimented with a certain powder prepared by Gäedicke, with which he was successful in taking portraits by night. This powder seems to have consisted of a mixture of magnesium, potassic chlorate, and antimonious sulphide. This is a needlessly dangerous mixture, which will not only explode by heat, but, like other compounds containing sulphur and chlorate, will fire with explosive violence by slight friction or percussion. Indeed, a mixture of antimony and chlorate was used in the old days for charging the percussion caps used for small arms. It is not very easy to see what use the sulphur serves in a flash-light mixture, except, perhaps, as an aid to rapid combustion. The chlorate will fire without it, especially if it have a little carbon added to it in the form of powdered loaf sugar. Dr. Piffard, whose name is associated with the revival of the flash-light system in New York, advocated, in a paper read before the Amateur Photographic Society of that city, the use of gunpowder with the magnesium, in the proportion of one volume of the former to four of the latter. I have tried this mixture with very unsatisfactory results, and am certain that most of the powdered metal gets blown away without ignition. The flash is certainly far from being as actinic as one would expect from the quality of magnesium employed, and the smoke given off quickly fills a large room, to the great annoyance of the dwellers therein.

Far better results can be obtained by the use of gun-cotton. The cotton should be of the explosive variety, and of such a quality that when a small tuft of it is placed on the palm of the outstretched hand and ignited, it will flash off without leaving any residue, and will fire so instantaneously that there is no burning sensation to the skin. For flash-light photography about fifteen grains of magnesium should be scattered over a tuft of cotton weighing about ten grains, which has been pulled out so as to cover the largest possible area. The cotton may be placed upon a saucer, or an old tray, and ignited with a long taper. Some have complained that the yellow colour of the flame given by the burning cotton partly neutralizes the actinic quality of that of the magnesium, but I hardly think that this contention is tangible. The cotton is simply used as a convenient means of giving the initial force to the magnesium, which it does both by scattering it in the air, and at the same time igniting it. Whatever kind of flame we use for the purpose, we may assume that to some totally inappreciable extent it may counteract by its colour the actinism of the burning metal. Still, I consider that for other reasons gun-cotton is not the best means of firing magnesium, but its simplicity will always commend it to those who only want to use the light occasionally and may not have more convenient methods readily available.

There is an unwritten law that seems to be scrupulously observed by otherwise unscrupulous traders, which runs thus—"Thou shalt commit adulteration." This law is, unhappily, of such universal application that even magnesium powder has not escaped its influence. Some of its adherents have noticed that magnesium is an expensive metal, and that zinc, which when filed to dust cannot readily be distinguished from it, is conveniently cheap. It is of course only natural that the zinc should by accident get mixed with the magnesium, and confounded with the latter. It is therefore as well that the buyer should be aware of this sophistication, and be careful to go to a trader who is above such dealings. I believe that magnesium wire and ribbon is sometimes alloyed with a small percentage of zinc, so as to correct its natural brittleness, just as our coinage is alloyed with baser metal; with an equally legitimate object, but no such excuse can be pleaded for tampering with the metallic dust, which for flash-light purposes should be as pure as

possible. Magnesium should be kept perfectly dry and in a well corked bottle, for it quickly tarnishes in the air, and when so tarnished it loses much of its radiant quality.

(To be continued.)

Photography in India.

BY MAJOR E. F. BECHER, R.A.

YEARLY, towards autumn, we see in the query columns of the AMATEUR PHOTOGRAPHER inquiries of the photographic capabilities of India and the voyage thereto; though I do not profess to any photographic skill, yet during the last six years I have had some experience of the East and the going to and fro, but only latterly photographically. I must first say that I am a plate-spoiler, as some call it, and not a picture maker; we plate spoilers have lately been so much condemned and we have heard so much about art, pyramids, fog—I mean naturalism—that I am afraid the reader will peruse no more after this confession. But photography to the traveller is what a sketch-book is to the artist, and though we do not make prize pictures, yet our photographic sketch-book is of great interest in after times to ourselves and to our friends.

(1) As to camera.

My own camera was a half-plate Artist's, from the Stereoscopic Company. This is a very handy camera for travelling and rough work, and has stood well. If I were to start again, I should take out with me an ordinary half-plate extension camera, and a quarter-plate hand-camera. I last year bought one of Rouch's Eureka cameras, and am very satisfied with the results. I should recommend a tripod also. Before commencing operations with this camera, remove the back, place a piece of ground glass in the position of the front plate, and focus various objects at various distances, using the slide-out motion; make careful notes of the result, and do not be in a hurry; you will then find that you have a practical knowledge of your instrument. You should also note what the picture looks like in the finder. Another wrinkle connected with this camera is, when you are using it drawn out, to place a finger in the gap, as if you press the shutter knob too hard you are liable to alter the focus. I should say, however, that I do not know how it will stand the hot weather and the rains, as my experience of it was in the cold weather; but from what I know of it, as I have said before, I am very satisfied indeed with it.

Another apparatus I should strongly advise anyone who is going out to remain some time, to take with him, is an optical lantern; a quite good enough one can be obtained for £2 or £3. All bungalows in India are light-colour-washed, so for ordinary occasions you want no screen; you can thus show your friends scenes and episodes much better than by means of prints stuck in a book. I have often worked the lantern whilst sitting in an arm-chair, the lantern on a tea-poy about five feet or so from the wall. You do not want a large picture to exhibit to three or four friends, and I am not at all sure that for these informal shows a small brilliant image is not preferable to a large and, of course, less brilliant one. But Europeans and natives delight in seeing it work. But of course for the latter, the larger image the better. I have quite given up silver printing in favour of slide making, the trouble of printing being at all times immense.

A very frequent query is, "Shall I take out plates and chemicals?" My advice is, take a few, sufficient to make a start with, but for the rest buy your ordinary chemicals in India. Plates I should have sent out by parcel post periodically, similarly ready-sensitised paper, if you use it; but you can buy all things photographic from Kemp, Treacher, Neuberger, etc., in Bombay, Blee at Jubbulpore, and no doubt at Calcutta and Madras; but you can always ascertain this from the advertisement columns of the various papers.

As regards the lantern, if you wish to use the lime-light, you must make the oxygen and hydrogen yourself, you cannot buy it in cylinders in India—at least, in Bombay.

We will now start on the voyage, and here are two maxims I would inculcate:

(1) Never take instantaneous pictures of people in unbecoming attitudes, they not knowing that they are being photographed (unless, of course, you know they will not mind). This is the "arrayism" of photography.

(2) Never take an instantaneous photograph under the awning, in nearly every case the results are most disappointing, in most cases a failure.

I should not attempt to do any developing on board ship; however, if you decide to do so, you will find the bath-room the best place, where there is an unlimited supply of salt water, and a can or so of fresh water can be obtained by asking the bathman for it. If the ship arrives at a convenient hour in Malta, you will have plenty of time to develop some plates in the dark-room of a local, who will allow you to do so for a consideration.

If the bath-room does not suit, from one cause or another, for changing plates, ask one of the ship's officers if he can let you have some place you can darken. You will always find the officers of the ship most willing to do anything they can for you.

An Eclipse changing tent (I think this is the name) is most useful, but if you prefer to change them without, by informing the bath attendant that you want the bath-room darkened at a certain hour you will find it done to a great extent, and you can easily put the finishing touches with rugs, turkey-red (you should have a good large piece with you), etc.; if you use a night-light with your red lantern, do not pack them up with any other property. I did so in my portmanteau, and when I wanted one in the Red Sea I found nothing but the wicks, they had entirely melted away; the results can be imagined.

I have seen queries in the AMATEUR PHOTOGRAPHER, asking, "What sort of subjects shall I find *en route*?" This hardly requires answering; you will find ships, and strange people in strange clothes; land scenes—I can't say landscapes—at your stopping-places, *i.e.*, Gibraltar, Malta, Port Said, and Aden.

You will probably find it convenient to buy photographs at Malta and Port Said; those at the latter place are ridiculously cheap (whole-plate at three for a shilling); you can commit piracy by copying them if you like making lantern slides.

I should have mentioned before this, that I should only have my hand-camera ready for us; my large camera I should either have packed away in my cabin or else in a package labelled "Wanted on voyage." Packages thus marked are put in the baggage-room, and not in the hold, and can be got at any time by applying to the baggage officer, but theoretically they can only be got at on certain days. I should not try any shots in the early morning or in the evening, as the sun rises later and sets earlier in the East than in an English summer, and though everything looks very bright, the actinic power is weak. As regards exposure generally in India, if you treat it as for a bright June day you will be about right; but a little practice is worth much theory, and by trying a plate or two the power of the light can soon be ascertained, but you can't go much wrong if, as I have said, you confine your instantaneous exposures to when the sun is well up, and also if you regard it as an English June. I think the actinic light in India is less.

You must also remember that the complexion of the black man is also non-actinic, and prepare for disappointment in the result if you have made a very rapid shot at close range.

Well, we have disembarked at Bombay. Some of us are soldiers, some civilians, and some tourists. The two former classes will shortly take up their abode in their own bungalows, the latter will pass their time chiefly in hotels and "dak bungalows;" and if they cannot find some local photographer to allow them the use of his dark-room, they must make such shift as they can. When you have settled down in your own bungalow a dark-room is easily contrived.

Only in the large towns will water be found laid on, *e.g.*, Bombay, Poona, etc.; in other places the water is obtained from wells. Every bedroom in India in hotels and bungalows has its separate bath-room. Doors and windows never shut tight, and are always more or less tumble-down. The light inside most bungalows is very feeble; as an example, I printed a couple of photographs to see how the negatives would turn out, and left them on a table close to two windows (most windows open into the verandah). Two or three days afterwards I was toning, and put the above two into the batch; they had not been the least affected by light, the whites were quite pure. But to return to our future dark-room, the bath-room. Bath-rooms are all of one type; a small room with cemented floor, divided unequally by a ridge about eight inches high, the narrower part being covered with matting, the larger part being the water place. In one corner is a hole through the wall for the water to escape; two doors,

one opening into the bungalow, and the other into the verandah, the upper portion of the outer door having *jalousies* in the usual falling-to-pieces condition; a small window, the lower half being wood; the ceiling of canvas, usually with several rents in it; the walls and ceiling whitewashed. To convert, make the landlord repair the ceiling; holes let in dust and dirt. Call in a man from the bazaar to blackwash, or redwash, or yellowwash the inside; buy six or more of the usual porous earthen water jars (*chatty*), and one large one (*ghurra*), about three-foot high, and a couple of tin pots; make your window light-tight by means of brown paper, gum, and tacks, with the exception of the glass. The waste-water hole must also be made light-proof, but it must not be stopped up altogether. Make a small hole in the bottom of the large jar, and put it in the corner where the waste hole is; this is your sink. Range four of your chatties alongside one wall; when filled, this is your water supply; the tin pot is for baling the water out for washing your plates; these chatties being porous keep the water fairly cool, and in the hot weather they require constant changing; a professional photographer gave me this wrinkle, he told me that by doing so he was able to work all through the hot weather without using ice, and this was at Kamptee, one of the hottest places in India. Next use what red or yellow paper you like for your window; the source of light being high (only the upper part, as I have said above, being glass), you will have to use artificial light for developing. If the position of the window does not suit you, you can easily knock a hole somewhere else, and put a pane of glass in; the walls are generally more or less mud; it would only cost about two rupees. Now for your table; this can be a packing case resting on bricks at the corners; the open part facing inwards, you can thus with very little ingenuity make resting places for your trays inside. Newspaper loose on the top, frequently changed, helps towards cleanliness.

Another packing case, but smaller, makes your stool. A curtain over the opening is an improvement, as if at any time you want to leave your dark-room you can put anything likely to be injured by light inside, whilst you open the door; also when making lantern slides, say you have half-a-dozen frames, put them inside the seat-box, light your lamp, and expose them one by one, returning each when it is exposed to this dark box. Another small packing case with a shelf makes your cupboard; this should be fastened to the wall. Another small packing case in the most remote corner for your hypo bath, or else have it inside the bungalow; a camp washing-stand, complete, outside the dark-room, is also very necessary.

The only thing now remaining to do is to darken your doors. You can get cheap, thick red blankets from the Elgin Mills, Cawnpore. Hang one of these inside your outer door, and another outside your inner door. You will want another most probably outside your outer door, but this should not be a permanency, as it would be stolen. This, I think, completes your dark-room. Of course, a little ingenuity modifies many of these arrangements, according to local adaptability.

You can save yourself much trouble by teaching a native boy to do much of the mechanical labour, but teaching him beyond that entails more trouble, I think, than it is worth, especially as he will think himself, *more servitorum*, invaluable, and that you will not discharge him for faults which deserve it. Be prepared in the hot weather to find your water playing you all sorts of tricks, also your solutions; you will find, for example, that without ice, aristotype paper melts away when you attempt to tone. The remarks I have made about the voyage are from a P. and O. or other private line point of view. On board a troopship the case is altered somewhat; the first lieutenant is there the power in the state, and the golden rule for a landsman on board one of H.M. ships is to ask for nothing and ask no questions. A naval officer on shore and one on board a ship are two very different creations.

I will conclude with a few odds and ends as they occur to me.

There is a photographic society at Calcutta. There are art exhibitions at Bombay, Poona, Calcutta, and elsewhere, where photographs can be exhibited.

Water, especially from wells, is liable to have much sand in it, so the necessary precautions must be taken. A tin still can be bought at any large chemist's, *i.e.*, Treacher or Kemp, at Bombay, price about Rs. 12. It is best to distil water at night, as thus the water in the condenser is cooler. There is no difficulty in getting ice at most stations.

One of the first things a photographer wishes to photograph

in India is his various horses and ponies. I have found that I have got the prettiest and best pictures by having the subject led down to a river or tank (there is generally one close by), and making him stand either at the edge or in the water. Most Arabs when not excited stand like cows, another horse or pony (a stranger for choice) somewhere near the subject generally makes him show himself off.

Ordinary wooden negative boxes are a great waste of bulk; plate boxes save much room for storing negatives. I do not recommend vulcanite dishes, the heat cracks them.

I have almost forgotten one most important power in the East, that is the white ant. Let nothing of any value remain on the floor, especially in the dark-room, for any length of time. Your developing box-table should rest on bricks; glass, however, is the only medium which baffles the climbing powers of white ants, and therefore bottles are preferable to bricks, but the latter avail to a certain extent.

There is generally more or less dust in the air during the day, so precautions should be taken when negatives are drying.

Blackwood's Photographic Lens.

THE improvement in photographic lenses which Mr. Hugh Blackwood has patented consists in the use of an extra lens placed just in front of the rear lens, or it may be inserted in the stop itself, different sizes and strengths being thus optional. This extra lens, by preference, consists of a bi-convex and a bi-concave, which may be cemented together and arranged with a small air space between; the later arrangement is preferred, as a stronger or weaker glass can be used according to the effect it is desired to produce. By the addition of stronger bi-convex lenses, the focal length may be shortened down to such an extent that the sensitised plate may almost touch the lens. The glasses which the patentee employs are ordinary eye-glasses, that can be purchased for a small sum almost anywhere. The strength of glasses found most suitable varies from No. 5 to 16 (French numbers), according to the class of lens to be used; thus, for a whole-plate rapid rectilinear, or half-plate Lancaster's meniscus lens, Nos. 7 or 8 are most suitable, while for a portrait lens the strength may vary from No. 5 to 16, according to results required. By the addition of the extra lens a narrow-angle Ross or other maker's narrow-angle lens is converted into a wide-angle; while a Dallmeyer or other maker's wide angle lens may be converted into a narrow angle of any required degree by substitution of a stronger bi-concave. Also, if objects at a great distance are to be photographed (say from the top of a hill), flatness of field, depth of focus, with a large stop or orifice enabling instantaneous effects, will be attained. A Voigtlander or other portrait lens becomes, by addition of the extra lens, applicable for all known purposes, as the good quality previously sacrificed to get the greatest possible rapidity are regained. Similarly any ordinary lens becomes increasingly efficient for purposes of enlargements. The patentee also finds that with lenses of Dallmeyer, Ross, Lancaster, and other well-known makers his adaptation produces greatly improved results.

With many meniscus lenses, by the addition of one bi-convex glass of No. 8 strength, he obtains rapidity, shortness of focal length, width of angle, clear definition, and flatness of field, but in most cases he prefers to use the compound lens. Similarly with an addition of one No. 1 or 2 short-sighted eye-glasses inserted in the stop, an ordinary quarter-plate portrait lens will cover a three-quarter, or 7 by 5½ inch, plate at the same focal length, viz., 6½ inch as before, with a large ¼ inch stop, yet with flatness of field, depth of focus; or a Dallmeyer 2 C lens will cover from a whole plate to a 12 by 10 plate with a larger stop than at present, attaining also increased rapidity and brilliant effect. In all cases a diaphragm will be placed between the extra lens and the rear lens in the combination.—*English Mechanic*.

Science Notes.

It is the good (or bad?) fortune of the writer to be required monthly to catalogue the contents of some hundreds of periodicals, transactions, journals of learned societies, etc. These frequently contain matter of interest to the photographer; and in these notes it is proposed to cull from their pages such items as it is thought will interest the readers of the AMATEUR PHOTOGRAPHER.

The new Midland "city" possesses a monthly publication, entitled *Birmingham Faces and Places*, which is in its way producing a photographic survey of the "hardware village" and its neighbourhood. All the illustrations (half-a-dozen each month) are from photographs, and are reproduced, whole-plate size, by Sprague's "ink-photo" process. The price is sixpence, and the publishers are Messrs. Hammond and Co., Scotland Passage Birmingham.

At a meeting of the Royal Meteorological Society on February 19th, Captain D. Wilson-Barker exhibited a number of photographs in illustration of his paper on "Cloud Nomenclature." He includes all clouds under two heads: (1) cumulus, and (2) stratus but makes elaborate subdivisions of each.

At the same meeting Mr. E. S. Bruce read a paper on "An Optical Feature of the Lightning Flash." He referred to the report of the Thunderstorm Committee, in which it is stated that there is not the slightest evidence in the photographs of lightning flashes of the angular zigzag or forked forms commonly seen in pictures. The author, however, believes that this is an optical reality, as the clouds on which the projection of the flash is cast are often of the cumulus type, which afford an angular surface. In support of this theory he exhibited some lantern slides of lightning playing over clouds.

Photographers know well that the human eye is most sensitive to yellow light. M. Raphael Dubois (Paris Academy of Sciences) finds that the blind animals which inhabit the grottos of Carniola have skins which are sensitive to light, and that in their case also it is yellow light which affects them most readily.

The new printing process invented by Dr. Nicol, of the Mason College, Birmingham, is based upon the work done by Herschel and Hunt more than forty years ago. Dr. Nicol uses certain salts of iron spread upon paper to obtain a weak image, and this is then developed with nitrate of silver. The company which will work the process proposes to call it "Kalotype" a name too near Fox-Talbot's famous "calotype" process to be a good one.

Those who love to photograph our cathedrals should study the capital articles on them which have appeared during the last year or two in the *Century Magazine*. The March number contains Gloucester Cathedral, described by Mrs. Schuyler van Rensselaer, with drawings by Joseph Pennell.

The *Moniteur de la Photographie* gives a method of compounding a magnesium mixture which will produce, when burning, a light equal to twenty thousand candles:—

Magnesium powder	..	..	5 ozs.
Barium nitrate	..	..	7½ "
Flowers of sulphur	..	..	1 oz.
Beef suet	..	..	1¼ "

The suet is melted and kneaded up with the other ingredients into a paste, which is then placed in metal saucers (zinc, etc.) about 3 ins. in diameter. Each saucer or case should hold about one pound of the mixture. This will give a light which lasts for twenty seconds, and can be seen at a distance of sixty miles. For photographing crowds at night, fires, etc., this would be a useful light.

The February number of that excellent magazine, *St. Nicholas*, has an article on "Football," which has some capital illustrations done by instantaneous photography, and reproduced by the Meisenbach process or some modification of it. F. G. S.

DR. M. ANDRESEN, of Berlin, has taken out a patent in this country for developing photographic prints on coatings of chloride, bromide, or iodide of silver by treating them in a developing bath containing diamido-naphthalene, amido-naphthol, or dioxynaphthalene, or their sulpho-acids. He says that these substances are exceptionally suitable for developing photographic pictures.

Our Contemporaries at Home and Abroad.

Anthony's Photographic Bulletin (New York), in an article on "Stained Negatives," says, "From what we have said, it is evident that by far the greater number of stains upon negatives are the result of faults in manipulation; but occasionally they come from accidents. . . . Careful manipulations and a strict following of the directions given for the development and fixing of the plates will give negatives free from stain." Articles: "Chemistry of Uranium," "The Eyes in Flash-Light Photography," "The Coloured Screen in Photo-Micrography," "Reducing of Negatives and Positives, and other Properties of the Acid Fixing Bath," "An Amateur Photographer on the Nile and in the Desert of Sinai," etc.

British Journal of Photography, speaking of toning solutions, says, "The best method of preparing the solution (chloride of gold) is to keep it not weaker than, say, a grain to the drachm, and only when wanted for use to add the chalk or other neutraliser to the required amount of strong solution, then to filter after shaking a few times, and, finally, to add the acetate or other alkaline salt. If the chalk be added to a weak solution, say a grain to the ounce, the acidity is less readily counteracted, and there is risk of over-haste, leading to the concoction of a defective toning bath." Articles: "Celluloid and Electricity," "Scott's Warm Air Saturator," "Enamelled Coloured Prints," "Film Photography," "Scale of Focussing Hand Cameras," "Eikonogen as a Developer in Practice," etc.

Photographic News says, "The latest use of photography in medical science is seen in a new medical publication. The author of a paper on the peptones made some experiments as to the power of various pepsins in digesting albumen, and, desirous of showing his readers the results, he had the flasks in which the experiments were made photographed, and the photographs reproduced for publication. The pictures show the exact relation and proportion of the various residues, and lay the experiments before the mind in a very vivid way. The idea is a capital one, and is capable of much expansion." Articles: "Detective Cameras," "A Machine Camera Taking Ten Photographs a Second," "An Old Photographic Book," "Platinum and Palladium Toning," "Hinges of Dark Slide Shutters," "A New Lithographic Transfer Ink," etc.

The *Photographer* (Glasgow) says, "Apart from any 'photographic' risks, the usual rate of insurance upon any building (or its contents) constructed of wood and glass is 5s. for £100. Greenhouses and conservatories, heated by hot-water pipes or hot-air flues, are perhaps the simplest illustration of such class of risk, and this may be taken as a fair 'normal rate' to start upon, and I doubt if any good office would object to accept such a rate if there were no further complications, in the shape of fire stoves, joint tenants, or any large stock kept of collodion, alcohol, or ether." Articles: "Dry Plate Photography for Beginners," "Out of the Past," "The Practical Printer," etc.

The *Photographic Art Journal* contains a print from Dr. Emerson's "Great Yarmouth Harbour," photo-etched by himself. In an article on "When to Abstain," it says, "Let the first impression of a picture, the original motive, come direct from Nature. This is better than sitting at home and inventing a subject or reading a passage from some pastoral poem and then setting about making it up. It will then indeed be surprising if you escape conventionality and formality in the result. 'Go forth into the light of things,' and in a submissive mood let Nature be the teacher, and having caught at her suggestion, then work it out in sympathetic and conscientious spirit, and rest assured that there are those about you who when they see your picture will not fail to recognise its truthfulness and beauty." Articles: "Intensification," "Proposed Photographic Survey of Warwickshire," "Control in the Density of Negatives," "One or Two of the Tenets of the Naturalists," "The New Rollable Celluloid Film," etc.

The *Photographic Times* (New York), in an article on "Printing on Plain Paper," says, "A combined gold and hypo bath tones plain paper very well, but requires a much longer time to accomplish the desired result. The following formula is a good one: Dissolve 15 grs. of pure terchloride of gold in $7\frac{1}{2}$ ozs. of water, and add it drop by drop, accompanied by continuous stirring, to a solution of 2 ozs. of hyposulphite of soda in 12 ozs. of water. Take 3 ozs. of this stock solution, and mix with 15 ozs.

of a 10 per cent. hypo solution, adding 15 grs. of freshly precipitated chloride of silver. Tone the prints without previous washing, and they will acquire a beautiful shade which is permanent." Articles: "Photo Engraving by Electricity," "The Natural in Photography," "Improved Means of Filtering Thick Liquids," "A Simple Apparatus for Generating Oxygen," "Platinum Toning," etc.

Photography, in an article on "Originality," says, "Sentimentally, this lack of originality has been deplored many times, but we think it ought to receive sterner recognition, if not in exhibition rules and conditions, then at the hands of the judges. For while we may advantageously glean ideas and suggestions from fine art engravings and from the works of our best artists, yet to degrade photography to mere copying must be fought against to the utmost by alert and watchful judges." And in another on "The Monochromatic Rendering of Colours," it says, "By using plates which are called Isochromatic, but are not so in the literal sense of the word, we arrive at results which are truer than when an ordinary plate is employed, and by cutting off the violet we come nearer to the truth. Photography is full of dodges, and this last is amongst the most scientific of them; but the aim of experimenting should be gradually to simplify all processes to the utmost, and make them beyond the power of tampering with, and getting sporadic results which are looked upon as triumphs of genius, whereas they frequently are the outcome of some lucky hit which can seldom be repeated, owing to some small difference in the manipulations of apparatus employed." Articles: "A Memorandum Camera," "Palladium Toning," "Professor Muybridge at Manchester," etc.

The *Journal of the Photographic Society of Great Britain* for February 21st contains the report of the Council and statement of accounts for the past year, which shows a balance of £794 12s. 1d. It also contains a paper on "The Establishment of a Central Institute of Photography in connection with the Photographic Society of Great Britain," and on "An Example of an Effect of the Hinges of Dark-Slide Shutters on Gelatine Plates," an account of the annual dinner, and a notice of the late Mr. J. R. Sawyer.

Bulletin de la Société Française de Photographie (Paris) contains the proceedings of the society at its sitting on the 7th ult., in the course of which it was announced that Mr. Vogel, jun., had sought the cause of the black edges which were frequently found round the edges of commercial gelatine-bromide plates. The phenomenon is due to the black paper used for packing them. Traces of hyposulphite of soda have been found in the paper, which evidently proved the use of paste treated with anti-chlorine, or of colouring matters containing that salt.

“Thursday Evenings” at the Camera Club.

BY ONE OF OUR STAFF.

MR. CHARTERS WHITE was very appropriately the Chairman at the meeting of the Club on the 27th ult., when the subject for consideration was "Photography as applied to Medicine and Surgery." The subject was a somewhat difficult one to treat, in the sense that it is a comparatively recent innovation into the realms of the art, but from the facts placed before the meeting by Dr. Patterson, who provided the remarkably able paper on the subject, it is likely soon to occupy a large and important place in both branches of the healing profession. In a paper, by no means without humorous touches, the doctor traced out the history of medical photography from the time of Dr. Wright, who, in 1863, made the first essay on the subject, and in 1867 read a paper before the Photographic Society of Great Britain on the subject of "Photography as applied to Medicine and Surgery." The lecture was illustrated by a large number of slides by Mr. Pringle and Mr. Andree, thrown on the screen, and though they were not pictures of the most attractive subjects that could be found, they considerably added to the interest of the lecture. I must not omit to mention the high tribute paid to Mr. Pringle's slides by the lecturer, who said that they were perfect, in some cases, giving a better idea of the subject matter than the microscopical preparations themselves. Unfortunately, all lantern-slide makers are not Andrew Pringles, but there can be no doubt, as was pointed out, that, with a little care in the preparation of the

slides and in the development of the negatives from which they are made, photography will be made a most valuable assistant in the demonstrating theatre. Probably this will be its chief work, but it was also pointed out that it would be extremely useful for taking frequent photographs of various diseases, malformations, and so on, to enable the medical man to trace the progress of the cure or otherwise, and to make records for future reference in cases of peculiar or rare cases. In *post-mortem* cases it would be useful to make permanent the appearance of any organ before dissection, when it would really prove itself invaluable, there being no time for a skilled draughtsman to make a sketch. Photographs, properly taken, too, would have the great advantage of being absolutely accurate, none of the details being consciously or unconsciously exaggerated in accordance with the draughtsman's prejudices and predilections—a state of things which had in numerous cases rendered the drawings absolutely useless as correct records. It would be useful for recording the form of bacteria and bacillus (and here pictures of the cholera virus and anthrax were thrown on the screen) for purposes of comparison. In medicine it would record expressions, waste, overgrowth, and the course of various diseases, and by the use of colour-correct plates would give absolutely correct views of skin diseases which had now to be painted by hand to have the same effect. It would be most useful for the purposes of consultation, where several views of the parts in tape measures laid on them could be sent to the consulting physician, and advice given, and even in some cases the course of the operation correctly marked on the picture. Some pictures taken in the Lower Congo district by Mr. Andreæ, of the legs of some natives suffering from a peculiar kind of ulceration, were sent to Europe for consultation purposes with every success. The learned doctor, in the course of his remarks, said there ought to be provided in every hospital, facilities for making scientific records by means of photography. At present the results of medical photography were very poor, and the hospital authorities seemed to think that if they provided a camera they had done all that was necessary. That was not so. Proper apparatus and facilities should be provided, and the students should have some training in photography for the purposes of their profession.

The Chairman was delighted with the paper, and was firmly convinced that the photograph would in the near future be much used, because of the great facility it gave of demonstrating anatomical, physiological, and pathological subjects to a class.

Mr. Pringle believed there was not a word in the paper with which he could not cordially agree. Dr. Watson Cheyne had been photographing many of his patients in King's College Hospital, and during that week he was giving before the Royal College of Surgeons three lectures, illustrated by lantern-slides, on microbe pathology, a thing which had never before occurred. The time was coming when every medical school would have its photographic method of demonstration, and be provided with an optical lantern and screen. The Royal College of Veterinary Surgeons had given an order for the best possible optical lantern and apparatus. Men of average ability would be able with a little training to produce low and medium power photo-micrographs, but it would take a long training to produce high-power negatives. He emphasised the use of colour-correct plates, which were necessary to give the relative values of the respective colours of the tissues, especially in inflammatory skin diseases, though, happily, a screen was by no means necessary where they were working indoors.

Mr. Elder said they had set up a dark-room at Bartholomew's, and Dr. Patterson gave the names of several other hospitals where photography was being taken up.

Several other speakers followed, and the proceedings terminated with a vote of thanks to the reader of the paper.

AMATEUR PHOTOGRAPHIC SOCIETY FOR EXETER.—On the 27th ult. a meeting of Exeter gentlemen interested in amateur photography was held at the New London Hotel with a view to forming a society. Dr. Cheese was voted to the chair, and said the idea originated with Mr. Damant, a young gentleman from London, who found Exeter without an amateur photographic society, and thought such an important place ought to have one. After a conversation, Dr. Cheese, Messrs. Damant, Honey, Browning, and Lake, with Rev. J. Sparshatt as Hon. Secretary *pro tem.*, were appointed a committee to draw up rules. Nineteen present signified their intention of joining the Society, and the annual subscription was fixed at 7s. 6d. The Chairman thought, for a first meeting, the results were very gratifying.

Societies' Meetings.

BATH PHOT. SOC.—The annual meeting of this flourishing Society was held on February 25th, at the Royal Literary and Scientific Institution. The President, Mr. W. Pumphrey, was in the chair. The Treasurer's balance-sheet was produced; it showed a balance in favour of the Society, and was in all respects a most satisfactory one. The Hon. Secretary, Mr. W. Middleton Ashman, read a most carefully prepared and exhaustive report which showed that fourteen meetings had been held, at each of which a paper had been read or a demonstration given; there had been several excursions made which had all yielded good work. During the past year the numerical strength had increased by leaps and bounds, and a most commodious dark-room had been built. The Society had the nucleus of a good library, and, thanks to the kindness of Mr. C. H. Talbot, they possessed historic relics of his late father. The report pointed out that to Bath really belonged the honour of the discovery of practical photography, Fox Talbot's process ante-dating that of Daguerre by eighteen months. The President, Vice-President, and Committee were re-appointed, as was also Mr. W. Middleton Ashman as Hon. Secretary and Treasurer, a warm vote of thanks being accorded the latter on the motion of Mr. G. F. Powell. Mr. Friese Greene then read a paper on "Photography in an Age of Movement," and during the evening a new detective camera and other apparatus were exhibited.

BRIXTON AND CLAPHAM CAMERA CLUB.—The last meeting of this club was held on Friday, the 28th ult. A set of slides to the number of 180 was lent by the Editor of *Photography*. These were the medalled pictures in a recent competition, and comprised some capital specimens of work, especially in the landscape, instantaneous, and animal classes. The exhibition of these by the oxy-hydrogen lantern afforded a good evening's entertainment to the members and their friends. Next meeting, 14th inst., a paper by Mr. Bartrop on "Enlarging."

CARDIFF AMAT. PHOT. SOC.—The usual weekly meeting was held at the studio on the 26th ult., Mr. C. Lewis occupying the chair. There was a large attendance of members and their friends, the occasion being rendered interesting by an instructive lecture by Mr. Josty on "Home Portraiture," illustrated by models of studios. As the lecturer's remarks and advice applied more particularly to amateurs, the studios referred to were so constructed as to be portable, commencing with the humble back-yard arrangement, at a cost of a few shillings, to the elaborate lawn studio. A special feature was the model of "Josty's Movable Studio" working on a centre and four wheels, thus being in a position to always command a good light, in contradistinction to the fixed studio and movable curtains. The model was carefully inspected; and during the discussion Mr. Josty completed his lecture with a humorous description of men he had known in the photographic world, and his experiences generally, both home and continental.

CROYDON CAMERA CLUB.—A crowded and enthusiastic meeting of the supporters of the above club was held on Tuesday, 25th ult., at the Croydon Public Hall, under the presidency of Mr. H. Maclean, F.G.S. The Chairman having made a lengthy speech, in which he clearly and fully explained the support which had been promised, the advantages which the society offers, and the steps which it is proposed to take, announced the kind offer made by the Editors of the *AMATEUR PHOTOGRAPHER* to place their Silver and Bronze Medals at the society's disposal, which intimation was received with much applause. Mr. E. F. Smither moved, and Mr. A. E. Sergeant seconded a resolution, "That it is desirable to form a photographic society for Croydon." This was carried *nem. con.* The subscription was fixed at 10s. 6d.; the Committee to have the power to charge an entrance fee after 1st June. A *pro tem.* Committee was formed as follows: H. Maclean, W. T. Barker, E. F. Smither, G. Isaacs, L. De Clercq, A. Isaacs, W. J. Bishop, and M. Plimmer. Mr. De Clercq proposed that a hearty vote of thanks be accorded to Mr. Maclean for his skill and energy in organising the society, and for the efficient and urbane manner in which he had presided over the meeting. This was carried amid loud applause, and the gathering soon after adjourned until the 30th of March. Between thirty and forty gentlemen have offered themselves for election. Those desirous of joining should communicate with Mr. Maclean, Birdhurst Road, Croydon, or with any of the members of the *pro tem.* Committee.

DARLINGTON PHOT. SOC.:—The third annual conversazione and exhibition of the above Society was held in the Mechanics' Hall, on the 21st ult. The photographs sent in for competition showed, both artistically and technically, great merit. There were also on view a number of very fine enlargements, being prizes won by members in previous years. After a short speech of welcome from the President, Mr. E. Ensor, B.A., a number of excellent lantern slides made by the members were thrown on the screen by means of a powerful lantern, manipulated by Mr. R. A. Luck, which proved a most pleasing feature of the evening's entertainment. The list of awards, which was read by the Hon. Secretary, Mr. W. Garritte Brewis, was as follows:—For the best frame of six photographs—first, Mr. E. Ensor; second, Mr. T. Howlett. The AMATEUR PHOTOGRAPHER'S Bronze Medal for the best single picture in the Exhibition was also awarded to Mr. T. Howlett. For the best six lantern slides—first, Rev. C. G. Davis; second, Mr. P. J. Cooper.

HACKNEY PHOT. SOC.:—The exhibition on the 27th was a great success, being very largely attended. During the evening Mr. Hubert took a flash-light group with his new oxygen blow-through lamps. The exhibitors, in addition to the members' apparatus and work, were Messrs. Marion, who showed their latest novelties, Greenall's shutter being much appreciated; Watson and Sons, Acme camera and detective camera; Mawson and Swan, detective camera, the Giah; Abraham, shutter, lamps, etc., and the Ideal detective camera; Doublet, lanterns and accessories; Britannia Works, Ilford, Alpha and bromide work; Edwards, transparencies, prints, and isochromatic plates. Dr. Roland Smith, in the absence of the President through illness, opened the exhibition, and expressed the hope that it would prove instructive. He announced that Mr. J. Traill Taylor would give the next paper, on "Photographic Optics," on the 13th of March.

HOLBORN CAMERA CLUB.—The monthly lantern night was held on Friday, February 28th, when the Illustrated Boston lantern slides were shown. On Saturday, March 1st, the Club held their annual Cinderella dance and exhibition of pictures and lantern slides at Anderton's Hotel. At half-past 9 the prize winners were announced: Class 1, whole-plate and over: 1st, F. W. Edwards; 2nd, J. Brocas; 3rd, F. J. Cobb. Class 2, half-plate and under: 1st, H. Beckford; 2nd, R. Luxton; 3rd, N. Baker. Class 3, lantern slides: 1st, H. Beckford; 2nd, E. H. Bayston; 3rd, W. Chang. Class 4, best set of six prints by a lady member: Mrs. J. E. Smith. Several flash-light pictures were taken during the evening by Messrs. Chang, Cobb, and Bayston. Shortly after midnight, about thirty-five members proceeded to the residence of Mr. and Mrs. Dear (two most enthusiastic amateurs), who had kindly invited them to supper, during which a flash-light picture was taken, and print of same passed round before conclusion of the meal. The remainder of the evening was pleasantly spent.

LEEDS Y.M.C.A. PHOT. CLUB.—The third annual meeting of the above Club was held in the Society's Rooms, 13, South Parade, on Monday, the 3rd inst. There was a good attendance of members present, and new members admitted, the fee being, members of the association, 2s. 6d.; non-members of the association, 3s. 6d. On the appointment of officers Mr. Godfrey Bingley was unanimously re-elected President, Mr. J. A. Noble and F. Scaife Vice-Presidents, Mr. F. W. Fisher Hon. Secretary, and Mr. H. Eastwood Librarian. The remainder of the evening being spent with the lantern, some very excellent slides were shown by Mr. G. Bingley, F. Plews, T. Gaines, and F. W. Fisher.

LEITH AM. PHOT. SOC.:—On the 25th ult. the members of this Society gave a popular exhibition of their work in Junction Street Hall, which was crowded. Mr. Dewar presided, and said that during the past year the Society had increased its membership to 50, and it was encouraging to know that they had a number of lady members. Besides the usual monthly meetings, they had had several excursions, the results of which would be exhibited on the screen that evening. Over 200 specimens were exhibited, most of which showed remarkable taste and care in development. Mr. Guthrie, Secretary of the Society, has been successful in carrying off the only prize presented by the AMATEUR PHOTOGRAPHER for the best piece of amateur work in landscape, *i.e.*, "Inland Scenery."

LIVERPOOL AMAT. PHOT. ASSOC.:—The second ordinary meeting of the twenty-seventh session was held on Thursday, the 27th February, in the Public Sale Room of the Lancashire and

Yorkshire Railway Company, Tithebarn Street. The President, Mr. Paul Lange, occupied the chair, and there was a large attendance of members and their friends. The Chairman announced that Mr. Edward M. Tunstall had been appointed Hon. Secretary in the place of Mr. Walter Hughes. The attention of members was drawn to the extra meeting to be held at the City Hall, Eberle Street, on Thursday, 20th March, for which evening a concert was being arranged by Messrs. A. Jr. Cleaver and F. K. Glazebrook, to form the first part of the programme, and after which the President would conclude with his illustrated lecture on "Norway." The President also announced that the Council had arranged for a series of practical demonstrations in photography for the special benefit of beginners, to be given in the Club Rooms, 3, Lord Street, fortnightly. The Council had also arranged to exhibit the pictures (sixty in number), 15 by 12, of Mr. H. Tolley, the gold medallist, of Nottingham; these would be on exhibition for a short period in the Club Rooms. Mr. Benj. J. Sayce then submitted a most ingenious hand camera made at a very trifling cost, and meeting all the requirements of the amateur photographer. Other business being concluded, the general public gained admittance, and Mr. D. Lewis gave his paper on "A Fortnight in the Netherlands with a Camera," followed at 8 o'clock by Mr. W. P. Christian, with "Moor and Don, or Studies in Algeria and Spain;" both lectures were illustrated with Messrs. Archer's powerful oxy-hydrogen limelight lantern. The Manchester lantern competition slides, kindly lent to the Association, were then exhibited.

LIVERPOOL UNIVERSITY COLLEGE PHOT. SOC.:—The meeting of members was held on the 26th ult., Dr. Kohn, the President, in the chair. Mr. Paul Lange, one of the Vice-Presidents of the Society, read a paper on "Detective Cameras." The various working parts of a detective or hand camera were explained, and shown on a camera made by Swinden and Earp. A hand camera, Mr. Lange said, should be used for obtaining pictures suitable for lantern slides or enlargements, and the most convenient sized camera for this is one taking a 5 by 4 picture. The lens, which the lecturer said was the most important part, should be of the best quality, of medium focus, and for 5 by 4 work a half plate lens should be used. The shutter was the next part to be considered, and the more rapidly this worked the better was the result. Metal work shutters were objectionable, especially for sea work, and the Kershaw principle was said to be the best. As regards plates, Mr. Lange said he used the Ilford ordinary (yellow label), and the developer he employed was the washing-soda one—the pyrogallol he added dry. This gave a greenish negative, and one not very nice to look at, but one giving splendid prints, especially platinotypes. The plates he backed with red paper, and by this means he avoided loose paper in packing the plates, and also kept his plates in better condition. Mr. Lange exhibited some fifty of his best slides by the limelight lantern.

LUTON AND DISTRICT PHOT. SOC.:—A successful meeting was held on the 24th ult. There was quite a large show of apparatus, and many prints by members, from 25 by 20 down to quarter plate. Messrs. Carruthers, Percival, Boutwood, and Morrison contributing platinotype, and Wardill, Howard, Davis, Roberts, and Bunyan silver prints. Mr. H. Edwards showed bromide enlargements, and Mr. Davis a number of stereoscopic views. Instrumental music was given at intervals during the evening. Owing to the lengthy programme, Mr. A. W. Howard's paper had to be postponed.

NORTH MIDDLESEX PHOT. CLUB.—On Monday, February 24th, Mr. G. Davison delivered a lecture upon "Pictures by Photography," illustrating it by about one hundred photographs taken by himself. After speaking of the advances that photography had made, and the restrictions which it imposed, he proceeded to review what are generally considered the rules of art, and remarked that exceptions to these were almost as much the practice as not among the best photographers, and instanced Mr. Robinson and others, who had taken some of their best pictures with the sun in front of the camera in direct contradiction to one of the best known rules. Again, another rule was that the horizon line should not be in the centre of the picture; this and many other rules he referred to, and had one or more pictures; to prove that they might sometimes be departed from, and advised that the simplest subjects be chosen, namely, those with as little in them as possible, so that the interest might be centered upon the principal feature, and to

endeavour to introduce originality and boldness into their pictures. He then referred to the faults to be avoided, and the merits to be sought, giving force to his words by a photograph showing that particular feature. The whole lecture was given in such an interesting manner, and was of such a practical nature, that few could go away without having learnt something. A hearty vote of thanks to Mr. Davison concluded the evening. Monday, March 10th, members' lantern night. Visitors invited; ladies admitted.

ROSSENDALE PHOT. ASSOC.:—On the 24th ult. *Photography* slides were exhibited, the President occupying the chair. Mr. S. Compston, with his oxy-hydrogen lantern, fulfilled the duties of exhibitor in a commendable manner. The usual votes of thanks terminated the proceedings.

PERTSHIRE SOC. OF NATURAL SCIENCE (PHOT. SECT.):—A meeting of the section was held on Saturday, March 1st, at 8 p.m., Mr. J. W. Munro, B.A., the President, in the chair. The minutes of the last meeting were read and approved, and the gift of a copy of W. K. Burton's "Photographic and Photo-mechanical Printing Processes," from his brother, Mr. Cosmo Burton, B.Sc., was announced. Mr. W. Frew, F.C.S., then read a paper on "Detective Cameras," in which he described the construction and use of such cameras. The paper was illustrated by cameras from Marion and Co., Fry and Co., and Messrs. Lowdon, of Dundee, and by specimens of work done by them. A display of lantern slides then took place, the contributors being Messrs. Ellison, Frew, and Reid, of University College, Dundee, and Fry and Co. The meeting was closed by votes of thanks to Mr. Frew, Mr. Burton for his gift to the section, and to the Chairman.

SHEFFIELD CAMERA CLUB.—The first soirée in connection with this Club has been held. A considerable quantity of photographic apparatus was displayed. Messrs. Marion and Co. and R. and J. Beck, of London, contributing lenses, and the Eastman Company furnishing some very interesting enlargements. The President, in the course of a short address, referred to the origin of the Club, and said some of the members when they joined were novices in the art, but others were men of great experience and ability, ready at all times to give advice and valuable help to the recruits. In their Club the professional element did not enter, not that he would say one word in disparagement of the professional photographer; but he felt strongly that a society could not do well which had both the professional and amateur within its ranks. To the *AMATEUR PHOTOGRAPHER* was due the credit for the great and rapid advancement of the art of photography during the last few years. During the evening Mr. Winder, with the aid of a lantern, showed some of the members' slides; piano solos and songs were rendered, and Mr. R. Watts gave some humorous recitations. A flash-light photograph of a group of ladies and gentlemen was also taken by Professor Arnold.

WEST SURREY AM. PHOT. SOC.:—A meeting was held at Crichton Hall, Clapham Junction, on the 26th ult., and was devoted to an exhibition of slides upon the screen by the oxy-hydrogen light. Messrs. Davison, Lyell, Squire, Bradley, Graham, Miall, and other members brought transparencies, and in addition the Society is indebted to the Editors of the *AMATEUR PHOTOGRAPHER*, who kindly sent down a parcel of about 100. The same paper also had on exhibition the "Enlargements" sent in to one of their competitions, and they were much admired. Several gentlemen have joined the Society since it moved into its new quarters, and at the conclusion of this meeting fresh names were handed in.

WEST LONDON PHOT. SOC.:—At the ordinary meeting Mr. G. F. Blackwood presided. The Chairman called upon Mr. Charles Dixon for his paper on "Holland House," the Secretary (Mr. Hodges) operating the lantern. The paper, which was of a very interesting and instructive nature, was prefaced by a short description of the process employed in the production of the slides. They were, with the exception of a few on chloride dry plates, all produced by the wet collodion process, by reduction in the camera from 9 by 7 negatives, which were also produced by the same method of production. In the case of some of the interiors, exposures of two hours had been given, the plates being backed with wet blotting paper to keep the films moist. The lecturer then traced the history of the house from the time it came into the possession of the Holland family in 1600 down to the present time, illustrating his remarks with a large

number of interior and exterior views of the house, and of the park and grounds. A vote of thanks having been accorded to Mr. Dixon and the Secretary, Mr. Wilson formally presented the Society with a number of photographic works of reference as a nucleus for the formation of the Society's library. The Secretary suggested the appointment of a Librarian, and invited members to volunteer for the office. After some discussion it was decided to refer the appointment of the Librarian to the Council for further consideration. The next ordinary meeting will be held on the 14th March, when Mr. H. Selby will read a paper on "Stripping Films."

Exhibitions.

EXHIBITION AT KIDDERMINSTER.

THE Worcestershire Camera Club (established in 1888; present number of members, 63) opened their first exhibition of photographs in the Museum and Art Gallery, Kidderminster, on March 1st. About 250 frames are hung on the walls of the excellently-lighted gallery, while in the museum below, lantern slides will be exhibited on three evenings in each week, and there is a selection of apparatus shown by Mr. R. Jenkins, of Mill Street, Kidderminster.

Medals and prizes were offered in sixteen open classes, and in six classes restricted to members of the Club. But Class XII., for pictures illustrating "The Vicar and his Guests" (offered by *Photography*), and Class XXII. (pictures from negatives on Fry's plates) failed to attract any competitors.

The judges were Mr. Charles W. Hastings (of the *AMATEUR PHOTOGRAPHER*) and Mr. W. Jerome Harrison, F.G.S. (Major Nott, who had promised to assist, being called abroad was prevented from attending), and their awards were as follows:—

Class I. (Professional Portraiture).—Silver medal to Harold Baker, of Birmingham; bronze to T. G. Whaite. A good class, including 35 frames, and some fine work by Byrne, Draycott, R. H. Lord, Dew, Beaufort, etc.

Class II. (Landscape or Seascape, professionals).—Silver medal to J. P. Gibson; bronze to E. Greaves.

Class III. (Landscape or Seascape, amateurs).—Silver medal to J. W. Charlesworth, for three exquisite views in Whitby, of which "Now Came Still Evening on" is most pleasing; bronze to J. K. West for "Views on the Dart."

Class IV. (Prints from Ilford plates).—Silver medal to Clarence James for three fine cloud effects; bronze to J. E. Austin.

Class V. (Genre, professionals).—Silver medal to F. Whaley, for print in red chalk, "Can a Mother's Tender Care Cease towards the Child she Bare?" bronze to W. W. Winter, for "Look, Mamma!" Messrs. Anckorn, Greaves, and J. P. Gibson also send good work.

Class VI. (Genre, amateurs).—Silver medal to R. S. Redfield, of Philadelphia, for "Hesitation," a boy about to bathe; bronze to A. M. Morrison, for "Pastoral Studies." A very good class, including work by C. S. Roe, T. M. Brownrigg, J. L. Austin, G. Brightman, A. R. Dresser, E. C. Middleton, etc.

Class VII. (Enlargements, professionals).—Silver medal to T. G. Whaite, for "Dinant Cathedral;" bronze to F. Whaley, "Sunset on the Don."

Class VIII. (Enlargements, amateur).—Silver medal to W. H. Kitchin, for "Leopard;" bronze to H. D. Arnott, "Somerleyton Hall."

Class IX. (Enlargements on Ilford paper).—Gold medal (with-held); silver to F. Whaley, for "The Choristers," a group of geese, with girl and windmill in background.

Class X. (Lantern Slides).—These were all judged on the screen; twenty-five sets of six each were shown. Silver medal to J. E. Austin; bronze to Edgar Lee.

Class XI. (Instantaneous, amateur).—A poor and small class. Silver medal to W. H. Kitchin, "Yachts;" bronze to R. S. Redfield, for "Making Friends," a study of child and calf.

Class XIII. (for Societies).—Prize album to Birmingham Photographic Society. A good frame was also sent by the Tunbridge Wells Society.

Class XIV. (Prints on Alpha Paper).—Silver medal to J. E. Austin; bronze to A. R. Dresser.

Class XV. (Interiors, professionals).—Silver medal to J. P. Gibson; bronze to Frith and Co.

Class XVI. (Champion Class).—Gold medal to W. W. Winter, of Derby, for "The Miss Beresfords." But as "My Mammy" and "Perplexed," by the same worker, were also shown, it must be conceded that Mr. Winter was very strongly represented. This strong class also included H. P. Robinson's new picture, "Gossip on the Beach," and the best work of Messrs. F. Whaley, Byrne and Co., R. H. Lord, G. Phoenix, Frith and Co., Redfield, J. E. Austin, and J. P. Gibson.

Every photographer in the midlands should visit Kidderminster before March 15th (when the exhibition closes), if it be only to make a careful study of the work in this class.

The prizes for members' work were carried off by Messrs. A. T. Bucknall, C. J. Carter, and A. Comber. The local work was not remarkable for either numbers or quality; but we believe the effect of this exhibition will be to act as a stimulus and an example, and that another year will see a marked change in these respects. The Worcestershire Camera Club are fortunate in having for a President Mr. M. Tomkinson, whose magnificent collection of Japanese objects has obtained European celebrity. The exhibition includes many clever photographs by Mr. Tomkinson, but they were not entered for any competition. The Secretary of the local society, Mr. William Ray, has also been indefatigable in his efforts to promote the success of the exhibition; while Messrs. Audrey and Grove have given valuable aid with the lantern. Altogether the Kidderminster Photographic Exhibition is a good one; it is well managed, and the pictures are admirably grouped and hung. It should do much good to the art locally, and we trust that it will secure a good attendance.

* * * *

HASTINGS AND ST. LEONARDS PHOTOGRAPHIC SOCIETY'S EXHIBITION.

(Communicated.)

THIS society, which represents a large section of the fair county of Sussex, although only twelve months old, has held its first public exhibition at the Memorial Hall, at Hastings.

The opening ceremony took place under most favourable auspices on Tuesday last week. The again and again Mayor of Hastings (Mr. W. Stubbs) presided, supported by Mr. Wilson Noble, M.P., who originated the society, and is its President. He was formally introduced by the Rev. A. B. Cotton, of the

Hanging Committee, and one of the moving spirits of the society.

Some pretty and well-deserved compliments passed, and the formal proceedings were brought to a close by the President presenting to the Mayor the two numbers already out of the work "Sun Artists," with a promise of the next coming number, as a souvenir of the occasion; and allusion was made to the striking coincidence that the artists so represented or selected were the three appointed judges of the exhibition, namely, Messrs. J. Gale, H. P. Robinson, and J. B. B. Wellington.

The society, probably having no doubt that they would be keenly competed for, was somewhat lavish in its offer of medals in this its first exhibition, particularly when it is borne in mind that the competition is confined to work of residents in the county of Sussex.

The judges gave their first award (the gold medal presented by the President for the best photograph in the exhibition) to No. 29, a charming little picture of San Giovanni and Paolo, Venice. On the award being made known, it turned out that this little gem was by Mr. Wilson Noble himself, who requested that this award might be reconsidered; the judges, under these circumstances, awarded it to the series by Mr. Brooker, the Hon. Secretary, Nos. 110 to 129, a very interesting set of photographs of local scenery and incidents.

The silver medal, for the best enlargement, went to No. 244, "Rough Day at Jersey," a fine sea piece, by Mr. A. R. Dresser. Bronze medals were awarded to Nos. 23 and 25, two interiors, by Mr. J. Smith; to No. 147, "A Summer's Day," by Mr. E. J. Bedford; and to No. 172, "On the Ribble," by Mr. R. H. Tiddeman.

The bronze medal in the scientific section went to No. 227, microscopic enlargements, by Messrs. J. W. Thomas and Co.

There was little or no competition in portraiture, so the silver medal in this class was withheld.

Throughout there is much promising work among the members, and they seem to have applied themselves diligently to illustrating their district locally. Situated as they are, with charming surroundings, in one of the fairest of the counties in the south of England, we shall look forward to work of increasing interest from the members of this enterprising society.

There is an added attractiveness to the exhibition in the display of photographs not in competition, notably by the three judges, who have sent fine specimens of their work.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to **The Editors, "Amateur Photographer,"** 1, Creed Lane, Ludgate Hill, London, E.C.

RULES.

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3526. **Posing, etc.**—I have to photograph a group of about thirty young persons. I purpose having for a background a hedge or a grass bank. Can any of your numerous readers oblige me with a few hints as regards posing, etc.?—**ARGENTI NITRAS.**

3527. **Micro-Photography.**—Will someone kindly tell me as a rough guide what would be a suitable exposure for powers 1 in., $\frac{1}{2}$ in., and $\frac{1}{4}$ in., and how to illuminate an ordinary microscopic lamp, and also how a blue-tinted chimney would affect the exposure?—**MICRO.**

3528. **Turkey**—I am going to Constantinople at Easter, via Vienna and Belgrade, ordinary train, not Orient express. Will there be any difficulty in getting a camera through the Turkish Custom House? Is photography permitted in Turkey?—**R. G. C.**

3529. **Reducer.**—Will someone kindly tell me the best and simplest reducer for silver prints, both before and after toning; is there a fixing solution that could be used directly after toning that would not destroy the colour of the print?—**G. B.**

3530. **Elkonogen and Hydroquinone.**—Can anyone recommend the formula of elkonogen and hydroquinone mixed, and give their experiences, as given in Fallowfield's "Remembrancer" for the quarter ending March? Also whether the formula of elkonogen and glycerine as a preservative will keep, and is a reliable developer as given in the same?—**G. B.**

3531. **Bromide Prints, Reducer for.**—Will someone kindly tell me the best and simplest reducer for bromide prints, and when it should be used? There is one mentioned in *Photographic Answers* for February. If someone could tell me from practical experience if it is reliable, would they kindly give me the formula? It must be entirely under control.—**G. B.**

3532. **Lantern-Slide Making.**—Will any reader give me the name of the best guide or book of instruction on lantern-slide making.—**E. N. P. (Malta).**

3533. **Over-Exposed Plate.**—Can any reader inform me the best thing to do with an over-exposed plate, when developed with the following solutions:—

	No. 1.	
Hydroquinone	...	80 grs.
Bromide of potassium	...	15 "
Sulphate of sodium	...	1 oz. avoird.
Water	...	10 ozs.

No. 2.

Soda hydrate	...	50 grs.
Water	...	10 ozs.

—**RAGA.**

3534. **Elkonogen Developer.**—Can any reader of the **AMATEUR PHOTOGRAPHER** tell me of a reliable elkonogen developer which will suit Eastman's celluloid films used in a detective camera?—**CLEEK.**

3535. **Films, Exposing.**—I would be glad to know the best manner of exposing films, say 10 by 8 ins., in an ordinary dark slide. The metal carriers and wood backs supplied by the Eastman Company for their paper negatives are not quite satisfactory in this case, and their roll-holder is unsuitable for exposing only a few films at one time.—**R. M.**

3536. **Madeira.**—Any information as to exposure, etc., will be esteemed. Can plates and chemicals be procured in Funchal?—**LANGSIDE.**

3537. **Isle of Wight.**—What places of interest are there in the Isle of Wight? I intend visiting there shortly, and should like to take my camera with me. Also name of a good and cheap hotel at Ryde or Ventnor?—**NERO.**

3538. **Additions to Lenses.**—Would Wm. London tell me an address to which I could write for one of the spectacle lenses which he mentions in his letter? Would he also inform me exactly what to ask for, and suggest how I could fix the said lens at the rear of a Steinheil's 11 in. applanatic doublet, so as to admit of the focus being varied?—**PHOTOPHONO.**

3539. **Precipitation of Bromide Paper Developer.**—Would anyone be kind enough to tell me the reason of the following? In Eastman's developer for bromide paper I find that in the two solutions the iron in one is thrown down, and restored to its original form of crystal, and that, too, after it has been fully dissolved. I have used citric instead of acetic acid in this solution. In the other (No. 2) the oxalate is also thrown down in same way, after being dissolved. Both have been dissolved in hot water, and left before a fire as well. I presume it is the cold of the dark-room. Can any of your chemist readers give me the reason? Would gladly send them the formula. After developing, and after they have been mixed, the iron only is always

deposited after a day or two. This doesn't matter, but before development it is a different matter.—COLONIST.

3540. **Hand-Camera.**—Which is the best hand-camera to buy, at about £7 or £8? I see Fallowfield's is well spoken of.—COLONIST.

3541. **Bromide Paper.**—Will some one tell me the best way of vignetting landscape prints on this paper, when printing by gaslight? What is the best form of frame and mount for four or five whole-plate prints in one frame?—A. L.

3542. **Purple-Blue Toning.**—How can I obtain a rich purple-blue tone on ordinary albumenised-sensitised paper?—F. L. A.

3543. **Lens for Hand-Camera.**—I am making a quarter-plate detective camera, carrying twelve plates in metal sheaths, and changed by lever and bag at top (something like the Diamond detective). Would some of your readers kindly put me right with regard to the proper kind of lens to get? It should be of fixed focus, and low in price. Would the lens of Lancaster's quarter-plate Instantograph be suitable? Any information will oblige.—ONE IN A FIX.

3544. **Plates.**—Can any brother photographer please tell where I can get Ilford plates in Antwerp and Brussels?—TRAVELLER.

3545. **Reducing.**—Would any brother amateur please give me a good formula for making oxone-bleach, for the purpose of reducing the density of negatives, and how to use the same?—IGNORAMUS.

3546. **Angle of Lens.**—Is it really a fact, as stated by E. J. Feilden in answer to 3403 (Lens), that "the larger the lens the greater the angle of view"? as it does not accord with my reading.—BARON.

3547. **International Camera.**—Can some one kindly inform me whether Lancaster's quarter-plate International camera and Rectigraph lens is one which is thoroughly reliable and a good worker for groups, views, and architecture?—POOR CHINESE.

3548. **Stereo Slides.**—Are the glass stereo slides on ordinary or specially prepared plates; where can they be got; and also where can I get the ground-glass to back them with?—STEREO.

3549. **Stereo Slide.**—Amongst the stereo slides sent in for competition there is one of a "Water Mill"; the slide is marked "Rosset Mill." Will the owner kindly let me have a good print (silver) of the same, as I would very much like to have one? I am willing to pay; he need not trouble to mount it.—S. STAMP, 25, Wellington Street, Stockton-on-Tees.

3550. **Definition Wanted.**—Will some kind reader give the meaning of the following, and how to prepare it:—"A solution of gelatine holding in suspension sulphate of barytes or finely powdered kaolin?" (Taken from page 616 of the "British Journal Photographic Almanac.")—PUZZLED.

3551. **Photo and Tricycle House.**—Will some one kindly inform me where I can get a moveable shed which would do as a developing room and tricycle house?—WANDERER.

3552. **Bromide Enlargements.**—Can any amateur inform me the best formula for enlargements with elikonogen, and is it better than iron developer? Can anybody who develops with hydroquinone tell me if it is better than pyro developer?—E. A. B.

3553. **Norfolk Broads.**—Would some reader kindly give me some information about a holiday trip on the Norfolk Broads, such as cost of hiring small yacht (to accommodate about three), etc.; also a list of books published about them? I have read Suffling's "Land of the Broads." Any information will oblige.—A CONSTANT READER.

3554. **Featherweight Slides.**—Will any reader who has tried the feather-weight slides kindly give experience for whole-plate, and where I could purchase same, and what price?—AMATEUR.

3555. **Opal Printing-Frame.**—How can I make a frame for printing opals?—H. M. S.

3556. **Lancaster's Combination Lens.**—Will some user of this lens kindly give his experience? Please state its principal faults. I have looked through back volumes, and have found several queries similar to above, but no replies.—H. M. S.

3557. **Fitting Lens with Rack and Pinion.**—I want to fit a whole-plate wide-angle lens with rack and pinion. Lens has Iris diaphragm. I am a bit of a mechanic, and want rough instructions for doing above.—H. M. S.

3558. **Stereoscopic Effect.**—Would superimposing one image produced by one lens of a stereo camera upon the image produced by the other give a stereoscopic effect? Has this been tried? I mean to have the two images taken on one plate at same exposure.—R. H. T.

QUERIES UNANSWERED.

Jan. 10th.—Nos. 3353, 3356, 3367.

Feb. 7th.—Nos. 3417, 3430, 3435.

14th.—Nos. 3437, 3441, 3452, 3454, 3457.

21st.—Nos. 3468, 3468, 3469, 3471, 3472, 3476, 3477, 3478, 3484, 3486, 3487, 3489, 3490, 3491, 3493, 3494, 3502.

28th.—Nos. 3505, 3508, 3514, 3517, 3518, 3521, 3524.

ANSWERS.

3328. **Developer for Foreign Travel.**—I would give washing soda and dry pyro the preference. See full details in "Scraps," Ilford issue, for February. I have abandoned hydroquinone for negatives entirely; many of my friends, after careful trials, have also. If "Vectis" sends me address, I will hand it to a prominent member of the Photographic Society of India, who is at present in Liverpool; he may be able to give you some hints for tour in East.—T. S. MAYNE (address with Editor).

3339. **Oiled Glass.**—The matter is one that the querist should experiment in for himself.—THE SMITH.

3347. **Cloud Negative.**—If the negative be worth the trouble, make a positive on glass, and from that make another negative on celluloid. You can then print from either side, and have no more trouble with oil or vaseline.—THE SMITH.

3348. **Leintype.**—I believe the process is protected by patent, and may not be used without license.—THE SMITH.

3357. **Exhibition Matters.**—All pictures at public exhibitions must be mounted; style of frame optional (except Oxford and ovals), usual style oak slip with small gilt fillet—not too much margin on cardboard mount. Have an afternoon at Crystal Palace Exhibition, opens on Tuesday, March 11th. Look out specially for the exhibit of Liverpool Amateur Society; you will find some handsome designs. For platintype I prefer the narrow black ribbed slip. 12 by 10: one in a frame sufficient. Whole-plate may be also singly, or four may go in one frame. Glass, of course, in all framed pictures, close to the mount and picture.—T. S. MAYNE.

3369. **Enlarging Camera.**—Messrs. Lancaster would no doubt be happy to give you the information.—THE SMITH.

3372. **Enlarging.**—Make a negative of your finished photograph, then enlarge. I have done several on Morgan and Kidd's opals. I find good results very simple. Develop with hydroquinone (Thomas' formula, half strength).—T. S. MAYNE.

3372. **Enlarging.**—The querist will find all he wants to know in the series of articles by Mr. Hepworth, and the competitive papers which have appeared in recent numbers. The subject could not well be epitomised in an "answer."—THE SMITH.

3376. **Magnifying Lantern Slides.**—The address of Mr. R. H. Bow, C.E. (inventor of the "Diaphoscope") is 7, South Gray Street, Edinburgh. I overlooked this query or would have answered sooner.—P. Q.

3386. **Flashing Light by Electricity.**—If "Electra" will send his address, I will send him some specimens of flash-light pictures done by pneumatic means. I have never tried the electric current, and can't see where any advantage could result.—T. S. MAYNE (address with Editor).

3392. **Lantern-slide Making.**—Simplest and most certain for an amateur. I give preference to Mawson and Swan's plates, using Thomas' hydroquinone developer, full strength. Great variety in tone can be obtained with the new Alpha plate, but use the Ilford formula for development. See also answer to 3504.—T. S. MAYNE.

3410. **Tripod.**—McKellen's own. A friend of mine has one half-plate size, which he got with a stereoscopic camera last week, which he does not require. Send me your address.—T. S. MAYNE (address with Editors).

3410. **Tripod.**—McKellen's tripod, which is made to fit his patent turntable, can be bought separately.—THE SMITH.

3414. **Lantern Screen.**—Washable lantern screens are not expensive; send for list A. E. Dyson, 46, Water Street, Huddersfield. The results, specially with limelight, far superior to the semi-transparent heating so often used.—T. S. MAYNE.

3414. **Lantern Screens.**—A process in which oxide of zinc is used is mentioned by Mr. Hepworth in the AMATEUR PHOTOGRAPHER, No. 274.—THE SMITH.

3422. **Lens for Detective Camera.**—The best lens is always the cheapest, and for the size you want you cannot do better than get a $\frac{1}{4}$ in. Ross R.S. or a $\frac{1}{4}$ in. Dallmeyer R.R.—THE SMITH.

3460. **Hand Camera.**—I should not recommend your correspondent to buy a Facile until he has seen Rouch's Eureka. It has several advantages over the Facile.—E. F. B.

3482. **Copying.**—Rack out your camera to twice the focus of the lens, and place the print the same distance in front. Focus carefully, use a small stop, avoid all false reflections from the glass surface. Use a slow isochromatic plate, and in a fairly lighted room and with stop $f/16$ give about four minutes. The method of printing will depend on the character of the resultant negative and individual taste.—THE SMITH.

3464. **Toning.**—Black tones can be obtained as follows:—Tone with

Chloride of gold...	...	1 gr.
Phosphate of soda...	...	20 grs.
Water...	...	8 ozs.

This bath does not keep. Tone deeply, fix, and wash moderately, then put prints into a weak solution of acetate of lead. A white precipitate will be produced. Pour the solution away, and pour some more of it on; let it remain about three or four minutes, and wash well in water. The acetate of lead decomposes

the hyposulphite of soda, and possibly forms some sulphide of silver. These prints are supposed to be as permanent as others. The best process is, however, Clark's new platinum process. Tone with:

Chloro-platinite of potassium...	4 grs.
Nitric acid...	3 drops.
Water...	8 ozs.

Or else use a solution of

Oxalate of potash...	42 grs.
Water...	1 oz.

Acidulate with a few drops of nitric acid, so as to turn blue litmus paper red, and add chloroplatinite of potassium in about the same proportion as above; fix and wash as usual. I find it best to print deeply.—J. G. P. VEREKER.

3465. **Stereography.**—A pair of stereo lenses may be fitted to almost any parallel bellows camera of half-plate or larger size, and a camera bellows maker would make a stereo division for a small sum.—THE SMITH.

3473. **Using Camera in Hand.**—I should say Mr. Winn had better focus a distant object, and make a mark on his camera, so as to be able to fix it at once at the focus for distant objects. All objects beyond a certain distance will then always be in focus. This point he can find by experiment. The following table, published some time ago, may be of use to him:—Fix the camera at the equivalent focus, then for a lens with a 9 in. focus the disc of confusion will be less than $\frac{1}{16}$ in. at the following distances in feet: $f/5$ at 137, $f/10$ at 68, $f/15$ at 45, $f/20$ at 34, $f/30$ at 23, $f/40$ at 18, $f/50$ at 14, $f/60$ at 12 ft. Every object with any stop will be absolutely in focus at 180 ft.; vide Gotz's or Suter's tables. He will want a finder, probably, but these can be cheaply got, or else he can use a concave lens attached to the camera. He would probably be able to buy one in Dresden.—J. G. P. VEREKER.

3479. **Hydroquinone for Lantern Plates.**—Thomas' formula with Thomas' plates gives good results.—E. F. B.

3492. **Test Papers.**—"G. B." will find all about the test papers usually used, in works on practical chemistry. They can be bought in books from photographic and, indeed, most chemists. The ones most used are red and blue litmus, turmeric, and Brazil wood papers. Red litmus turns blue in alkaline solutions, and turmeric paper turns from yellow to brown in the same solutions. Colonel Ross says turmeric paper also turns red in a solution of boracic acid, and orange in zirconium solutions. Blue litmus turns red in acid solutions. Brazil wood paper turns from red to yellow in hydrochloric acid. Starch paper is sometimes used. Iodine turns it blue, and acetate of lead paper turns black in the presence of sulphuretted hydrogen.—J. G. P. VEREKER.

3495. **Rapid Rectigraph.**—Rectigraph means straight-drawing, and rectilinear straight-lined. The two terms are synonymous.—J. G. P. VEREKER.

3499. **Hand Camera.**—I recommend Rouch's Eureka; but I have only inspected, not used, others.—E. F. B.

3503. **Toning.**—There is no such formula.—E. J. FIELDEN.

3504. **Alpha Lantern Plates.**—Black tones. Develop with Ilford formula as given in each packet. Fix and tone at one operation.

Water...	10 ozs.
Hypsulphite of soda...	2 1/2 "
Acetate of soda...	1/2 oz.
Sulphocyanide of ammonium...	1/4 "
Gold...	4 grs.

This may be used over and over again. When action becomes weaker, you may leave your slides in all night; no harm will result. Under-exposure and fixing in ordinary hypo gives a greenish picture.—T. S. MAYNE.

3507. **Dry Powder Developer.**—I have used this for months, and find it acts well for all pictures, instantaneous or not; also for bromide paper. It merely requires to be kept in a dry place. As one of the powders is not very soluble, I find it best to triturate it in a small mortar, and gradually dissolve it.—G. H.

3507. **Dry Powder Developer.**—I find the developer very good, and keeps well; have had some twelve months, using no other protection than cardboard box kept in a dry place. To keep ready for use, mix two packets of each in 3 ozs. water, which will develop eight quarter-plates by using a glass-stoppered bottle. Suits instantaneous pictures well. If querist writes me, I will give him further particulars and a sample packet, as I do not know if he refers to the Oldham dry-powder developer.—ALPERUM (address with Editors).

3507. **Dry Powder Developer.**—This is a very fair developer, especially for travelling. I have got some most successful results from using it. It will keep any length of time if kept well corked in the bottles it is sold in. Be careful to keep it in a dry place. As to your last question, certainly; why not?—W. A. J. CROKE.

3509. **Thomas's Plates.**—The best means is practice. It is impossible to give rules, as every exposure varies according to subject and light.—E. J. FIELDEN.

3510. **Stops.**—This cannot be answered without knowing the diameter of the stops. Ascertain this

and divide the focal length thereby, the result being the number of stop.—E. J. FEILDEN.

3510. **Stops.**—Simply divide the focal length by diameter of stop. If the stop is $\frac{3}{8}$ in. in diameter, it will work at $f/16$.—HOBBS.

3511. **Clearing Bath.**—Acetic acid, 1 drm. to 1 pint of water. I found the yellow to cease by diminishing the alkali used.—E. J. FEILDEN.

3512. **Clearing Bath.**—All bromide prints should be cleared both before and after fixing. The following is from "Fallowfield's Annual":—Acetic acid, 1 drm.; water, 32 ozs. Citric acid may be used instead of acetic, in which case use $\frac{1}{2}$ oz. to the pint of water.—W. A. J. CROKE.

3512. **Time Shutter.**—Newman's patent. I know of nothing better. Mine, a 10 by 8, answers well, and does not get out of order. To be had at Hinton's, Bedford Street.—T. S. MAYNE.

3512. **Time Shutter.**—I can recommend the Optimus shutter, but I should advise any exposure over $\frac{1}{2}$ sec. to be made by hand.—E. J. FEILDEN.

3513. **Hand-Camera.**—A camera to take pictures 5 by 4 is such an awkward size. Why not get Fallowfield's hand-camera 4 $\frac{1}{2}$ by 3 $\frac{1}{2}$, as this is the most useful size for lantern slides. For opinions of this camera see last week's answers.—W. A. J. CROKE.

3513. **Hand Camera.**—Call at 43, Charterhouse Square—the Photo Supply Association—and see Swinden and Earp's patent, the most portable and reliable I have ever used; no double backs, no tin sheaths for plates. Ten friends of mine have abandoned all theirs, and provided themselves with the above. I may mention in mine, a 5 by 4, I have a Taylor's detective lens, 6-inch focus. I was induced to decide on this after seeing the superior work done by Taylor's lens when assisting in judging hand-camera productions.—T. S. MAYNE.

3515. **Trafalgar Plates, etc.**—I have great pleasure in saying a word in praise of these plates, as I have been more successful with them than with any other make that I have used. They give good density, and yield vigorous negatives full of detail; and they allow of great latitude in exposure. The hydroquinone developer used in developing these plates I have found to be excellent.—W. J. E.

3515. **Trafalgar Plates, etc.**—Have used Wood's Trafalgar plates, also sensitised paper. The plates are as good as any on the market at the price. Have never used the acetate bath, but have got excellent results with borax. Cannot say anything about the developer.—T. PROBERT.

3515. **Trafalgar Plates, etc.**—These plates are very slow, and suit a beginner admirably. I find the borax bath gives the best tones to Wood's sensitised paper, which is likewise excellent. I have not had enough experience of the hydroquinone developer to give an opinion on it.—BORROWDALE YEWIS.

3516. **Lancaster's Instantograph.**—Lancaster's Instantograph is a very useful, handy little camera, well worth its price. The lens is a very good one for all round work, especially when taking instantaneous pictures. The camera is strong and well made. "Beginner" would no doubt find the Instantograph better suited to him than the International. There is very little to choose from between Underwood's and Lancaster's, but I prefer the latter.—F. L. A.

3516. **Lancaster's Instantograph.**—This is a most excellent camera for the money. The lens is very good, and the camera is extremely strong, well made, and portable. The shutter does not vibrate camera. On the whole the International is even better, being more expensive. They are both splendid cameras, as I know from experience. Underwood's cameras are not any better than Lancaster's.—R. F. JOHNSTON.

3516. **Lancaster's Instantograph.**—There is no better camera for the money. A fair lens for a beginner, but not quick enough for very fast work. No; both are good cameras. The latter has perhaps a greater reputation, but this is practically a matter of opinion.—J. EDWARD.

3519. **Toning Lantern Slides.**—See 3504, re Alpha plates. For the ordinary transparency plates, produce a weak, thin slide; after fixing and washing well, bleach the image with mercuric chloride; again wash well; tone with

Hot distilled water	...	...	8 ozs.
Sulphocyanide of ammonium	...	...	30 grs.
Carbonate of soda	...	...	3 "
Saturated solution of hypo	...	...	1 minin.

When tepid, add

Distilled water	...	...	2 ozs.
Gold	...	...	4 grs.

The above formula was given by Mr. G. F. Blackmore, in a paper read before West London Society, on March 8th, 1889.—T. S. MAYNE.

3520. **Lens for 5 by 4 Hand Camera.**—See 3513. Taylor detective lens. Send for catalogue with full description. No trouble with the 6 in., the largest made for this work having objects 15 ft. and further in focus.—T. S. MAYNE.

3520. **Lens for 5 by 4 Hand-Camera.**—You seem to want a lens, say, $\frac{1}{4}$ in. focus that will cover a 5 by 4 plate sharply, with a full aperture of $f/8$. Such a lens made of flint and crown would be impossible, but by the introduction of the new Jena glass it is *no fait accompli*. The only lens I know of that will do this is Voigtlander's wide-angle Baryscope,

price £3 19s., to be had at Marion's on approval if required.—HOBBS.

3520. **Lens for 5 by 4 Hand-Camera.**—The rapid lens supplied by the Blackfriars Photographic and Sensitising Company, Surrey Row, Blackfriars, will suit your purpose. The focus is $\frac{1}{4}$ ins., and it will work at a fixed focus of 12 ft. This is one of the most rapid lenses made.—MACGREGOR.

3522. **Copying.**—Your question is not sufficiently explicit; the length of exposure will depend on the rapidity of your lens, and on the brand of plates; if you let me know these particulars, then I can give you some idea of length of exposure necessary.—W. J. E.

3522. **Copying.**—It depends on your lens, the photograph, and the light. For a photograph with strong contrasts in bright daylight from $\frac{1}{2}$ to 2 secs., by gaslight the exposure varies from $\frac{1}{4}$ to 5 minutes, according to illuminating power. Will give you any information through the post if you write, enclosing postage.—J. EDWARD (Editors have address).

3522. **Copying.**—This will all come by experience. It is impossible to give the exact exposure. Try a small stop, and five minutes' exposure to start with.—W. A. J. CROKE.

3522. **Copying.**—Place in good diffused light, see that there are no reflections from the surface of the object, stop down, and give full exposure, governed by the light and colour of the object.—E. J. FEILDEN.

3523. **Action of Fire Light.**—Certainly.—E. J. FEILDEN.

3523. **Action of Fire Light.**—Most certainly. You will get your plates very much fogged, especially if they are quick plates.—W. A. J. CROKE.

3525. **Elimination of Hypo.**—All these so-called hypo eliminators are useless. If you want to eliminate hypo, buy one of Wood's circular print and plate washers, which does its work in a most satisfactory manner, as I can vouch for by experience.—J. EDWARD.

3525. **Elimination of Hypo.**—The only satisfactory means is water.—E. J. FEILDEN.

3525. **Elimination of Hypo.**—Not altogether satisfactory.—R. F. JOHNSTON.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.—EDS. AM: PHOT.

LESLIE BAKER.—Your answer to query 2461 should appear in our "Sale and Exchange" column (three words a penny).

CAMERA.—We are afraid there is but little chance of your having the loan of "Monthly Competition" prints, they are booked for months. It was quite impossible to reproduce all the photographs in "Home Portraiture," those most suitable were selected.

S. WOOLLEY.—We should advise you to buy No. 4. This lens is fitted with Iris diaphragm, and is a most perfect instrument.

C. H. CHASE.—(1) At the price certainly, and thoroughly reliable. (2) We should advise the a shutter.

BERTRAM THOS. ORD.—You will have difficulty in securing a copy, and had better advertise for a copy in our "Sale and Exchange" columns.

CONDENSER.—We do not think it at all probable that your idea, so far as we can understand it, and your sketch, will answer. A very good article upon the subject is published in the AMATEUR PHOTOGRAPHER of February 14. You will be quite safe if you follow the instructions given there. In the PHOTOGRAPHIC SOCIETIES' REPORTER several papers have been published describing different forms of enlarging apparatus.

CHAS. WARREN.—We cannot undertake to sell your lantern, but you can send it up to us, and insert an advertisement in "Sale and Exchange" column.

G. B.—We have sent you the address of the competitor whose print contributed to the "Inland Scenery" Competition you admire, and feel sure he will give you every information. The advertisement pages are all numbered with Roman numerals, and do not, therefore, run consecutively with the letterpress. It is, of course, for you to decide whether you bind them in. We may add that it is not general to bind up the advertisement pages of a weekly publication. Certainly the special numbers, if you have them, should be included.

ZEPHYR.—Enlargements are not eligible for entry in the AMATEUR PHOTOGRAPHER Monthly Competitions, unless advertised. All prints must be from the original negative.

H. F. FOY.—(A) We should say beats of one second would be sufficiently quick; you must take care in your machine to have no jar at the end of the beat. You will find the following useful as text books: "Photography for All" (Harrison), "Modern Dry Plate Photography" (Burton), "Science of Photography" (Chapman Jones), "Instructions in Photography" (Abney), "Photographic Chemistry" (Medala), "Experimental Photography" (Leaper).

J. B. H.—As you wish to combine a time and instantaneous shutter, we would advise 1, 3, or 4,

and think you will find 3 answer your purpose best. We have been much pleased with it. 1 is an expensive shutter, but being made entirely of metal there is, when used for marine work, the risk of oxidation, or else it is without doubt a very excellent shutter.

AMATEUR.—If you want to exchange photographs, you must advertise; the Queries and Answers columns are not for that purpose.

E. N. PRICE (Malta).—We should advise you to obtain a copy of "The Book of the Lantern," sold by our publishers.

J. C. DAWSON.—Yes, we are now aware of the meaning of the "notice;" such catches are likely to prove very disappointing to both receiver and sender.

JOHN J. VINCENT.—We are afraid that we cannot give a "Beginners' Column," but our Query column is open for the very simplest question, or we will be pleased to answer questions in this column. You had better buy either one of the first two, or else the last one recommend to "H. F. Foy" in this column.

W. B. PEARCE.—Many thanks; we shall send a "Special Commissioner" to see the apparatus.

C. W.—We should advise the "second plan," and the use for your purpose of an R. R. lens, but you will, of course, have some difficulty in focussing. (C) A Magazine camera would, perhaps, be preferable. We should advise R or G. Cannot well describe the "Euryscope" in this column. The camera I is, we understand, a very fair instrument, but we have no knowledge of the lens. Write us again if these replies are not sufficiently full. With a hand camera it is impossible to do as many varieties of work as with camera on tripod.

W. J. RIDD.—We can recommend both A and B lenses, and also A and B cameras; you had better decide to have lens and camera, in this case, from the same firm. The enlarging camera you mention is well worth the money.

D. E. GODDARD.—Please let us know what information you require, as you will note that there is no longer an associate editor.

REUBEN COCHRANE.—Pleased to hear that you have been a subscriber so long; kindly hand the copy sent you to some friend. We shall be pleased to see your work, and if you are persevering and painstaking you may succeed in securing an AMATEUR PHOTOGRAPHER medal.

HAMISH.—Before experimenting with various printing processes, it would be well for you to set yourself to make a perfect negative. If you follow carefully the instructions given by Mr. Wall in the "Dictionary of Photography," you will be able to secure the colours named by him. The prints you send us are very unsatisfactory. We should say your negatives are very thin, particularly the portrait in that print; the face is good, but the dress has no detail whatever. The children's feet and legs are out of focus. You are working with a good lens, but must be more careful in focussing. Send us silver prints, or better still the negatives, and we may be able to further help you. The book "Platinum Toning," by Lyonel Clark, can be had of our publishers, price 1s., or 1s. 3d. in cloth.

CYRIL R. LUNN.—The photograph hardly bears out the title; we have sent your letter on to the artist (?). Adverse criticism is good for every one; it is possible he may write you.

W. T. BROWNE.—Secretary's address, Mr. S. W. Gardner, 7, Barry Road, East Dulwich, S.E.; this you could have found in the PHOTOGRAPHIC SOCIETIES' REPORTER. With the camera you name you could certainly obtain negatives that would make good lantern slides. Very glad to hear that you intend "going in" for lantern-slide making. We cannot do as you wish, except the slides are to be used for exhibition purposes. Send us some of your own slides, and we will give an opinion upon them with pleasure. We shall see you, perhaps, at the Crystal Palace. Our shows are on the afternoon of the 14th and evening of the 15th. We do not advise the camera named in your P.S. for taking negatives for lantern slides.

CONSTANT READER.—You will be quite safe in buying either No. 2, 4, or 5. No. 2 is the cheapest, and with an R. R. lens does almost any work you please. No. 5 is very handy, and although we have not had an opportunity of using it, know that work of a first-class character can be turned out. It is a very handy and convenient instrument.

ANDREW PRINGLE.—No more than you deserved. W. K. BURTON.—Your article is amusing and instructive; the photographs shall be reproduced.

NEBO.—The Isle of Wight is full of interesting work for the amateur photographer, especially from Shanklin to Blackgang; afraid we cannot advise as to cheap hotels, but insert your letter in our Query columns. We are advising you by post as to "Dark-Rooms."

JOHN H. HODGES.—Will take care to keep your name before us.

CYRIL R. LUNN.—Mr. Austin says, in reply to your letter, which we sent to him, "The Professor is quite right." There does not seem any necessity to publish your letter.

JOHN E. AUSTIN.—With reference to "Prize Tour Competition," you will have heard from us. You did not comply with the conditions, so we were reluctantly compelled to return the photographs entered by you.

H. P. ROBINSON.—MS. to hand, also print, "He never Told his Love," for QUARTERLY. We should like to reproduce the group very much.

B.—We can recommend "Photo-Micrography," by A. Cowly Malley (Lewis).

LOLA.—The second you name we can thoroughly recommend. It will answer all your requirements.

H. B. MORRIS.—We cannot advise you, as we have never used the lens, and without seeing it should be unable to put a value upon it.

WEST INDIA.—You will find No. 1 camera a reliable apparatus, and we should advise No. 1 lens. We are much pleased with No. 2 shutter, and think you can safely purchase. As you are proceeding to Jamaica, we should advise you not to risk purchasing the AMATEUR PHOTOGRAPHER out there, but let our publishers send it to you direct.

J. R. M.—1. We only know that the maker states it as a fact; the lens we have no experience of. 2. We consider this hand camera the cheapest in the market. The shutter is very simple, and can be worked with or without a spring. There may be better cameras exhibited at the Crystal Palace; perhaps you had better wait and see.

ZINKENITE.—The few cameras we have seen made by the firm have been well made, and the price named by you is certainly reasonable.

TYRO.—We should advise the use of No. 2 plate. The γ lens is certainly superior, and is worth the difference in price.

EDWIN SMITH.—Many thanks for your letter and good wishes, so admirably expressed.

WM. FREV.—We are now arranging to have reprints of any papers read before societies, which appear in the PHOTOGRAPHIC SOCIETIES' REPORTER, and shall be pleased to hear from you.

H. E. PERKINS.—You will be quite safe in buying No. 2 lens; it will do all that you are likely to require, and is a very beautiful and correct instrument. Afraid we hardly merit all the good things you say of us.

W. B. PEARCE.—Very silly of us. Thank you.

THOS. MAYNE.—Stereo slides. No doubt it can be arranged; will write you. Good of you to send us such a batch of answers. Glad to find that you think the "Half-crown Prize Pictures splendid!" Your suggestion is a good one, but oh! the cost. Still, we may do it. Will write soon upon general matters.

W. L. GROVES.—Your strictures upon the Index are, we fear, too well deserved, and the suggestions for improvement shall have our best attention. We hope we shall reap the reward that, as you say, "always attends courteousness, energy, and enlightenment."

FREDERIC L. WORSLEY.—The dates advertised are the last dates upon which prints can be received in each "Monthly Competition"; for instance, "Landscape with Figure," last date, March 14th.

ERNEST WINN.—We cannot advise A. B is a most ingenious apparatus, and has many advantages, but whether in practice it is reliable we are not in a position to say. C is a thoroughly reliable, well-tried, and useful hand-camera; we do not think you could do better. We should advise lens A. One of our staff is writing you by next mail.

EDGAR B. HOWARD.—A very ingenious shutter, but there is certainly a jar; it would be well to let the drop fall upon a rubber buffer or small spring, care being taken that it is not strong enough to rebound. We should think it possible that some firm of photographic dealers might be willing to take it up. Send us some specimens, we are rather sceptical about the aperture. Will you call?

WILLIAM BARRETT.—Very busy with Crystal Palace Exhibition, but shall hope to be free after next week; will write you.

JAMES A. JACOB.—Will give you a line next week.

W. L. H.—Certainly it is permanent; see Wall's "Dictionary of Photography."

FRANK APPLEBY.—We usually engrave our medals, and it would be impossible to send them in time.

J. A. HAMILTON.—The AMATEUR PHOTOGRAPHER silver and bronze medals shall be struck in order that you can, as you suggest, exhibit them in Belfast.

TOM HADLEY.—We should advise B camera. EDWIN JURY.—There is a very excellent photograph club in your district, the Brixton and Clapham Camera Club; President, Mr. A. R. Dresser. Particulars of address, etc., will be found in the PHOTOGRAPHIC SOCIETIES' REPORTER, which is published at 1, Creed Lane, E.C.

EARNEST.—Quite impossible to help you without seeing the lenses.

A. A. LLOYD.—"Platinum Toning," by Mr. Lionel Clark, can now be had of the publishers, 1, Creed Lane, Ludgate Hill; other books of the AMATEUR PHOTOGRAPHER'S Library will be ready very shortly.

LUDER.—We should advise Z, it is well made, and will meet all your requirements.

R. E.—A very capital subject and print; your shadows are rather deep, but you have made a charming picture. Should suppose you could get a view with both sides of the picture brilliantly lighted? May we retain the print?

JONATHAN FALLOWFIELD.—We will get you those prints if we can. All right, will send the camera

over. Glad to hear that "In a week or ten days you hope to make a specially interesting announcement." Everyone is asking if you will have anything new "on show" at the Crystal Palace Photographic Exhibition.

JOHN WALKER.—We must write you; should advise your "keeping dark;" quite think there's something in your proposed apparatus.

C. EMANUEL.—Received; will answer next week.

W. B. M.—ERNEST H. CARTWRIGHT.—Will publish your letters next week.

Prize Tour Competition.

In the above competition we have received the following entries:—

W. McLean Forbes	...	New South Wales
Miss Griffith	...	Littlethorpe
W. W. Whittard	...	Cheltenham
R. J. Shields	...	Mexboro
W. L. Howe	...	Beeles
W. B. Windeles	...	Long Ditton
Mrs. Cole	...	Lewes
J. T. Black	...	Corstorphine
F. Anyon	...	Liverpool
A. G. E. Newland	...	Upper Burmah
W. L. Tindal	...	Newton Abbott
Lumley Cator	...	London
Capt. Brotherton	...	Cullercoats
R. Tindal	...	Leighton Buzzard
G. E. Galbraith	...	Stirling
F. G. Smart, M.A.	...	Tunbridge Wells.
W. H. Scott	...	Bradford.
H. Day	...	Tonbridge.
H. Holt	...	Southport.
H. E. Allen	...	Nottingham.
E. T. Zimmer	...	Anerley, S.E.
C. J. Jackson	...	St. Andrews, N.B.
M. C. Livingstone	...	Edinburgh.
J. O. Forster	...	Clapham, S.W.
Paul Lange	...	Liverpool.
S. H. Barton	...	London, W.
Charles Emmanuel, B.A.	...	London, W.
R. Leventhorpe	...	Camera Club
R. H. Blankley	...	Manchester
James Shaw	...	Glasgow
D. R. Clark, M.A.	...	Glasgow
James Young, jun.	...	Bristol
Rev. Wm. Mann, M.A., S.C.L.	...	London, W.
Capt. O. J. Fielden	...	Hughenden
C. S. Cobb, M.A.	...	Liverpool
W. P. Christian	...	Maidstone
*J. C. Austin	...	Doncaster
G. B. Bisat	...	Portsmouth
Surg. D. Wardrop, A.N.S.	...	Portsmouth
T. W. Pilkington	...	Blackburn
R. J. Orrell	...	Budapest, Hungary
Maurice De Dèchy	...	Hackney, E.
John Dace	...	Hampstead, N.W.
A. E. F. Evershed, L.R.C.P.	...	Shrewsbury
Martin J. Harding	...	Malmesbury
Miss C. Miles	...	

* Disqualified; conditions not complied with.

Sale and Exchange.

RULES.—Pence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two counts as one word; compound words count as two words.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge 1s. is made of whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second "	Silver Medal.
Third "	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Seascape—Landscape with Figure—Genre or Figure Study.

CONDITIONS.

1. Not less than six or more than twelve prints are to be entered for competition.
2. All prints must be mounted, and the title (only) must be legibly written on the front of the mount.
3. The work must be entirely the work of a lady, who must be a bona fide amateur photographer, and must have done all the work, except mounting, herself.
4. The negative of the prize photographs must be at the service of the proprietors of the *AMATEUR PHOTOGRAPHER*.
5. Photographs can be printed by any process, but must not be printed on opal, or mounted in optical contact on glass.
6. All photographs must be sent in on or before the 31st of May.
7. No prints will be eligible that have been entered for any previous competition.
8. Entry forms will be forwarded on receipt of stamped addressed envelope.

NOTE.—The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photographs at a Conversazione to be held in the offices, 1, Creed Lane, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

THE FORTH BRIDGE.

In view of the interest taken by all engineers, students, and others in the Forth Bridge as a triumph of engineering skill, the Proprietors of the *AMATEUR PHOTOGRAPHER* have pleasure in offering the following Prizes for the Best and Second Best Set of Four Photographs:—

First Prize	Silver Medal and £1 1s. 0d.
Second Prize	Bronze Medal and 10s. 6d.

Photographs must be sent in on or before Monday, the 10th of March, this date permitting of photographs of the Opening Ceremony, which was performed by H. R. H. the Prince of Wales on the 4th of March.

The Proprietors will require the use of the negatives of the prize photographs. If any competitors are willing to leave their prints in the hands of the Editor of the *AMATEUR PHOTOGRAPHER*, they will have pleasure in circulating them amongst the photographic societies.

All Competitions to be addressed:—'Forth Bridge Competition.' The Editor, *Amateur Photographer*, 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE Proprietors of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows:—

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	Mar. 14 ... July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, ANIMALS, ETC.	May 14 ... Sept. 14.

All photographs for any of the above competitions must be received by the FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Entry forms on receipt of stamped addressed envelope.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL,"

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his personal experiences. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

FRIDAY, MARCH 14, 1890.

[PRICE TWOPENCE.]

✻ OUR VIEWS. ✻

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

TO-DAY (Friday), at three o'clock, a selection of slides from those sent in to the AMATEUR PHOTOGRAPHER Lantern Slide Competition will be shown in the Opera Theatre, at the Crystal Palace. All competitors in that competition, and also in the "Prize Tour Competition," will receive special invitations, and we trust they will attend. "Afternoon tea" will be served at *five o'clock*; particulars as to position of room, etc., may be obtained on application to the attendants at the AMATEUR PHOTOGRAPHER stall. Through the courtesy of the Managers, the show will be repeated at seven o'clock on Saturday evening.

A very large number of photographs are exhibited at the Exhibition, and those contributed to the AMATEUR PHOTOGRAPHER "Prize Tour Competition" make a brave show, occupying no less than *nine* large screens in the north nave. In the alcoves some very excellent work is shown, but we must reserve any critical comments upon it until our next issue.

We understand from Mr. W. Brooks, who has the sole management of the Lantern Exhibition, that the lenses that were made for him to his order by Messrs. Taylor, Taylor, and Hobson, of Leicester, work splendidly, and are the finest lenses he has ever worked with. They are symmetrical in form, and therefore all the marginal lines are perfectly straight, *i.e.*, providing they are so in the slide. Mr. Brooks himself also informs us that he has made a great improvement in the light by a certain addition to the mixed jet, and is confident that he will be able to do full justice to the AMATEUR PHOTOGRAPHER Competition slides to be exhibited to-day and to-morrow.

* * * *

WE are very pleased to notice that the Lantern Society is in a fair way of being started, and an adjourned meeting will be held on the 19th inst., in the Regent Street Saloon of the St. James's Hall, to consider rules, etc.

* * * *

WE have received the full programme of the fourth annual Camera Club Conference, which will open under the presidency of Capt. W. de W. Abney, C.B., R.E.,

D.C.L., F.R.S., etc., on the evening of Wednesday next March 19th, with a smoking concert in the Club rooms.

On Thursday, papers will be read in the theatre of the Society of Arts, as follows:—

1. Presidential Address (Capt. W. de W. Abney, C.B., D.C.L., R.E., F.R.S.).
2. "The Art of Drawing and Photography" (Mr. A. M. Rossi).
3. "Limitations in the Treatment of Subjects by Focus" (Mr. T. R. Dallmeyer).
4. "The Influence of Stops on Exposure" (Mr. Lyonel Clark).
5. "Eclipse Photography" (Mr. A. A. Common, F.R.S.).
6. "Collotype Practically Illustrated" (Mr. W. T. Wilkinson).

There will be an exhibition of lantern slides in the theatre at 8 p.m. The exhibition will include the prize slides of the recent AMATEUR PHOTOGRAPHER competition.

On Friday the reading of papers will be continued in the following order:—

1. Official Communication upon the Subject of Regulations for Photographic Exhibitions.
2. "Photography by the Light of the Electric Spark" (Lord Rayleigh).
3. "A Photographic Untruth" (Captain Abney).
4. "The Latent Image" (Mr. C. H. Bothamley).
5. "Photogravure Practically Illustrated" (Mr. W. T. Wilkinson).

In the evening the members and friends will dine together at the Frascati Restaurant, in Oxford Street.

During the Conference there will be an exhibition of apparatus at the Society of Arts, and of members' work in the rooms of the Club.

The discussion upon "Regulations for Photographic Exhibitions" is likely, we hope, to be fruitful in bringing about reforms which are certainly needed. It will be remembered that the subject received a considerable amount of attention in the spring of 1888, and we would recommend those intending to enter upon the discussion to study the report of the meeting held on the 19th of April, which is given in the AMATEUR PHOTOGRAPHER, No. 187, May 4th, 1888, and also our editorial comments upon the same. The following are the items set out for discussion on this day week:—

- (1) That exhibition authorities and societies should decline

For Contents, Prize Competitions, Notices, etc., see page 187.

prizes placed at their disposal for the purposes of advertising.

- (2) That some restriction as to number of awards is required. Suggest a basis for a limitation.
- (3) That awards should be all of equal value.
- (4) That if any further division than art and science sections be required, the classification be of the simplest—say, in the art sections: (a) Landscape and landscape with figure, (b) Figure subjects, (c) Portraiture, (d) Architectural.

Other points upon which agreement is desirable are as follows:—

- (1) Selection and constitution of board of judges for art and scientific sections.
- (2) Announcement of judges' names as early as possible, and before entries are due.
- (3) The working the system of champion classes.
- (4) Exhibition in competition of work by a firm in which work several hands have had a share.
- (5) An intimation in regulations that the judges are requested to withhold awards in cases of insufficient merit in a class or classes.

Other points:—

Retouching? One picture, one frame? Diplomas or medals? Separate amateur and professional classes? Hanging Committee?

It is not our intention to give any opinion upon the points proposed to be dealt with, but we feel sure that good must result. The value of awards made at exhibitions must decrease so long as they are so numerous. It is not often that we are in accord with expressions of opinions which are published in our contemporary, *Photography*, but we heartily endorse the opinion expressed by their editorial contributor, "G. D.," who last week denounced the inviting of editors of photographic journals to act as judges at exhibitions. We are at one with him there, pointed though his remarks may be, and from the following quotation it will be seen that we had forestalled him in the editorial notes of the PHOTOGRAPHIC SOCIETIES' REPORTER for February 28th, in which we say—

"We are pleased to notice that the Committee will bring forward, in as complete a manner as possible, the subject of photographic exhibitions and their regulations. The discussion of this subject at the Conference was suggested in the editorial columns of the AMATEUR PHOTOGRAPHER. We hope one result of the discussion will be to relieve editors of photographic publications of the unthankful office of acting as judges at photographic exhibitions; and we are glad to find that at the Crystal Palace no one directly or indirectly connected with any photographic journal will be asked to serve on the bench of judges. In the past it has been almost compulsory, because the promoters of exhibitions were new to the work; but the calls upon the time of certain gentlemen, as well as editors, has become a serious tax—but, outside of that, editors of papers are best left free; they will all, we are sure, gladly advise; but, speaking for ourselves, we think the decision arrived at by the Managers of the Crystal Palace Photographic Exhibition is a very just one."

It is well known that with us the judging has been a labour of love entailing the loss of much time, and attended with very great inconvenience, but we have done it in the hope of helping others. We have had the honour of assisting in the adjudication of photographs contributed to exhibitions by every known worker in photography, professional and amateur, and have never had our judgment questioned except by the editing staff of a journal who do not recognise the difference between a colotype and a Woodbury print. In our own competitions we have invariably had the assistance of artists, and in all cases where possible we have advised their being included on the bench of judges. As far back as November 21st, 1884, we find an artist, Mr. T. Crane, acted for us as judge, in conjunction with

Mr. Walter Besant, and in November, 1885, we were honoured with the valuable services of Sir James D. Linton, and so we could, time after time, refer to the artists who have assisted us in judging photographs contributed to our competitions. There is no amateur photographer of note who has not been awarded the AMATEUR PHOTOGRAPHER medal, and we never remember to have received a protest except once upon a technical reading of our conditions with regard to one of the Prize Tour Competitions. It may be interesting at the present time to draw attention to an article from the pen of Dr. Emerson, which appeared in the AMATEUR PHOTOGRAPHER for October 23rd, 1885, entitled, "An Ideal Photographic Exhibition." We shall wait with much interest to hear what will be said upon the great question, and we shall hope to be allowed the privilege of "making a few remarks." But we do hope and trust the discussion will not drift into a tirade of abuse, either for or against different schools of art and thought.

* * * *

THE Forth Bridge Competition, owing principally to the very unfavourable weather, was not largely contributed to. We have, however, much pleasure in awarding the first prize, silver medal and one guinea, to Mr. Alex. Pitkethly, Leith, for four very good views. His pictures were accompanied by several detective shots, which clearly show that there was "a bit shower" on at the time, and that it was "verra soft."

* * * *

WE do not particularly concern ourselves about the finances of photographers, makers of photographic apparatus, dealers or others, but we understand that the London Stereoscopic Company are arranging for a very large extension to their already extensive premises in Regent Street. For some reason the shares in their Company are in the market and can be bought to pay 10 per cent. We can but think that they are worth the market price, especially as Messrs. Nottage and Kennard retain their holding in the concern, some £30,000. There is every reason to believe that with the opening of the new premises, a very large increase in business will result, and at present prices we certainly think shares are worth buying.

* * * *

A CORRESPONDENT is very anxious to know in which part of England the best photographic printing can be done. We have advised him the north side of London, but he is anxious to know whether any counties are better adapted climatically for printing than others. We shall be interested to have replies.

* * * *

SUN AND COMPANY, one of the best clubs for the circulation and criticism of photographs, has determined to increase its numbers from thirty to forty members. Mr. Martin J. Harding, College Hill, Shrewsbury, would be pleased to hear from ladies or gentlemen who may wish to join. All applicants must be amateur photographers, and must forward specimen of work, accompanied by stamped envelope for reply. We understand that more than 1,000 photographs, all members' work, have been contributed to the portfolio. The club is well worthy of support.

THE photographs sent in to our last monthly competition "Landscape or Seascape," cannot be said to be up to the same standard of excellence as several of the other—attributable, no doubt, in some degree, to the weather which prevailed last month. The prizes have been awarded as follows :—

First Prize (Silver Medal).

C. COURT COLE Oxford.

The title of the picture, "Is Father Coming?" is well carried out, the mother and children standing at the gate anxiously on the look-out. The storm gathering is well depicted, and the picture as a whole is a very vigorous one. The other prize, a Bronze Medal, is awarded for "Farndon on the Dee," by Mr. J. K. Taylor (Marple). Of other photographs contributed, we select the following as being worthy of special commendation :—

"Glengariff, Co. Kerry," Edward J. Jackson, St. Andrew's, N.B.
 "Eynsford, Kent," A. R. Dresser, Bexley, Kent.
 "Roxley Bridge," Chessington, Surrey. John Tims, Wimbledon.
 "The Gairn Ferry," D. Wardrop, Portsmouth.
 "The River Wye," E. P. Vulliamy, Glasbury.
 "St. Ives Harbour," Cornwall, F. G. Smart, Tunbridge Wells.
 "On the River Tavy," W. H. Scott, Bradford.

* * * *

THE entry forms, etc., for "Travelling Studentships," will, we hope, be ready next week, and the entry forms for "Ladies' Competition," will also be ready in a few days.

* * * *

It will be noticed on reference to the head of the Sale and Exchange column, that we have added another department, *i.e.*, the reporting upon goods offered for sale if sent to us for inspection; latterly several very heavy purchases have been made through our report. For this work we are, of course, compelled to make some charge, but we feel sure, to those living on the Continent, abroad, or in remote districts of the United Kingdom, this addition will be of great service.

* * * *

WE make an appeal this week for our subscribers requiring advice as to purchase of apparatus, criticism on photographs, etc., to write us *before* Tuesday whenever possible. The work under the heading "Editorial" increases enormously, and we are delighted to find our advice so sought after, but unless letters are received earlier it will be impossible to give all matters attention in the current issue.

* * * *

THE Hon. G. N. Curzon, M.P., who has just returned from his tour in Persia, concerning which he has written many interesting letters to the *Times*, told an interviewer that "nobody should travel nowadays without a Kodak." The youthful Member for Southport has taken scores of instantaneous photographs, which he intends using in his forthcoming book on Persia.

* * * *

WE are determined to push stereoscopic photography. A contributor to our late competition writes: "I believe stereoscopic work will come to the front again, mainly through the efforts of the AMATEUR PHOTOGRAPHER. I have introduced *four* tip-top workers to start it in the last month." We shall be glad to hear from any of our readers who have the ability and inclination to contribute a series of articles upon "Stereoscopic Photography."

WITH reference to a recent "money prize" gained by a competitor, he writes, "Thank you very much, and I feel *very proud* that I was able to secure first prize, as I consider it a great honour. I shall buy a gold charm for my watch chain, and have it engraved."

* * * *

A LESSON IN ART.

THERE is now being exhibited at the Fine Art Society's Gallery a series of pictures which it would be well worth while for every intelligent photographer to spend a couple of hours in studying.

Amidst the senseless strife which has been now raging and now smouldering, between those who style themselves "naturalists" and those who, with contending arguments, traverse their every statement, it is somewhat difficult to discover what should be the aim of the photographer who wishes his results to be something more than mere topographical representations.

Inasmuch then, as an ounce of practical observation is worth a ton of theoretical argument, it may well be advantageous for the would-be artistic photographer to inspect the charming pictures of Japanese life and scenery with which Mr. East has adorned the walls of No. 148, Bond Street. And if, after duly studying them, he asks himself what it is that gives these sketches their special charm, he will be bound to acknowledge, whether he be a "naturalist" or not, that it is their entire truthfulness to nature.

The majority of Mr. East's pictures are street or roadside scenes, tea-houses, temples, shrines, and cottages, with overhanging trees laden with plum or cherry blossom, the soft tints of which the artist most faithfully renders. Take No. 11, for instance, and note the painting of the different varieties of plum-blossom, and the beautiful blending of the colours of the house-roof with the dress of the figure and the flower-laden bough.

The artist's figures in the street scenes are often so placed and posed as to remind one of a well-conceived photograph; they frequently carry the air about them of being just about to step out from their doorways, or of walking along the street, so naturally are they rendered. No. 19 is a particularly attractive little bit representing a street scene on a rainy day, with the purple thatch giving the idea of being thoroughly soaked with rain, while along the street running with water, the picturesque figures, with their quaint umbrellas and high wooden shoes, gingerly pick their way past the white post that marks the police station. Mr. East, too, has a wonderful knack of grouping his subordinate figures, especially in the background, as in No. 39. No. 40 is a characteristic interior of a tea-house, with a group of girls squatting in the shade of a vine-covered verandah, while the still darker shadows of the interior of the building are yet seen to be peopled with figures. Nos. 41, 44, and 43 are all most interesting, and illustrate the artist's wonderful faculty for happy selection of subjects. The "Great Temple at Nikko" (No. 41) is, perhaps, one of the most finished of Mr. East's conceptions.

Then there is the earnest care manifested in rendering the varieties of atmospheric effect, the afternoon glow upon the pond of lotus flowers (No. 42), the truthful rendering of the snow scene (No. 51), without the least tendency to exaggerate or idealise, the moonlit lake in the beautiful landscape (No. 16), and the idea of dampness implied by every touch of No. 87—all testify to the artist's

power of conveying, in what he paints, that which cannot be painted.

It is noticeable that, amongst the various landscapes exhibited, there are not half-a-dozen in which some moving thing—even if it only be a boat or a wild duck—is not introduced. The distances of many of Mr. East's landscapes have as a background the well-known form of the great Japanese mountain Fuji-Sau, and it would be a good lesson for the *blurring* school of artist-photographers to study these distances, and mark well that the artist does not obtain the idea of intervening space and atmosphere by throwing the background out of focus, but paints the sharp outline of his snow-capped mountain clear and clean against the sky, —and yet the idea of great distance is truthfully preserved.

Many a lesson, indeed, can be learned from this series of delightful pictures, but we photographers, with the means we have at our disposal, cannot dare to emulate the artist in water colour or in oils; and this is more especially true of pure landscape. And it is from Mr. East's street scenes and roadside glimpses that we can gain most help for our work with the camera; we learn here exactly how and where our figures should be placed in connection with these surroundings, so as to obtain a perfect harmony of composition; for instance, in the large picture No. 98, where the arrangement seems most carefully thought out and composed without in the least detracting from its truth and naturalness. No. 96, too, is another absolutely truthful picture, the clearing up of the clouds off the distant mountains, and the street half filled with umbrellas put out to dry, conveys just the idea that the artist intended, and carries the stamp of truthful and masterly handling upon its face.

We are told that "Art is born of the marriage of Fact with Idealism." At any rate, Mr. East has spent ten months in Japan in order to paint Nature, and whether he has idealised the "fact" of Japan is not for me to say, but what he has succeeded in doing is this: he has given us more than one hundred pictures of Japanese life and scenery that are absolutely true to nature, that faithfully represent Japan, not as she is painted by her native artists—symbolised, idealised, impressionised, charming, perhaps, but not true—but as she really in fact is. He has succeeded so well, we may be sure, because he has realised the distinction between that which is true to nature as seen with an artist's eye, and that which would *not* be true to nature if rendered by those means which an artist has at his disposal, means which at the best cannot but fall short of the beauty of nature itself. That something which the artist does not reproduce on his paper or his canvas may be something which, if reproduced, could not truthfully represent nature, and the true art consists not in idealising what the artist *can* reproduce, but in leaving out that something which he cannot render so as to suggest its *feeling* though not its sight.

All those who give themselves the pleasure of inspecting Mr. East's pictures, to whatever school they may belong, cannot but go away with the conviction that he has with the most consummate skill brought the truth of nature home both to our eyes and to our minds, and if they want to find fault with his pictures, let them remember that it is Truth they have before them, and that "one beautiful fact of nature incompletely represented is worth any number of completed lies."

Letters to the Editor.

AMATEUR INTOLERANCE.

SIR,—In your issue of the 7th inst., I see the President of the Sheffield Camera Club is reported to have spoken to the following effect.

In their Club the professional element did not enter, not that he would say one word in disparagement of the professional photographer; but he felt strongly that a society could not do well which had both the professional and amateur within its ranks.

As a very old amateur, may I suggest that the President of the Sheffield Camera Club, when next up in town, should pay a friendly visit to a meeting of the Photographic Club, the London and Provincial, or the Camera Club? He will be welcome, I know. Should he do so, I verily believe he will return to Sheffield with broader views than he evidently holds at present.—Yours, etc.,

L. B.

March 10th, 1890.

[NOTE.—The Camera Club is a club of amateur photographers, and the rule regarding their nomination and election is strictly adhered to.—ED: AM: PHOT:]

SIR,—The suggestion that an amateur should lose his amateurship if he receives money just to cover his expenses will surely bear hardly on many an enthusiast. Take my own case. I "potter" a little in photography as a recreation from clerical duties. From the very first, as soon as I got anything at all on plate and paper, I have sent my productions to my mother for sale, "just to cover expenses." She, worthy soul, buys my rubbish without complaining of the transaction, because she knows it costs money; though she used to complain with good reason that my portraits were caricatures, and that she found it difficult to determine which was the right way up of my landscapes.

Now, if the suggested rule is enforced, what am I? I am not an amateur, forsooth, because I receive money. I am not a professional, because I do it as a recreation, and I take it that a professional would sell his productions on their merits—which I certainly could not. Then what am I? Will someone kindly give me a name? Because, perhaps, in a few years, I may be able to enter one of your competitions, and I should like to know in what class to enter myself.

Thanks for the help your paper is to me, removed from any available source of personal help. The other day I sent for a specimen copy of all the photographic periodicals I could hear of, but not one could be compared with yours in attractiveness and in the assistance it gives to befogged dabblers like myself.—Yours faithfully,

PARSON.

* * * *

CONSTRUCTION OF CONDENSERS.

SIR,—I can answer Mr. W. L. Groves' No. 2 question by saying that there are *no* parallel rays issuing from the condensers at all. The rays from the illuminant form conjugate foci; that is to say, they impinge upon the condensers as a cone, and emerge therefrom in another (reversed) cone. My lantern takes all to pieces, and in a darkened room I can observe the path of the rays as revealed by the dust in the air.

My mode of finding the position for the illuminant was this: Placing the negative in its position, I focussed the same to the determined enlargement on the white screen, then fixing the apparatus I removed the negative, and shifted the illuminant backwards and forwards until I had obtained the most evenly white disc. Now removing the enlarging lens, I saw that the light rays came to their focus exactly at the spot previously occupied by the said enlarging lens. Repeated trials with varying enlargements confirmed this experience, so that "the proper place for the illuminant" is the conjugate focus given by the condenser of the enlarging lens, and the best way of finding it is as above given.—Yours truly,

FRED. DAVIS.

SIR,—I much regret that I made the omission in my letter to which Mr. Groves refers to-day. The difficulty he sees is surmounted in the following manner: I have some opaque material (such as is used for focussing cloths), and cut it out and sew it together in the form of a cone, the size of which is, I may

say, immaterial. Then through the smaller portion of the cone I pass the brass tube, and tie it round tightly with silk or fine wire. The large part or base of the cone is nailed so as to enclose the aperture in the side of box. I say that the size of cone is immaterial, but, of course, that is as to largeness; if too small, the tube would not have enough play backwards and forwards. As regards the light coming through the tube, I do not find that to be the case, the diameter of tube being only just large enough to permit the passage of the magnesium ribbon. The fingers which propel the ribbon through the tube would, in any event, stop any light. The plan I adopt in this method of enlarging is, no doubt, crude, but, with a little practice, I am sure it will give your correspondent satisfaction.—Yours, etc.,

March 10th, 1890.

FREDK. W. MUNCEY.

[NOTE.—We have a letter upon this subject from the Hon. J. G. P. Vereker, but have had to prepare a diagram.—ED: AM: PHOT:]

* * * *

DRY PLATES IN SWITZERLAND.

SIR,—We often see it stated that there is a heavy duty levied on dry plates imported by dealers into Switzerland. I would very much like to know from you, sir, or some of your correspondents, whether the same rule applies to films; i.e., is the duty on the glass, or on the sensitive material spread thereon? Also if it applies to plates brought by travellers for private consumption. Baggage is never examined going into Switzerland, but at the frontier station an official sometimes puts his head into the carriage and asks some questions, unintelligible to most folks, which might be, "Have you anything to declare?" As nobody ever seems to answer, the meaning of the question seems not to matter much. Still, it would be satisfactory to know the exact state of the case.—Yours, etc.

GREENWOOD.

* * * *

NEWCASTLE-ON-TYNE PHOTOGRAPHIC EXHIBITION.

SIR,—Since writing you last we have had a great number of applications for space, although exhibitors have till the 1st April for sending in the above.

Some of the leading American amateur photographers have promised to send pictures to our exhibition. Three concerts, several lectures and lantern demonstrations have been arranged, and others are in progress. The catalogue will be illustrated by a number of reproductions of exhibitors' pictures by one of the best processes. Local photographers will be well represented, and nearly all the screens have been let.—I remain, yours truly,

EDGAR G. LEE

(Joint Hon. Sec.)

* * * *

PHOTOGRAPHIC SOCIETY FOR BEDFORD.

SIR,—We are endeavouring to form an amateur photographic society for Bedford, and shall be very glad of any hints through your valuable paper. We should also be very much indebted to any Secretaries who will kindly let us have a copy of their rules, which may aid us in framing those for our own Society.—I am, yours faithfully,

ALEX. KIRBY.

8, Harpur Place, Bedford.

March 5th, 1890.

* * * *

GAS CYLINDERS.

SIR,—I am glad to see that the subject of the safety of gas cylinders is likely to be ventilated in your columns.

I quite expected that Brin's Oxygen Gas Company would have responded to your invitation to give us their experience of compressed gases under these conditions.

Their attention cannot have been called to your article on "Gas Cylinders," or they would most certainly have set at rest what may prove to be the groundless fears of those who would like to use so convenient a form of gasholder. Might I suggest that you should forward them the AMATEUR PHOTOGRAPHER containing that article?

My experience of the use of these cylinders is very small, having only used them twice.

The difficulty I had to contend with was to maintain a sufficiently continuous flow of the gases, as directly a higher pressure was turned on in the hope that it might be controlled by the small jet taps, the pipes were immediately blown off. This, of course, extinguishes one of the gases, and is likely to disturb the audience.

Would the gases be more under control if each gas was turned into its own pressure bag, or are the so-called patent regulators efficient? The latter method surely is the most expensive? Perhaps some of your correspondents or Mr. Hepworth would kindly give us information upon a subject which would be most useful to those using lime-light for enlarging purposes or lantern work.—Yours truly,

W. B. M.

March 4th, 1890.

[NOTE.—We shall be very pleased if Brin's Oxygen Gas Company will give us their experience.—ED: AM: PHOT:]

SIR,—Mr. C. Hethton Lewis, in his letter of the 24th February, expresses surprise that the cylinders are tested by hydraulic pressure. If he will refer to any elementary work on hydrostatics he will find that although water is theoretically an incompressible body, yet when confined in a closed vessel it is able to transmit the pressure communicated to any and equally to every area of the vessel. If the cylinder withstands the pressure of 1,800 lbs. on the square inch when tested by hydraulics, it is evident it will withstand a like pressure when filled with compressed gas. There is no advantage in using compressed gas, since the object of testing the cylinder is to find out the pressure on the square inch capable of being borne by the cylinder, and this can be easily and safely done by means of hydraulics.—Yours truly,

March 4th, 1890.

E. M. VAUGHAN RODERICK.

SIR,—May I be permitted to trespass on your space in order to make some remarks on the subject referred to in Mr. Lewis' letter on page 137?

With his first paragraph I entirely agree; in any case of explosion of a cylinder it is of the greatest importance to find out, if possible, whether or not a mixture of the gases could have taken place, an accident which only the utmost carelessness could occasion.

It is, however, the third paragraph which is most striking, and its contents are evidently the result of an insufficient acquaintance with the laws and methods of physics. In saying this I do not in the least mean to be unkind to Mr. Lewis, and I trust he will not take it in that way, especially as his later remarks show that he has only put forth suggestions on which he seems to invite criticism.

It is quite true that water is practically an incompressible substance (a pressure of 100 atmospheres causing a diminution of only .005 of its original volume), and it is this fact that makes it such a valuable agent in testing the resistance of such things as gas cylinders. In carrying out this test, the gas cylinder is connected with the cylinder of a hydraulic press, the whole system being filled with water, and pressure (10, 20, or 100 atmospheres as required) is applied by means of the piston. Now, by what is known among physicists as Pascal's law, "pressure exerted anywhere on a mass of liquid is transmitted undiminished in all directions, and acts with the same force on all equal surfaces and in a direction at right angles to those surfaces." Thus supposing the area of the piston be 2 sq. ins., and 1,200 lbs. pressure be applied to it (i.e., 600 lbs. per sq. in.), every square inch of the inner surface of the gas cylinder is also subjected to a pressure of 600 lbs. or 40 atmospheres. Now, had gas been used instead of water, it would have been necessary, owing to its extreme compressibility (the volume varies inversely as the pressure, according to Boyle and Mariott's law), to use elaborate machinery to pump in a large quantity in order to get the required pressure (in our supposed case, 40 atmospheres).

But the effects of the pressure on any surface supporting it would be identical, in whichever way it is applied. And it is clear that if a cylinder be tested with double the pressure (as I believe is done with gas cylinders) it is to bear in practice, there will be no risk of it giving way if properly used.

Let us now consider the effects of the application of pressure beyond the limit of resistance of the cyl. (kindly permit this contraction). If pressure be applied and gradually increased, the strain becomes greater and greater until at length that region of the cyl. whose limit is first reached (i.e., the weakest part) gives way, and a rent appears, the strain elsewhere being immediately relieved and so the cyl. merely rips.

But supposing, instead of this gradual increase, the cyl. be filled with an explosive mixture of gases (e.g., hydrogen and oxygen), and a little of this be allowed to escape in the neighbourhood of a flame; an explosion occurs, runs down the pipe, and involves the mass of mixed gases. The result will be the sudden generation of an enormous pressure, many (perhaps many

hundred) times that which the cyl. is constructed to bear, and the force of disruption acting thus suddenly on every part of the internal surface of the cyl. it is literally blown to pieces, the action being so instantaneous that the disruption is too rapid for the relief caused by the giving way of the weakest part to take effect.

The only way to test a cyl. for this sort of strain is to explode mixtures in it, and a cyl. that would stand it would be too unwieldy to be commercially possible.

In the old gas-bag days it was possible to draw one gas into the other bag by accidentally taking the pressure off that bag, but with gas compressed in cylinders we cannot take the pressure off. I will not refer to the method of connecting an o-cyl. to a h-cyl. direct, and so getting, in time, a mixture by diffusion. No one not bent on suicide would try that. The only chance of a mixture occurring seems to me to be that the manufacturers might by mistake pump some of each gas into the same cyl., and I would suggest that they should make it a rule to test every charged cyl. by letting a little gas escape on to a flame immediately before sending it out.

One other possibility I can conceive. The effects of vibration on wrought iron are well known; it causes it gradually to assume the crystalline and more brittle form of cast-iron; this is found to occur in railway axles and girders. Possibly if a cyl. were subjected to constant vibration it might get more and more brittle, and at last yield (it would, I fancy, rip). Again, one can imagine that a sudden jar, such as a fall, might, in its already state of tension, determine a sudden crystallisation, a sudden large diminution of resistance equivalent to a sudden large increase of pressure, and so violent disruption. I take it, however, that these are rather theoretical than practical possibilities, scarcely admitting the use of the word dangers.

As to Mr. Lewis' suggested experiment, all I can say to the first is—try it! I expect the blows would break the bottle before the pressure, but I don't know. Anyhow in this, as in the next, the illustration is scarcely fair, glass and wrought iron being so very different in structure. The heated bottle would certainly burst and probably cause considerable trouble in collecting the bits. It may be interesting to compare the results of Major Williams' experiments on shells filled with water and put out to freeze (*vide* Deschanel's "Physics") with the effects produced by exploding similar shells by a charge of gunpowder.

With regard to rust, water only causes it by virtue of the oxygen usually dissolved in it. Oxygen is said not to attack iron unless some (if only the slightest trace) of water be present. Even then the first layer of oxide formed protects the underlying iron. Obviously, it is best to thoroughly dry the cyl. after testing, and to charge it with carefully dried gas.

This note has spun itself out beyond my original intentions, so I must conclude with apologies for its length, and remain, sir, yours truly,
ERNEST H. CARTWRIGHT.
March 3rd, 1890.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, March 6th, Mr. Pringle gave an address on "The Optical Lantern. Mr. Francis Cobb occupied the chair.

Previous to the lecture a handsome testimonial, silver jug and three goblets, was presented by the members to Mr. E. G. Spiers, as a friendly recognition of his late valuable services as Hon. Secretary to the Camera Club Company.

The Secretary handed round a copy of the work called "Giphantia," published in 1761, in which was found the singular forecast of photography read at a previous meeting. The book, which had been lent by Mr. A. C. Lyster, is a translation from the French work "Giphantia," by Tiphaigne de la Roche, published at Cherbourg. The Secretary also handed round a convenient little actinometer arranged as a small printing frame, in which a small scale of letters of different densities, printed on silver paper, served as the indication of sufficient exposure for printing in platinum. He believed the instrument would be brought out by the Platinotype Company. Mr. Charters White also exhibited a series of photographs bearing on the subject treated of at the

previous meeting—"Photography applied to Medicine and Surgery." The photographs showed in succession the means adopted for patching up and giving artificially a normal appearance to the face in the case of a patient who had suffered severe ravages from cancer.

Mr. Pringle introduced and carried through his subject in a lively and interesting manner. He discussed the general optical system employed in the lantern, treating of the different forms of condensers, of projection lenses, and of the lamps and jets used for the purpose. Condensers could not be too small consistent with reasonable covering of the slide. The projection lens should be one of flat field, and should transmit the maximum of light. Lantern bodies, he thought, were absurdly large, and he exhibited two, one of which, a practical instrument by Mr. Beard, would go into a box 10 inches cube. "Cottages" were very well for public lectures. He also showed a double lantern specially adapted for scientific lectures or demonstrations, and a historical set of jets and lights, including the Beechey jet, one of the oxycalcium system, and several samples of blow-through jets. The demonstration of the working of Mr. Albert Scott's gasoline saturator and jet was of great interest to the meeting, the light obtained being very excellent. Mr. Beard also showed the working of the Broughton ether tank, etc.

Mr. Pringle referred to many other points of interest connected with difficulties and phenomena in lantern work, and treated of the choice and use of limes, the making of gases, regulators, pressure gauges, carriers and screens.

Some interesting remarks by Mr. J. Traill Taylor followed, and in the discussion Messrs. Elder, Baker, Whatton, J. F. Roberts, Beard, and Dr. Patterson took part.

On Thursday, March 20th, there will be an exhibition of lantern slides at the Society of Arts in connection with the Conference.

Winter Work.—XXIII.

BY T. C. HEPWORTH, F.C.S.

PHOTOGRAPHY BY MAGNESIUM LIGHT.

(Continued from page 156.)

THE metal magnesium, although it is combustible when in the form of ribbon or wire, is not easily inflamed, the heat from a burning match being hardly sufficient to bring it to the point of incandescence. Apply a match to a little heap of the powdered metal, and as the fire sluggishly runs from particle to particle, it will feebly glow, without any sign of its wonted radiance. But scatter the same amount of powder in a suitable flame, and we immediately have a blinding light, and something after the nature of an explosion. We may, therefore, look upon magnesium as being inert until its particles are separated in the air, when it at once becomes explosive.

It is only within the past quarter of a century that what are called dust explosions have been made the subject of study and experiment. Attention was first called to the matter by certain mysterious explosions by which flour and other mills had been totally wrecked, or set on fire. Enquiry soon showed that these occurrences were due to flame reaching dust-impregnated air, and experiment proved that such apparently innocuous substances as the dust from carpenters' shops, starch, sugar, buckwheat, flour, oatmeal, etc., when in a state of minute sub-division, and suspended in the air, are most dangerously explosive. It is also known that fine coal dust in dry mines has led to explosion where naked lights are used, and it is now the rule to keep dry workings artificially watered. In America, possibly because of the dryness of the atmosphere, dust explosions have been numerous, and have been attended by loss of life and great loss of property; but the instances in this country are comparatively rare. We may reasonably place magnesium

among the dusts that are liable to explosion when each particle is separated from its neighbour and is surrounded by the diluted oxygen of the atmosphere.

Attempts have been made to increase the light of magnesium by burning it in an atmosphere of pure oxygen. Under such conditions the combustion is far more rapid, and the light is of a most blinding nature. But such increase of radiance is really of no photographic value, for the light given by the metal burnt in ordinary air is quite sufficient to impress a gelatine plate. I shall presently show that far more benefit is derived from increasing the number of flashing lamps rather than attempting to add to the efficiency of any one point of light, and even in these days of commercially-supplied oxygen, it is by no means easy, in the absence of specially contrived apparatus, to burn the metal in oxygen. It was doubtless with a view to obviate this difficulty that various flash-giving powders have been compounded in which some salt, rich in oxygen, has been associated with magnesium. All these should be regarded with suspicion—for some of them are most dangerous—and have led to fatal results. As already pointed out, chlorate of potash is a dangerous thing to handle if mixed with any compound of sulphur. But even when mixed with the magnesium alone, it forms an explosive compound of such energy that if used, in this way, only a very small portion should be fired at one time. The greatest caution should be exercised, too, in guarding the hand from proximity to the flash, for I have learnt by experience that a most painful burn can be the result of carelessness in this respect.

There is no doubt that for photographing interiors of rooms, the flash light is of very great service, and by its aid we are sometimes able to get pictures which would be difficult to obtain in any other way. It is easy enough to get a picture of a room by daylight, if we are particular to exclude that side of the apartment where the windows are. But in some cases the windows with their hangings form the most attractive part of the interior decoration, and if they are excluded the picture is lacking in interest and in fidelity to the original. With a flash light, or for such a purpose with a slow-burning magnesium ribbon lamp, we are able to secure an image of any part of the room which we like, and we can, within certain limits, move the lamp during exposure, or, in the case of a flash-lamp, between successive exposures, and thus exert a softening effect upon the shadows. I remember that some time ago a flash-light picture was exhibited which showed what could be done by judicious arrangement of apparatus of this kind. The picture represented a suite of rooms, one leading into the other, and the last terminating in a conservatory. The rooms were richly decorated and handsomely furnished, each one being separated from the other by *portière* curtains of lace, etc. The charm of the photograph was in the perfect focus of every part, the distant conservatory being as sharply defined in outline as the nearest room. This was brought about by burning magnesium in each of the rooms in succession, and giving, besides a separate exposure for each, a special adjustment of the focussing screw.

For special purposes, such as photographing the interior of a cave or vault of large size, where smoke is not objected to, and where exposure must be of a prolonged character in order to coax detail out of dark corners, some form of pyrotechnic mixture, of which powdered magnesium forms a part, is, I think, the best thing to employ. Here is a compound which will burn well—

Saltpetre	..	..	..	2	ozs.
Sulphur	..	..	..	1	oz.
Antim. sulphide	..	..	..	$\frac{3}{4}$	„
Magnesium	..	..	..	$\frac{1}{2}$	„

This mixture should be pressed into large wooden boxes, such as are used for ointments by druggists, and the lid can be kept on until the moment when the box is required for use, when it can be fired with a slow match or touch-paper. One or two boxes of this kind will give a dazzling blaze of light for several seconds.

It is quite obvious that if we reject the plan of associating the magnesium with some explosive or inflammable compound, and use it alone, we must have some kindling flame into which it must be projected. One of the first plans suggested was to use an ordinary argand gas burner without a chimney, and by means of a central tube placed just within the ring burner, but at a slighter lower level, to blow the magnesium dust into the annular flame. It was asserted that this obviated any waste of the metal, the fact of the flame forming a wall all round it preventing any particle escaping. This I have found in practice not to be correct, for after using such an arrangement I have found particles of unconsumed magnesium lying about the room in abundance.

A far better source of heat is represented by one of those cheap little spirit stoves which can be bought for a few pence, and which consist of a pad of cotton wool, or asbestos held in a metal disc and covered over with brass wire gauze of fine mesh. This metallic pad is saturated with methylated spirit, and when a light is applied the flame given by it is both very large and very hot. Magnesium dust projected into such a fiery furnace is wholly consumed with brilliant light. There is attached to many of the flash contrivances sold a wire-covered pad of this description.

I will now point out how by the aid of one of these cheap spirit stoves or pads a very efficient flash-light apparatus can be made. Procure or make of wood or tin a box about two feet high and one foot square. The size is not of very great importance, but the box should at any rate not be smaller than the measurements given. Bore holes all round the bottom and top edge so as to provide abundant ventilation, and if the box is of wood, let the top at least be made of tin. In the true centre of the bottom of the box, as it stands on end, describe a circle which should be distinctly coloured or otherwise marked so that its place can be readily found. Upon this centre must stand the spirit stove on the little tripod which is sold with it. Immediately over it, that is in the centre of the top of the box, let there be a hole about two inches in diameter. The inside of the box, if not of bright tin, should be lined with silver paper so as to have a good reflecting surface, but the front of the box should be furnished with a frame covered with tracing cloth, which can be put in its place just before the exposure is made, and after the spirit lamp has been charged and lighted. Things being thus arranged, and the camera and sitter being ready for the exposure, the slide of the former is drawn and the lens is uncapped. Now pour sufficient magnesium powder into a perfectly dry teaspoon. Bring the teaspoon over the central hole in the top of the box, and with a glance to see that all is right, simply invert it. The magnesium is, of course, emptied direct into the flame below, with its particles widely separated, and therefore in the best condition for perfect combustion, and the result is a blinding flash of light sufficient for any ordinary exposure in a small room. The object of the tracing cloth screen is to diffuse and soften the light, and to take away those very strong contrasts of light and shade which otherwise make themselves objectionable in this kind of work. A reflecting surface should of course be used on the other side of the figure—as in daylight portraiture in an ordinary room. This apparatus would be brought to the greatest perfection if it were furnished with a chimney by which the smoke could be carried to the open air.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 138.)

EXPERIMENT 19.—Take a piece of stout sheet zinc about 10 cm. (4 ins.) long and 4 cm. ($1\frac{1}{2}$ ins.) broad, and a similar piece of copper; to one end of the zinc fasten one end of a piece of moderately thick covered copper wire, such as is made for electrical purposes, and fasten one end of the sheet of copper to the other end of the wire, which should be about 30 cm. (1 ft.) long. By means of dry thread or fine string, tie the zinc and copper to a small piece of dry wood about 3 mm. (eighth of an inch) thick, as shown in fig. 11. Take a small magnetic needle mounted on a pivot (a pocket compass will do), and bend the copper wire so that it passes round the needle in the manner shown.

FIG. 11.

Now it is known that if an electric current passes along a wire placed over a magnetic needle, the latter swings round and tends to take up a position at right angles to the direction of the current. By making the wire pass twice over the needle in the same direction and once under it in the opposite direction, we multiply the effect exerted on the needle by any current which may pass along the wire. Arrange the coil of wire so that when the needle is at rest the wire is parallel with it, and passes directly over it and under it. Then, keeping the wire and the needle in the same position, immerse the zinc and copper to a depth of about 5 cm. (2 ins.) in a beaker containing sulphuric acid diluted with twenty times its bulk of water. That some chemical change takes place is shown by the evolution of gas from the surface of the copper, and the fact that the needle swings round and takes up a new position, *x x*, shows that an electric current passes along the wire.

From this experiment we learn—(1) that *under certain conditions chemical action develops an electric current*, (2) One of the ways in which an electric current can be detected.

The arrangement of zinc, copper, and connecting wire used in this experiment is the simplest form of a galvanic battery.

We have now become acquainted, by our own observations, with the principal outward signs of chemical changes, which may be briefly summed up as change in appearance, change of state, development of heat and light or of heat alone, and the development of electricity.

We must next consider the conditions under which chemical changes will take place. We have seen by previous experiments that gases will act upon one another and that liquids also react readily; we have still to learn whether any chemical action will take place between solids.

EXPERIMENT 20.—Powder separately small quantities of dry potassium iodide and mercuric chloride, and then shake the powders together in a dry test-tube. *Observe* that some particles of a scarlet substance are formed, but the change does not go very far. Turn the mixture into a dry mortar, and grind it up well, using considerable pressure. *Observe* that the action proceeds much further and the mass of the mixture becomes scarlet. Compare these results with the action of a solution of mercuric chloride on a solution of potassium iodide (experiment 15).

EXPERIMENT 21.—Make a precisely similar experiment with potassium iodide and lead nitrate. In this case the product will be yellow. Compare the results with the action of a solution of potassium iodide on a solution of lead nitrate (experiment 16).

From these experiments we learn that *chemical action will take place between solid substances, but only to a very limited extent*. Even after the solids have been well ground up together, the action is by no means complete; if a small quantity of water is added and the mixture is ground up with it, the much deeper colour which is produced shows that the change has gone much further. It is found, however, that if many mixtures of this kind are subjected to extremely high pressure the chemical reaction between them becomes complete.

In order that chemical action may take place at all, *it is essential that the particles of the substances concerned should come into the most intimate possible contact with one another*; a degree of separation too small to be recognised by the most powerful microscopes is sufficient to prevent any change taking place. The mobility of the particles of gases and liquids enables them to mix perfectly, and the necessary closeness of contact is ensured. It follows that if substances can act chemically upon one another such action will take place readily enough if they are in the liquid or gaseous condition, provided that the other conditions are favourable. The particles of solids, on the contrary, have no freedom of motion, and even in the very finest powder the substances are only in contact at a limited number of points, as we can easily see if we examine the powder with a good microscope. Chemical change can only take place at these points; it cannot spread to the particles which are not in contact with one another, and hence remains incomplete. By grinding the particles together, fresh surfaces are brought into contact, and the action proceeds, but it is only under extremely high pressure that the contact becomes so intimate that the change can become complete. If, however, the solids are dissolved in some suitable liquid, they behave as part of the liquid, and their particles have the mobility favourable to chemical change. It follows that unless there is some objection to such a course, solid substances which are required to act upon one another should be converted into liquids either by the action of heat or by dissolving them in some suitable solvent.

The experiments already performed have shown that many substances react as soon as they come into contact even at the ordinary temperature, but this is not always the case. A candle, a piece of coal, or a piece of sulphur may remain exposed to the air for any length of time, without undergoing any appreciable alteration, but if they are heated up to a certain point a chemical change begins, *i.e.*, they take fire and burn away.

EXPERIMENT 22.—Mix some copper turnings with half their weight of sulphur, place the mixture in a dry test-tube,

and allow it to remain for some time at the ordinary temperature. *Observe* that no action takes place. Now heat the tube, having first placed the burner or spirit lamp on an old plate to catch the contents of the tube if it should crack. *Observe* that when the mixture in the tube has been heated up to a certain point energetic action takes place, and the mixture becomes red hot. *Many substances undergo no change at the ordinary temperature, and will react only when their temperature is raised to a certain point.*

EXPERIMENT 23.—Dissolve 2 grammes (30 grs.) of lump sugar, and 2 grammes of potassium dichromate in 100 c.c. (1,500 fl. grs.) of water, either in the dark-room or by gas light. Place one half of the solution in complete darkness, and expose the other half to sunlight. *Observe* that the portion kept in the dark remains unchanged, but the portion exposed to light undergoes considerable alteration, and becomes turbid and dark coloured.

Many chemical changes which will not take place in the dark will take place when the substances are exposed to sunlight.

Hambling Papers.—X.

BY W. K. BURTON.

ORTHOCHROMATIC PLATES.

THESE plates do not seem to have done so much for ordinary landscape work as was at one time expected. The reason, I believe, is not far to seek. So far as landscape work is concerned, there are two objects in using orthochromatic plates. One is to get out the greens more fully, the other is to get the distances clearer. No one who has anything of the artist in him will try to get distances as crisp and bold as foreground objects, although that was the ambition of many photographers at one time; but all object to the exaggeration of the thin bluish veil that gives the idea of distance, till it obliterates the detail of the distance altogether, or perhaps makes it indistinguishable from the sky, that takes place when ordinary plates are used. Now, the fact is that orthochromatic plates will effect neither of these objects, other than to a very slight degree, unless a yellow screen is used. There may be a very little improvement in the yellows and greens, but it is less than we might expect from the considerable increase in yellow sensitiveness that the application of the best stains gives. This increase would show a considerable effect if we were dealing with *pure* green, but the truth is that, in the case of most kinds of foliage, we are not dealing with pure green at all, but with a mixture of green with so much white that the green scarcely needs to be considered at all as a factor in the photographic work. It is not always so, however, as I observed in rather a curious way the other day. I was taking a group on a turf-covered piece of ground close to my house. The turf appeared to be of the usual even green that healthy turf generally shows, but in the photograph it came out wonderfully patchy, so patchy as almost to spoil the picture by attracting attention to the pieballed appearance of the turf. I thought at first that the plate was at fault, but a second exposure brought out exactly the same appearance, so I then knew that there must be some actual difference in the grass. On a close examination it was evident that there was such. The ground had apparently been sown with two different kinds of grass. Unfortunately, I am not learned in such things, and cannot tell what kinds they were, but the next thing that I tried produced the most curious effect. I took a small piece of "red-stained" glass, and looked through it at the grass. Instantly it appeared pieballed, as it had in

the photograph, one kind of grass appearing as *absolutely* black spots on the other, which (due, of course, to its reflecting white light, all of which but the red was filtered out by the glass) appeared bright red. The effect of looking at the grass alternately with the naked eye and through the red glass was almost magical, the perfectly uniform tint suddenly springing into so strongly variegated a one.

In this case I tried the effect of an orthochromatic plate without a yellow screen, and found that, in the case of the *pure* green—that which appeared black through the red glass, there was a considerable improvement, the rendering being no longer clear glass; in the case of the impure green—that which reflected a deal of white light—there was no difference in the rendering at all. In other words, we would, in the matter of the greens, get a decided advantage, even without the use of a screen, if the greens were pure. We get no appreciable advantage when they are impure. Pure greens, such as that shown in the case of the patches of grass are, however, very uncommon, although they are sometimes to be met with.

It may be interesting to notice that there is the same difference between pure and mixed colours in the case of flowers, some of the colours being exceptionally pure. It is a thing both interesting and beautiful to look at a set of coloured flowers through different coloured pieces of glass, each letting through, so far as possible, the colour of one part of the spectrum only. Of course there are changes in contrast due to pure colour only, but there are others that are sometimes almost startling, due to differences in the purity of colours apparently almost the same. Two colours that appear to differ only by the faintest shade, suddenly, on looking at the flower through the glass, stand out in the strongest contrast.

So much for the yellow. As for the blue, including the haze of the distance, it is only necessary to say that, as orthochromatising does not, as a rule, reduce the sensitiveness to blue at all, that colour acts in the case of orthochromatic plates with the same amount of proportionate over-intensity as in the case of ordinary plates, unless a yellow screen be used to filter out the greater part of it. If the greens were *pure*, there would be some improvement *relatively*, but with them as they are there is little or no improvement.

The moral of all this is, then, that orthochromatic plates are of little use for landscape work without a colour screen; or rather, it is all only an explanation of the fact that all who have tried such plates without a screen for such work have probably found out for themselves. I think most, also, will agree with me that, in the present state of orthochromatic photography, the advantages to be gained by the use of orthochromatic plates along with the yellow screen are in the case of ordinary work too dearly bought, at the expense of the disadvantages and additional difficulties. The use of a yellow screen, even if ever so well made, *must* interfere with the optical properties of a lens, more or less; but, what is perhaps more serious, no one shade of yellow screen will actually supplement the shortcomings of orthochromatic plates; the thing is a make-shift after all, and it is necessary to use different depths of yellow tint for different subjects. I see that one optician has recently introduced a set, or series, of pieces of optically ground glass of tints increasing in intensity, so that whichever is thought best may be used. In spite of all that I have just said, I fully recognise the usefulness of this arrangement.

Improvements are being made perhaps more rapidly in orthochromatic photography than in anything else connected with the art, and we may, I have no doubt, hope for a very perfect plate before long—either one that shall be truly orthochromatic, giving the true values for the different

colours without the use of any screen at all, or one that is capable of being duly supplemented by the use of some one light tint, used as a screen. The first may be too good to hope for; if the latter were to come to pass, and there were no objection to the use of the plates in any other way, it would be quite worth while to use nothing but orthochromatic plates, and to permanently tint one or the other of the surfaces of our lenses. Or it might be worth while to glaze studios with a light yellow-coloured glass.

This latter is a thing that sounds a little strange at first, but it is not so wild a notion after all. Yellow lighting was long ago recommended, in the copying of *pictures*, instead of the use of a yellow screen, so that the working of the lens should not be in any way interfered with.

How strange it would seem to those who, in the olden days, glazed their studios *blue*—some under the mistaken impression that thereby they increased the actinic power of the light, others doing it merely to reduce the excessive glare without appreciably increasing the exposure—to hear it suggested that, in all seriousness, the studios might, with advantage, be glazed with *yellow*!

I do not want anything that I have said to be taken as against the use of orthochromatic plates for a hundred *special* purposes, and what I say against their use for general purposes at the present time must be taken as an expression merely of my own opinion, always liable to change.

(To be continued.)

Competitive Papers.—No. XII.

ENLARGEMENTS.

Third Prize.—F. C. THOMPSON.

If we produce a transparency from a picture placed before a camera, and then, with the camera still in position, substitute the transparency for the ground glass and a white screen for the picture, we shall, on illuminating the transparency from behind, get an exact reproduction of the original picture, and precisely in focus. And this will be the case whatever the original distances may have been. The image and the object are in all cases interchangeable. But without going to the above trouble, a small lamp and a sheet of white cardboard will prove the truth of the proposition experimentally, while we may be convinced of it from theoretical considerations, if we think that whatever course a ray of light may take, there can be no reason why another ray started in the opposite direction will not trace for itself precisely the same course, but opposite in direction. Thus whenever we "focus" an image, two points are involved, and each is the focus of the other; they are therefore called 'conjugate' foci, and their distances from the lens are connected together by a very simple relation, whatever these distances may be actually. A flat picture was taken in the preliminary illustration, because its points lie all in one plane; when a landscape is before a camera, we have points in an infinite number of planes, which will be focussed at different distances on the other side of the lens. By the aid of a "stop," however, we are able to effect such a compromise between the distances that the whole picture is said to be "in focus." This is not the place to discuss the properties of lenses in general; but it may just be pointed out that the margin of a lens refracts light more than the central portion; this difference of refractive power enables the optician, by paying great attention to the curves of the lens or lenses, to so construct a lens, or combination, that with the help of a stop the greater number of points in a view before a lens may be brought to a focus in one plane, an effect of the lens called "flatness of field." If the object be at an infinite distance, as a star, or, for practical purposes, the sun or even distant mountains, the rays of light from it are parallel, and the image produced is at an invariable point called the "principal focus" of the lens, or in speaking of a photographic combination, the "equivalent focus"—in either case, commonly referred to as "the focus." The term "equivalent" focus has reference to the fact that a single lens

may be found which will produce the same effect on parallel rays—that is, give an image of the same size as any given combination of lenses, and the focal length of the latter for parallel rays is said to be equivalent to that of the single lens; and this distance if applied between the compound lens and its image will be found to give a point which practically corresponds with the position of the diaphragm. As the object is made to approach the lens, its image recedes from the lens on the other side, and becomes larger, until when image and object are equidistant from the lens, they are of equal size. A further approach of the object causes the image to recede further, and with the object at the principal focus, the rays on the other side are of course parallel. Here a fact which can be proved by very elementary mathematics should be carefully noted; the size of the image bears the same proportion to the size of the object as the distance of the former bears to that of the latter. This fact we shall soon have occasion to make use of.

The formula expressing the relation between the conjugate foci of a lens is

$$\frac{1}{d} + \frac{1}{D} = \frac{1}{f},$$

where d , D , and f are the respective distances of the image, the object, and the principal focus, from the lens. With this equation we can construct a table for enlargement purposes with any particular lens, or we may make use of the formula directly for any given amplification. Suppose, *e.g.*, we intend to use a lens whose equivalent focus is 6 ins., and the enlargement to be from quarter-plate to 20 by 15 ins., *i.e.*, 5 diameters. This amplification tells us that the focussing screen must be five times further away from the lens (or diaphragm) than the negative is. Thus putting $5x$ and x for these distances, and 6 for f in the above equation, we get

$$\frac{1}{x} + \frac{1}{5x} = \frac{1}{6}$$

whence $x = 7\frac{1}{2}$ ins. and $5x = 36$ ins. The few figures necessary to solve the equation will suggest to any one the following rule: Multiply the equivalent focus of the lens by one more than the degree of enlargement required; the product will be the distance of the focussing screen, and divided by the amplification, will give the necessary distance of the negative from the lens.

To find the equivalent focus of a lens, we may of course focus an object at any distance; measure the distances of image and object, and find f from the above equation. Or we may proceed thus:—With a pencil, mark inches on the focussing screen, and then putting the inch measure before the camera, adjust the distances, so that its focussed image coincides exactly with the marks made on the screen; then remove the lens, and measure carefully the distance between the inch measure and ground glass; one-fourth of this distance is the principal focus required. An application of the fundamental optical formula given above will demonstrate the accuracy of this plan.

Before leaving the optical part of the subject, reference must again be made to the fact that a ray of light turned back on itself will trace backwards its original path; or what is the same thing, whatever the path taken by a ray, another ray in the opposite direction will follow the same path. From this it follows that if a distorting lens be used to produce a picture, and the picture be enlarged to the size of the object by the same lens, passing the light through the opposite way, the resulting enlargement will be free from distortion.

Obviously this will not be strictly true for any size less than the natural size, but it will be the case practically. This settles at once the point as to what lens is best for enlarging, unless one specially constructed for projecting be used. Any lens, too, giving a flat field is good, while an amateur possessing only one lens, and that a single one, need not be deterred from using it for enlarging, knowing that, used in the way indicated and with a small stop, it will correct its own errors of distortion. A lens of the rapid rectilinear type can, of course, be used with a large aperture—no small convenience in actual manipulation.

Undoubtedly, the simplest way of enlarging by means of daylight is to construct a frame to carry the negative in front of a hole cut in the shutter of the dark-room. The frame should slant so that the negative commands unbroken sky, or a reflector of glass or cardboard may be arranged outside, and controlled from within by a string, so as to reflect the largest amount of light through the negative. Projecting from underneath the

perforation in the shutter should be a board about 12 or 15 ins. long, with a square to carry the lens as an ordinary camera front does, sliding along its length. If the board is attached to the shutter by such a hinge as to allow it to be removed when not in use, the arrangement will be very convenient, and it may be adjusted precisely at right angles to the negative by a strut placed underneath. The square carrying the lens should have a "rising front" arrangement, as, of course, it is essential that the axis of the lens should pass through the central point of the negative. Various methods of clamping the square carrying the lens will suggest themselves to the ingenious worker; space will not allow of saying more here than that the writer uses a slot in the middle of the projecting board, and through this a clamping screw passes. Of course, no light must be allowed in the room but that passing through the lens (the red pane or panes excepted), and to prevent this, a cone of black velvet may be made and placed between the lens and negative, or a bellows of the ordinary form, or, if the distance is not great, the focussing cloth will do duty effectually. Or again, in place of all this, a camera may be placed on the projecting board with its back opened close to the negative, and lens on in front as usual. On a table in front of the window should be an easel capable of adjustment, so as to be accurately parallel with the negative, and carrying a flat board as large as the largest picture to be produced. If the enlargement is to be on paper direct, the image may be focussed on a sheet of white paper pinned on this board, or if glass is to be used, a sheet of glass of the proper size and thickness covered with white paper makes a most excellent focussing screen, and if fastened in its place by drawing pins at its edge, the sensitive plate may be made to occupy its plane with a minimum of trouble. The two distances involved in the enlargement are arranged, and the final adjustment made by moving lens or easel, as found convenient.

We are now in a position to discuss separately the production of an enlarged negative, and of a positive print direct.

Making an Enlarged Negative.—The first essential is a good transparent positive, for which ordinary gelatine plates may be used. It may be of the same size as the original negative, and produced by contact printing, or as large as the intended negative; the first plan offering advantages on the score of economy, and the second in ease of remedying any defect either of the positive itself, or the original negative. From the large positive a negative is made by contact. For the enlarged picture, whether positive or negative, any of the numerous films now in the market may be used, but it is essential that the small one should be very brilliant and transparent, and glass offers many advantages in this direction.

Most beautiful enlarged negatives may be made direct without the intervention of a positive by means of collodion (bath or emulsion), followed by alkaline development. The plate is developed and washed, and dilute nitric acid then poured over it, which dissolves the deposit. It is then washed, taken into the light, and developed again, when the parts not previously acted on by the light become so now, and by the action of the developer, a deposit is produced and a negative is the result. The enlarged negative gives facility for producing prints by any of the slow processes at any time without setting up special apparatus; but in spite of these advantages, the amateur will probably in most cases prefer the

Production of Enlarged Positives Direct.—Here the slow printing processes are almost out of court altogether. The writer has, however, produced enlargements of about four diameters on albumenised paper, with an exposure of between a week and a fortnight in the long days of July, and with less exposure on gelatino-citro-chloride paper; but these results must be looked upon as simply experiments, especially as the lack of permanency in albumenised paper makes it more unsuitable for large pictures than for small ones. A separate paper is to be devoted to the gelatino-bromide process, and, presuming that this is to include processes with the other haloid compounds of silver, none of these processes will be described here.

The Carbon Process is available where the enlargement is not great, say about two or three times, giving an exposure of about one-sixth of that judged necessary in the printing frame, and keeping in the dark about three days before development. The action of the light once set up continues in the dark, and at the end of that time is equivalent to a full exposure.

Dusting-on Process on Opal Glass.—A small transparency is first produced, and the enlargement made from this, the process

giving a picture of the same character as the original; that is, from a positive a positive will be produced. The plate is flooded with a sensitising solution similar to the following:

Dextrine	..	..	..	..	..	40	grs.
White sugar	..	..	..	..	..	50	"
Ammonium bichromate	..	..	..	..	..	20	"
Glycerine	..	..	..	..	..	3 to 5	drops.
Water	..	..	..	..	..	2	ozs.

The excess is drained off, and the plate dried in a warm room, or in a water oven, or carefully over a lamp. It is then exposed for a few minutes to the image from the transparency, after which finely powdered black-lead is very carefully brushed over it by means of a soft camel's-hair brush. The powder should adhere to those portions where the light has not acted, and if this be not the case, the brushing should be continued in a damper atmosphere, as that of a cellar. Local intensity may be given by very gentle breathing on parts as the brushing goes on. If, however, the black-lead shows the least tendency to attach itself to the whites of the picture, the plate should at once be removed to the drier atmosphere. In fact, success may be said to depend more on the management of the atmosphere than anything else, though it is very plain that the artistic appearance of the result depends much on the skill used in brushing in the powder. When the image is judged satisfactory, the plate is collodionised, washed in dilute hydrochloric acid, then in clear water, and dried.

Thin Transparencies on Glass, Backed with Paper.—Very pretty effects may be produced by making a very thin transparency on an ordinary gelatine plate, and fastening a sheet of paper in contact with the film. Ferrous oxalate by preference for development, as the image is blacker. The paper used for backing may be white or tinted, rough or smooth, and the effect further varied by working upon it with a pencil or crayons. This process has the advantage of giving the shadows a "juicy" black, instead of the dry washed-out appearance often so difficult to avoid with the gelatino-bromide papers. The effects may be further varied by choosing plate and developer so as to get a coloured image; or the deposit produced by ferrous oxalate may be modified very considerably in colour by uranium. After making the plate absolutely free from hypo—and too much pains cannot be taken for this—it is immersed in a solution containing 4 or 5 grs. per ounce of uranium nitrate, and a like quantity of potassium ferricyanide (*red prussiate of potash*), when in a few minutes it begins to get slightly brown in colour. According to the time it is left in, it will assume a chocolate brown to a bright red. The solution should be kept in motion continually, and when the most pleasing tint is obtained, the plate is immediately removed and washed in clean water. The effect may be removed, if considered unsatisfactory, by soaking in a weak solution of carbonate of soda followed by an alum bath if the edges show any sign of frilling.

Collodion Transfer Process.—This is closely akin to the foregoing. It is mentioned chiefly to make the list fairly complete, as it is impossible to describe it in detail in a short paragraph; and those amateurs who are familiar with collodion will need no information being given here, while those unfamiliar with it are certainly not recommended to begin their acquaintance with it by the production of enlarged pictures. Briefly, an enlarged positive is produced by collodion, and a sheet of gelatined paper pressed in contact with the film. On drying, the paper may be stripped from the glass, bringing the picture with it. Or the plate may be allowed to dry, and be then backed with a sheet of paper as described above.

—◆◆◆◆◆—
SHEFFIELD PHOTOGRAPHIC EXHIBITION.—Under the auspices of the Sheffield Photographic Society, an exhibition of photographic slides was given last week in aid of the building fund of the Public Hospital and Dispensary. The slides were mostly the work of members of the Society, the majority being of local interest, and were exhibited by means of a lantern belonging to Mr. W. D. Forsdike. Mr. B. J. Taylor presided, and there was a large attendance. During the exhibition the slides were described and commented upon by Mr. Alleyne Reynolds. The first series of photographs consisted of views in Sheffield, most of them being instantaneous street scenes. Following these were a number of pictures taken in the suburbs, and afterwards photographs of Derbyshire views were exhibited. The exhibition concluded with a number of miscellaneous views.

Our Contemporaries at Home and Abroad.

THE *Camera* contains articles on "Photographic Chemicals," "Exposure and Development," "The Salting and Fixing of Drawing and other Commercial Papers," "English Church Architecture as a Subject for Photography," etc.

L'*Amateur Photographe* (Paris) contains a most amusing article on "What it Cost to Photograph a Balloon," "Study of the Operations of Photography," "Photography and its Industrial Applications," "Practical Manipulations," "Photography of Interiors," etc.

The *British Journal of Photography*, in an article on "Large Direct Portraiture," says, "It must not for a moment be imagined that in this or in the previous article we deprecate the use of combination lenses for large portraiture, for we do not. Our object has been to protest against the employment of lenses of short focus for taking large direct portraits. It stands to reason that if a lens of certain focus is necessary to take a pleasing, say, cabinet portrait, a comparatively much shorter one must not be expected to yield large ones which are satisfactory. More especially does this obtain when it is considered that large lenses are not, and never can be, made so perfect as small ones; and, added to this, the unavoidable inferiority increases with the size of the instrument." Article: "Oxygen and Chlorate of Potash," "Celluloid and Electricity," "The American Eclipse Expedition at Cape Town," "The Silver Printing Bath," "Photography in an Age of Movement," "Eikonogen as a Developer in Practice" (concluded), "The Influence of Temperature on Photographic Manipulations," etc.

The *Photographic News*, in an article on "Some Relations between Fine Art and Photography" (Philip H. Newman), says, "Firstly, I have endeavoured to show that photography has exercised, and is exercising, for good or ill, an influence on fine art, and that this influence has not been altogether for good in the past, more especially as having occasioned an attention to detail to the prejudice of unity and breadth. Secondly, I express a confident belief that an increasing love of fragmentary studies by photography and painting is tending to narrow the scope of art generally. Thirdly, I insist that, in regard to Coleridge's definition of painting as being 'something between a thought and a thing,' the *thought* in this country is too often a minus quantity. Moreover, although we have seen that very earnest endeavours have been made from time to time to achieve a very high art ideal indeed with the camera, yet much carelessness and want of training, external to technique, have brought it into artistic disrepute, and made it very productive, in an artistic sense, of bad work. For this reason it behoves us to be more eclectic, not only for the sake of the future of photography, but for the sake of art itself, and it would be well were the photographic societies to offer more prizes for really artistic work, and obtain, where necessary, acknowledged artistic assistance in making the awards." Articles: "An Unsolved Problem in the History of Photography," "Vocation of an Amateur Photographer," "Reactions of Various Developers," "Toning with Metals of the Platinum Group," "A New Photo-Lithographic Transfer Paper," "Professor Piazzi Smyth on Figures in Photographs," "Ruskin on Beauty," "Flash Powder Explosions," etc.

The *Beacon* (Chicago), speaking of the "Photographer of the Future" says: "It would be impracticable to restore the system of apprenticeship which, so far as ordinary trades are concerned, in spite of all that is said and written of technical schools, is the only method by which trades can be properly taught, and if it were, the masters competent to teach are too few to meet the requirements. But, properly equipped and rightly managed, schools of photography could, we think, be made to answer the purpose. Such a school should contain all the appliances of an ordinary studio, facilities for enlarging and copying of all kinds; a suitably equipped chemical laboratory and lecture room, with accommodation for both theoretical and practical instruction; and models, specimens, and all necessary appliances for the proper teaching of the principles applicable to art." Articles: "A New Limelight," "Photographing the Eclipse," "Sensitiveness of Salts of Iron," "The Optical Lantern," "The Lights of Other Days," "How I Paint a Portrait," etc.

The *Photographic Times* (New York) contains articles on "Photo-zincography," "Long and Short Focus Lenses," and the "Silver Printing Bath," whilst amongst its shorter notes it gives the following, which may be found useful on some occasions: "We quote from the Journal of the French Photographic Society the following receipt for a pyrotechnic mixture, credited to the *Chemiker Zeitung*, which is said to make a light visible the distance of 100 kilometres in clear weather. The ingredients are as follows:

Magnesium powder	..	..	..	..	20 parts.
Nitrate of baryta	..	..	..	..	30 "
Flour of sulphur	..	..	..	..	4 "
Beef suet	..	..	..	..	7 "

Mix the different materials in the melted suet. This amount, moulded into a box of zinc, one-tenth of a metre in height and seven one-hundredths of a meter in diameter, will burn twenty seconds with a light equal to 20,000 candles. The weight of the whole is about a pound, and, as the magnesium amounts to about one-third of the weight, it will be easy to calculate the cost of this powerful illuminant."

The *American Lithographer and Printer*, in article on "Gelatin Plates for Photo-Mechanical Purposes," says, "In the case of reproductions from drawings and other line subjects, clearness, and especially vigour, is obtained more easily and with more certainty, without intensifying, than with collodion plates, if the following method, as recommended by Herr F. Wilde, be employed: The plate is exposed twice as long as would be required for ordinary photographs, and to the developing solution is added from the beginning the following iodo-bromide restrainer, in the proportion of 20 cc. to 25 cc. to each 200 cc. of developer.

SOLUTION I.

Iodine, sublimed	..	..	..	..	1 grm.
Alcohol	..	..	..	..	200 cc.

SOLUTION II.

Potassium bromide	..	..	..	..	14 grms.
Water	..	..	..	..	200 cc.

Solutions I. and II. are mixed, and the mixture is added to the developer in the above given proportion. By prolonged development negatives of such a vigour and density may be obtained as are very difficult and not always with equal certainty obtainable on wet collodion plates, even with subsequent intensification. If these directions are carefully observed, the gelatine dry plates are decidedly preferable to wet collodion plates for this special purpose." It also contains articles on "Litho-Photogravure" and "Stellar Photography."

Science Notes.

MESSRS. G. LUNGE and T. WIERNIK have re-determined the specific gravity of solutions of ammonia. They find that at a temperature of 59° F. the "liquor ammoniæ" of spec. grav. '880 contains 35½ per cent. of the true ammonia gas; at sp. gr. of '910 only 25 per cent.; and at '960, only 10 per cent. Moral—dilute your ammonia immediately after purchasing with an equal volume of water, and keep it in a bottle having a ground-glass stopper. Otherwise your "volatile alkali" (as ammonia has well been called) will speedily fly away, and your solution will be of only half the strength which you imagine it to be.

Professor Holden has recently improved the photographic apparatus attached to the famous Lick telescope in California. The plates now used are mostly 8 by 10 inches, and they are supported within the tube of the telescope, on a compound slide-rest, so that the image of any celestial object can be kept steady on the same part of the plate. It is found that the negatives of the moon can be studied with a microscope magnifying 570 diameters. "That is, it is practicable for an observer to sit in his study and to examine the lunar surface with a magnifying power of 570 diameters as often and as long as he pleases. Even more than this is true. Mr. Barnard has been kind enough to make positive enlargements on glass for me, which show the moon twice as large as in the principal focus. An eyepiece of 1 inch equivalent focus is not too high to examine some features of these enlargements (and as they are *positives*, they show the surface in its true light and colour). Thus it is practicable to see the lunar surface under excellent definition, and with a

power of more than 1,100 diameters, whenever one pleases and as long as one pleases."

"I have no hesitation in saying that a study of our moon negatives alone is capable of giving more information regarding the lunar surface than has been obtained by all the laborious years of observation by the most famous observers—Mädler, Lohrmann, Schmidt, and others now living."

Professor Holden offers a set of these "lunar negatives" to our Astronomical Society, "in the hope that some *lonely and athletic* student may be willing to devote the two or three years necessary to their thorough and exhaustive study." The present working staff at the Lick Observatory is unable to do more than produce the *materials* for such a study.

The British Association has appointed a Committee for the Collection of Geological Photographs. The Hon. Secretary is Mr. O. W. Jeffs, 12, Queen's Road, Rock Ferry, Cheshire. We recommend any of our readers who possess good photographs of rocks, etc., to send prints to Mr. Jeffs. Any aid that photography can render to science should be rendered most willingly, for mutual benefit must result.

Captain Abney will lecture at the Royal Institution upon "Colour, and its Chemical Action," on Saturdays, April 19th, 26th, and May 3rd. We have no doubt that valuable light will be thrown upon the subject of orthochromatic photography.

A meteorologist who has been studying the Greenwich observations of the weather for the past century states that a mild winter is customarily followed by a warm summer. If so, there is good hope for photographers in the coming season, for the winter now nearly over has been unusually mild—the month of January notably so.

It is not only when oxygen gas is stored under high pressure in steel cylinders that accidents may happen. It has frequently caused explosions during its preparation. The latest of these took place last month at Lexington, in Illinois, where Professor Jess, of the High School, was making the gas before his chemical class, using a piece of gas-pipe eight inches long and two inches in diameter as a retort. After placing the usual mixture of chlorate of potash and oxide of manganese in this primitive utensil, heat was applied. After two minutes the retort blew up like a bomb-shell, terribly injuring the Professor and several others who were nearest, while about twenty of the pupils were injured. The cause is believed to have been some mistake in the nature of the chemicals used. If, for example, powdered charcoal or sulphide of antimony be used in the place of the black oxide of manganese (which they much resemble in appearance), an explosion is certain. The moral is that the chemicals should always be tested first, by heating a little of the mixture on a fire-shovel or in a test-tube. If it gives off the oxygen gas quietly, all is right.

A Continental scientist has proposed an ingenious plan for obtaining that desideratum—the production of *stereoscopic effect* in the picture thrown on a screen by an optical lantern. He takes the two pictures produced by a stereoscopic camera and makes a lantern slide from each. The two slides are then placed one in each lantern of a biunial, and their joint images are carefully centred on the screen. The effect, so far, is simply to produce a confused picture, owing to the images overlapping. But now a piece of pure red glass is placed in one lantern, and a piece of pure green in the other. Still the double picture is visible on the screen. But now let the observer put on a pair of spectacles having a piece of red glass facing the one eye, and a piece of green glass facing the other; each eye then sees one image only (as in nature), *but the two images coalesce in the brain* and produce a stereoscopic effect.

One difficulty in this plan would be the procuring of glass of pure colours. Another, the tint of the resulting image. It occurs to us that yellow and blue glass might be preferable to red and green. The two former colours when combined give white; the two latter, purple.

F. G. S.

PHOTOGRAPHIC CLUB FOR BOYS.—Mr. H. J. Cunningham, of Braintree, writes us: "I am starting a small photographic club of working lads. It can easily be understood that the expense of apparatus is a very serious matter. Will you allow me to appeal to such of your readers as may have anything that they do not want, and likely to be of use? We should be very grateful for printing frames, dishes, measuring glasses, or, indeed, anything. I will thankfully acknowledge the receipt of anything that may be sent."

Societies' Meetings.

BIRKENHEAD PHOT. SOC:—At the last ordinary meeting a discussion took place on "Hand Cameras," and Mr. E. M. Tunstall gave his lecture on "A Tour through Normandy," illustrated by views taken by the lecturer.

BRECHIN PHOT. ASSOC:—The above Association gave a public exhibition on the 5th inst. The hall was crowded in every part by a representative and appreciative audience. After a few remarks by the President (Mr. W. Shaw Adamson, of Careston), slides were shown from the Pacific Coast Amateur Photographic Association, Glasgow and West of Scotland Amateur Photographic Association, and Lantern Section of Paisley Photographic Association. The local association was well represented by over 100 slides, chiefly of local scenes and characters. Mr. J. C. Middleton, Curator, worked the lantern, and Mr. R. A. Scott, M.A., Vice-President, described the slides as they were thrown on the screen.

CROYDON CAMERA CLUB.—The first general meeting of this promising Society was held at the Public Hall, Croydon, on Monday, 10th March, Mr. H. Maclean in the chair, and was well attended by a large proportion of the members. The rules as drafted by the *pro tem.* Committee were discussed, and with slight alteration adopted. The election of officers and Council was then proceeded with. On the recommendation of the *pro tem.* Committee, the meeting, after discussion, decided that all the officers, as well as the Council, should consist of *bona fide* working members of the Society, and that no outsiders, however eminent, socially or photographically, should be entitled to take part in the management. Eventually the following gentlemen were elected. President, H. Maclean, F.G.S.; Treasurer, Edgar F. Smither; Hon. Secretary (*pro tem.*) L. De Clercq; Assistant Secretary (*pro tem.*), A. Underhill; Committee, E. F. Blow, W. T. Barker, G. R. White, A. E. Isaacs, W. J. Bishop, and M. Plimmer. During the evening various prints were shown by the members, which indicate that the Society has in its ranks many skilful workers. The next meeting will be on Monday, 24th March, at Public Hall, Croydon, when amongst other attractions will be an exhibition of hand cameras, lantern slides, etc. Gentlemen desiring to join the Club should send in their names to either of the Secretaries or the President, H. Maclean, Birdhurst Road, Croydon.

EAST DULWICH AND PECKHAM PHOT. SOC:—On Friday the 7th inst., Mr. J. W. Edwards presided at the ordinary meeting, when the subject for discussion was "Hand Cameras." A vest camera of Stirn, a small camera by Mr. Stowell, and one of Fallofield's Facile cameras were shown by members. Mr. R. Abrahams also attended and brought with him his now well-known Ideal and Victor cameras, and thoroughly explained the working. The Ideal particularly took the fancy of the members. Mr. Abrahams also showed a new walking-stick stand for hand-cameras, which his firm are just introducing. It is made entirely of metal, and though light is very rigid, has a ball and socket joint at top, and is a very natty and compact stand. The proceedings closed in the usual manner.

GLASGOW PHOT. ASSOC:—The fifth general meeting of the session was held on the 6th inst. in their rooms, 207, Bath Street, Mr. Wm. Lang, junior, F.C.S., President, in the chair. A paper on the "Sizes of Photographic Plates and Papers" was read by Mr. J. Craig Annan, Hon. Secretary. Several photographic novelties were exhibited by Mr. James McGhie. A portrait taken by an automatic apparatus was shown to members. Mr. P. Falconer afterwards gave a communication. A neglected collodion dry-plate process, and transparencies obtained by the method referred to, were shown by means of the Society's lantern.

HOLBORN CAMERA CLUB.—On Friday, March 7th, about thirty members assembled at the club-room. Mr. Chang presented the club with framed prints and lantern-slides from the flash-light exposures made by him at the club exhibition. The slides were then shown on the screen, Mr. Smith kindly officiating at the lantern. Next Friday, "Enlarging from Small Negatives."

LEWES PHOT. SOC:—An ordinary meeting was held on the 4th inst., the President in the chair. Two new members were elected. A vote of condolence with the widow and family of the late Mr. Simeon Norman was passed. The slides sent in to the first quarterly competition were passed through the lantern by the President, assisted by the Vice-President, and the awards of the

Judges were as follows:—Class 1, Landscape, Mr. A. H. Webbing; Class 2, Architecture, Mr. Percy Morris; Class 3, Any other subject, Mr. G. E. Constable. There were fourteen sets sent in from seven competitors, and the work was of very good quality. A special general meeting was to be held on March 18th, to consider the question of carrying out a photographic survey of the district, and a paper on the subject read by the Hon. Secretary. On March 18th the *Photography* prize slides will be exhibited at the National Schools, when members and their friends are specially invited. At the next ordinary meeting, to be held on April 1st, Mr. E. Miller will open the discussion on "Pin-hole Photography."

NORTH LONDON PHOT. SOC.—The annual exhibition of photographs was held on the 4th inst., at Northampton House, St. Paul's Road, Highbury; a conversation was held at the same time. There was a large amount of members' work shown, and also the *AMATEUR PHOTOGRAPHER* "Enlargement" Competition prints, and specimens by Messrs. Morgan and Kidd and the Britannia Company. The President, Mr. Traill Taylor, made a few appropriate remarks, and the vocal and musical portions of the entertainment were then gone through. At the conclusion a number of slides were thrown on to the screen. The next meeting will be held on the 18th inst., at Myddelton Hall, Upper Street; subject, "Printing on Alpha and Bromide Papers."

OXFORD PHOT. SOC.—On the 6th inst. the members assembled to hear a short lecture on "Stripping Films," by the Rev. W. H. Price, and the process of developing and stripping a film was practically demonstrated, the merits of stripping and non-stripping films were also compared, and specimens were exhibited which had been sent by the makers, Messrs. Eastman, the Stereoscopic Company (Carbutt's), and Messrs. Fry. The verdict seemed to be in favour of the stripping-film when compared with the celluloid or non-stripping, on account of an appearance of grain in the latter, but the process of stripping appears to involve so much time and trouble, that the members seemed to be unanimous in deciding to remain true to the old love. A hearty vote of thanks was, however, accorded to the lecturer for his very interesting and instructive description of the process. The flash-light pictures taken at the last meeting did not turn out a brilliant success; some of the negatives were fair, but showed that more light was wanted.

PEOPLE'S PALACE PHOT. CLUB.—At an ordinary meeting held on Friday, the 7th inst., Mr. Beckett, sen., in the chair, Mr. Hawkins gave a demonstration of the "Wet Plate Process." After briefly tracing the history of photography from the time of Daguerre, whose process he also described, he proceeded to make some transparencies, fully describing the *modus operandi* in a very humorous manner. Mr. Downing also brought up an old-fashioned camera which had a peculiar sliding-back arrangement.

PHOTOGRAPHIC SOCIETY OF IRELAND.—A few evenings ago the members of this society had a practical demonstration on "The Working of Lanterns," given them by Mr. Jas. Carson, C.E. He very carefully introduced the subject by showing the utility of the several parts of the lanterns and their accessories. The minuteness with which the demonstrator went into the subject gave much satisfaction, even to some who had "worked lanterns" for some time. Mr. Carson was thanked by the members present, and desired to place the matter on paper to be read at some ordinary meeting of the society. On March 3rd Mr. J. H. Hargrave, C.E., gave a very useful lecture, taking for his subject "Lantern Slides, and How to Make Them." He gave much information as to his experience with plates by several makers, first dividing these plates into two classes, chloride and bromide. The developing he favoured was pyro. He devoted time to demonstrating the mounting of slides, and referred to various masks, speaking highly of Wormald's, which are coloured on one side and white on the obverse side. Dr. J. Alfred Scott added remarks as to intensification, showing a distinct preference for Monkhoven's. He exhibited a printing frame made by himself, for use with quarter-plates in contact lantern exposure. It was so constructed as to admit so much of the lantern plate projecting over any part of the edge of the quarter-plate as might be covered by a mask, when it would be advantageous to include or exclude a part of the subject on the quarter-plate, as the case might be. After other remarks the meeting terminated with a vote of thanks.

READING AM. PHOT. SOC.—The subject of the society's usual monthly meeting held on the 6th inst., at the Science and Art

Schools lecture-room, was a demonstration of Enlarging, the first of a series of demonstrations arranged to be held during the season. A number of 5 by 4 negatives were enlarged upon Ilford 12 by 10 bromide paper by the aid of a lantern lent by Mr. Chas. Stephens, Vice-President, illuminated with the albo-carbon light, and afterwards successfully developed by Mr. Spencer. A very convenient ruby lamp, to burn ordinary carriage candles (Thomas'), was lent by Mr. Wyly. The Secretary, Mr. Phillips, showed and explained the Caldwell instantaneous shutter, fitted to a R. R. lens with iris diaphragm (kindly lent by Mr. Wray), which was much admired; also calling attention to specimens of Greene's opal cards, and several other novelties, specimen publications, etc. Mr. Wheeler brought several prints on Alpha paper, showing the various tones to be obtained by this process. At the annual general meeting held a short time since, Dr. Richardson presiding, a capital balance-sheet was presented, showing a substantial balance in hand. A short report upon the past doings of the society was also read, which showed that there had been held ten monthly meetings and three summer excursions, also that two successful exhibitions had been held in connection with the Science and Art Schools.

SHEFFIELD PHOT. SOC.—The usual monthly meeting was held on the 4th inst., the President, Mr. B. J. Taylor, in the chair. The routine business and election of three new members being completed, the judges' award in lantern competition for the best series of six slides, was announced as follows:—In the opinion of the judges no set of slides were of sufficient merit to take the first prize; the same was, therefore, withheld. The second was awarded to Mr. W. T. Furniss, who also secured the prize for the best slide in the competition. The whole of the slides were afterwards passed through the lantern. Mr. G. Bromley gave an interesting and complete demonstration and lecture on the new benzoline saturator as an adjunct to the optical lantern.

WOLVERHAMPTON AM. PHOT. SOC.—The usual monthly meeting of this Society was held on the 4th inst. Major R. D. D. Hay, Vice-President, occupied the chair. Mr. Barnett, jun., was elected as a member. Mr. G. Austin also was proposed as a member of the Society. Major Hay announced that the second annual meeting of the Society would be held on March 18th. The *Photography* lantern slides were then put through the lantern by Mr. W. B. Mansell, the views being described as they appeared. Slides were also shown by Messrs. J. Stokes and W. Cottrill, etc. Mr. J. Forysth exhibited some fine prints of Scotch scenery, taken during his holidays. Mr. J. Gale also showed two capital enlargements of groups.

YORKSHIRE PHILOSOPHICAL SOC. (PHOTO. SECTION).—The usual monthly meeting was held on the 5th inst. The Hon. Sec. (Mr. H. R. Moiser) exhibited some negatives taken on the new Eastman transparent flexible film, as used in one of their roll-holders. The Hon. Sec. then exhibited about 100 transparencies by the lantern, copies of photographs taken from paintings by the old masters. To the members present these slides were of especial interest, as showing the particular qualities of four commercial brands of plates—Thomas', Mawson's, Fry's, and the Ilford Alpha plates.

—♦♦♦—
 "Lippincott's" for March keeps up its interest, and the story, "Two Soldiers," by Captain Charles King, is well written. "The Elixir of Life" and "A Dead Man's Diary" are continued.

CORRECTION.—The Hon. J. G. P. Vereker writes: "There is a clerical error in my reply to Query 3492, 'Test Papers'; it should read, 'Brazil wood paper turns from red to yellow in hydrofluoric acid,' not 'hydrochloric' as printed."

"HOME PORTRAITURE" NUMBER.—Mr. A. Stieglitz writes from Berlin: "Have received the 'Home Portraiture' number of the *AMATEUR PHOTOGRAPHER* this morning. Please to accept my congratulations for the same, as it is undoubtedly a step forward in the right direction. The reproduction of my 'Meditation' is most excellent. I am greatly pleased with it."

HANDY BAGS FOR CAMERAS, ETC.—Messrs. J. A. Jacobs and Co., of 12, Chapel Street, E.C., have submitted to us for inspection a very capably made bag which will take camera, three dark slides, box of plates, lenses, four-fold tripod, and the other odd things that make up a photographer's kit. These bags are of very handy shape, and when seen we feel sure there will be a large call for them. We do not know if Messrs. Jacobs have yet arranged to put them on the market.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns MUST be received by TUESDAY MORNING'S POST.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3559. **France and Italy.**—Can anyone inform me whether any permit for photographing in France or Italy is required, and whether there is any trouble at the custom houses with plates, etc.?—A. B. PRICE.

3560. **Brighton.**—Is this place good for Instanto work, and what plates for seascapes?—F. J. T.

3561. **Negative Varnish.**—I have been trying to make some negative varnish, but cannot get white shellac to dissolve. Can any reader tell me the reason?—RALEIGH.

3562. **Hand-Camera.**—Can anyone tell me which is the best hand-camera, the Ideal or the Victor? And would they recommend either of these in preference to any other hand-camera at the same price and size?—S. R.

3563. **Lens.**—Will some one kindly inform me whether a Ross' Rectigraph lens is good for groups, views, and architecture, and oblige?—FOREIGNER.

3564. **Mountant.**—I should be glad to know whether ordinary commercial gum has any detrimental effect on bromide prints when used for mounting them. Also whether pure gum arabic mucilage is a suitable mountant for silver prints. If not, will one of your readers give me a receipt for a perfectly harmless mountant that will keep indefinitely, and which can be used without requiring to be heated?—LIMPET.

3565. **Pizzighelli Paper.**—Several acquaintances have told me that this paper requires to be steamed before putting behind negative, and that it often stains the negative permanently. Is there no way of preventing this? If not, I should be afraid to try it.—STAINS.

3566. **Toning, etc.**—(1) Can any reader inform me whether good tones can be produced with the acetate of lead toning and fixing bath; if so, are the prints as permanent as those toned with gold? (2) How is an adapter or second front used?—X.

3567. **Enlarging Lantern.**—I want to get a lantern with which I can make enlargements, and also show lantern slides. Will anyone tell me of a good one for this purpose? I rather incline towards Hughes' Pamphengos enlarging lanterns, but would it be possible to use one of them for ordinary lantern slides as well? The lantern must not cost more than £3 or £7, preferably less, half-plate size.—R. A. R. BENNETT.

3568. **Instantaneous Work.**—Using a half-plate Instantograph and the shutter supplied with it, which of the three kinds of Ilford plates must I use for ordinary instantaneous work? It is necessary to use the special (red label)?—F. G. K.

3569. **Double Dark Slide.**—I am hesitating as to which form of double dark slide to adopt for ordinary out-door work—the solid or the book form—and should, therefore, be glad to ascertain from the experience of others which sort is to be preferred, and also makers' names.—DOUBTFUL.

3570. **Lantern Objectives.**—I am informed that a disc 21 feet in diameter, thrown on a screen by a lantern objective of 6 inch focus, and working at $f/4$ would be as brightly illuminated as a disc of 15 feet diameter when thrown by an objective of 12 inch focus, also working at $f/4$. Will some gentleman with a knowledge of optics and light kindly say if I have been correctly informed?—MAGIC LANTERN.

3571. **Some Points about Lens.**—Can any of your

numerous readers kindly give me some information on the following: (1) Length of focus (what is meant by, and how found). (2) Use of stops. (3) Most possible exposure to give, without moving objects being blurred (with Lancaster's R.R. lens). The majority of text books on the above subjects treat the matter in such scientific language that many beginners like myself are not able to follow.—N. M. H.

3572. **Hand Camera.**—I have a Lancaster quarter plate Instantograph camera, with the usual lens, complete, £2 2s.; will some reader kindly inform me if I could put the camera into a box and use it as a hand or detective camera?—R. N.

3573. **Lantern Slides.**—Is it advisable to varnish lantern-slides before binding them together? Or are they better left untouched? Should like the opinion of those interested in this kind of work.—LIMELIGHT.

3574. **Hand Camera and Lens.**—(1) Will some kind reader recommend a first-rate fixed-focus hand camera? Is the "plate dropping" style to be relied on? Are the plates in perfect register by so changing? (2) Is Taylor's detective lens the best for fixed-focus cameras?—CARLEBAD.

3575. **Hiring Apparatus.**—Will some reader kindly inform me where photographic apparatus can be obtained for which weekly payments are taken, and oblige.—POOR ONE.

QUERIES UNANSWERED.

Jan. 10th.—Nos. 3353, 3356, 3367.

Feb. 7th.—Nos. 3417, 3430, 3435.

14th.—Nos. 3437, 3441, 3452, 3454, 3457.

21st.—Nos. 3471, 3472, 3476, 3478, 3487, 3491, 3493, 3494.

28th.—Nos. 3517, 3518.

Mar. 7th.—Nos. 3528, 3529, 3530, 3531, 3542, 3544, 3551, 3554, 3555, 3556, 3557.

ANSWERS.

3466. **Dallmeyer's Rapid Landscape Lens** is designed for views of distant objects, mountain scenery, etc.; is undoubtedly one of the best obtainable for this special line of work, but it will not take the place of the rapid rectilinear, which is the best all-round lens to possess. Views, buildings, and groups are taken equally well with it. Another feature of this class of lens is that it may be taken apart, and the front or back combination used by itself for views, as a single long-focus lens.—T. S. MAYNE.

3469. **Photographing in Venice.**—No restriction in the streets, on the Canal, or bridges. Concerning interiors, however, you will require to judiciously dispense small gratuities. You must expect some degree of inconvenience with the populace looking on, if you remain too long in one spot with your camera set up. A short-focus wide-angle lens for narrow streets or confined interiors will be requisite. No use anything over the 9 inch for half-plate; but I fancy you will find the 7 inch suit you better.—T. S. MAYNE.

3469. **Place's Shutter.**—Seven and sixpence. I obtained mine from Mr. Wm. Rogers, optician, Cook Street, Liverpool.—T. S. MAYNE.

3477. **Cockling.**—If you do not desire to paste the photographs in, instead of slipping the corners through slits—obtain the small circular gum tickets about size of sixpence, plain white, used by drapers—the gum is very strong—place one at each corner of your picture, a small portion on the corner of the picture, and the larger portion on the page of your book. I have an album of half-plate Ober-netter prints in use for past three years, and find it quite perfect. It has this advantage, at any rate: you can remove a picture without disfigurement, it also preserves the enamel perfectly.—T. S. MAYNE.

3484. **Portable Studio.**—See Cassell's penny weekly, *Work*, No. 50, March 1st; you will find some useful information, sketch, and measurements on pages 796 and 798.—T. S. MAYNE.

3486. **Lens.**—The half-plate will be the best, of course, presuming you are not restricted in space. With quarter-plate, distance from sitter will be about 12 ft., with half-plate about 18 ft.—T. S. MAYNE.

3489. **Flashlight.**—Rather dangerous experimenting with compounds you are not familiar with. Read an exhaustive paper on "Flash Powder Explosions," in *Photographic News*, No. 1644, March 7th. Regarding lamps, see one made by Sands and Hunter; it is not expensive, but is first-rate.—T. S. MAYNE.

3490. **Enamelling.**—My experience with the enamelling plates was like your own. I returned to the plate glass, which, besides giving a much better result, allows you to see when you have perfect contact and no air-bells. Of course, the glass must be perfectly clean and properly prepared, as directed.—T. S. MAYNE.

3495. **Rapid Rectigraph** is a lens of the doublet or rapid rectilinear type. Rapid symmetrical is also another, but practically the same combination, being sold by the different makers under the various titles, but all possessing the same general features—that is, lenses so corrected that they are capable of

giving a fair average focus to objects in different planes. This capacity is called "depth of focus," which differs in the various forms of lenses—the old-fashioned portrait lenses having least of it, the rectilinear the most.—T. S. MAYNE.

3502. **Aptus Hand Camera.**—The Ross 6-in. rapid symmetrical lens is made specially to suit 5 by 4, and nothing but praise can be accorded to it. I have used it for a great variety of subjects.—T. S. MAYNE.

3505. **Astronomical Lantern Slides.**—Call at York and Sons', 87, Lancaster Road, Notting Hill; you will get everything you require in the above or any scientific class.—T. S. MAYNE.

3508. **Developer.**—If you are satisfied with hydro-quinone developer for negatives, Thomas's two-bottle solutions, in neat safe case for travelling, should suit you. For negatives, dilute both to double quantity, that is, for, say, 2 ounces of each, mix four ounces additional water; but for transparencies, full strength.—T. S. MAYNE.

3513. **Hand-Camera.**—If you are in London, go and see the Ideal camera at Abraham's, or visit the Crystal Palace Exhibition and choose for yourself.—E.

3514. **Detective Camera, How to Make.**—Dimensions, etc., too intricate for this column. For answer to part of your inquiry, see 3467, "Oxide's" answer, *AMATEUR PHOTOGRAPHER*, February 28th. I would advise you to have a separate case to sling over shoulder and contain the six dark-slides, so keeping the box-camera in smallest possible bounds. The term "fixed focus" is misleading. Your Optimus is an excellent lens, but neither it nor any other lens ever made will take objects in *exact* focus 10 ft. off and 30 ft. off without moving the position of the lens. Consult an excellent tabular diagram in *Journal*, 1556, February 28th.—T. S. MAYNE.

3521. **Lancaster's Silver Ring Lens.**—Reliable. Yes; no doubt will fit same flange as their other lenses of similar size. From experience I know the landscape and wide-angle series fit same flanges.—T. S. MAYNE.

3524. **Euryscope.**—This is the highest class lens made by Perken and Rayment (and their goods are all reliable); it is of the R.R. type, but working at $f/6$. The regular R.R. series works only at $f/8$. Better hunt up "British Journal," August 12th, 1887; you will find an exhaustive report on Optimus Euryscope therein, by J. Traill Taylor.—T. S. MAYNE.

3526. **Posing.**—Obtain the latest Special, *AMATEUR HOME PORTRAITURE*, just out. You will see in it a reproduction, No. 14, page 14, a very fairly composed group taken out-of-doors with a hedge for background; its title is "An Indian Child's Supporters," taken by a lady amateur, Miss A. Riley, Kendal, a beginner—this will serve you as a model. Another excellently grouped composition on page 18, entitled "Afternoon Tea," No. 22.—T. S. MAYNE.

3527. **Micro-photography.**—In the first place, let me call the attention of the querist to the fact that what he evidently wants is information re photo-micrography, and not micro-photography. It is as well to distinguish between these, as they are totally different processes. With regard to the exposure required, this of course varies considerably with the nature of light employed, colour of subject, objective used, and extension of camera. As a rough guide for exposure, I give one or two extracts from my note-book. (1) Subject, wasp's head; 1 in. objective; extension of camera, 8 ins.; plate, Ilford ordinary; light, $\frac{1}{2}$ in. paraffin lamp; exposure, 4 secs.; colour, light brown; result, good. (2) Subject, gnat's head; $\frac{1}{2}$ in. objective; extension of camera, 6 ins.; plate and light as above; exposure, 20 secs.; colour, brown; result, good. (3) Subject, fly's foot; $\frac{1}{2}$ in. objective; extension of camera, 2 ins.; plate and light as above; exposure, 10 secs.; colour, brown; result, under-exposed; 20 secs. would have been better. It is best to use two condensers, one large one close to light, and a smaller one for focusing image of larger one on the object. I am afraid that I have already trespassed too much on our Editor's space, so if you wish further information, write to me direct.—LENS (address with Editors).

3527. **Micro-photography.**—It is impossible to give a complete answer to "Micro's" query about exposure, as so much depends on the source of light, angular aperture of objectives, and objects to be photographed. The only guide is experience; photograph with an inch objective an object such as proboscis of blowfly, giving, say, a minute's exposure, and from that work till a satisfactory negative is got; then using this as a standard negative, expose other subjects accordingly. I believe, for these purposes of comparison, Warnerke's sensometer tablet has been used, and no doubt, would prove convenient. With daylight and Abbe's condenser, 1 in. (16 $\frac{1}{2}$), Chapman's plate (slow), and magnification 32, I have got a good dense negative of section of pepper in a minute; and, perhaps, the following from Davis' "Practical Microscopy" may be useful:—Distance of plate (Mawson and Swan's 15 times) from object, 24 ins.; lamp, ordinary paraffin bull's-eye, 3 in. focus condenser; 1-in. objective, proboscis of blowfly, 70 secs.; $\frac{1}{2}$ in. glass crystal, 60 secs.; $\frac{1}{4}$ in. section of deal, 7 mins. The ordinary microscopical lamp flames are rather small for this work, and a wide-wick common lamp would be handier. As for blue glass, it would no

doubt reduce the power of the light, and possibly give softer pictures, but, on the other hand, by cutting off the yellow rays, might enable one to focus better for the photographic rays.—J. G. P. VEREKER.

3532. Lantern-Slide Making.—Hepworth's "Book of the Lantern," published by Hazell, Watson, and Viney, Ltd. (publishers of the AMATEUR PHOTOGRAPHER). My experience favours Mawson's plates for transparencies, developed with Thomas' formula, full strength.—T. S. MAYNE.

3533. Over Exposed Plate.—"Raga" should use less of No. 2 if he knows it is over-exposed previously to developing; but if only discovered during the process he should rapidly pick out the plate and wash it, and before proceeding with development either make up a fresh solution containing half the quantity of No. 2, or else add some bromide solution to the developer previously used.—SUCCESS.

3533. Over Exposed Plates.—Try bleaching with mercuric chloride (usual intensification formula), wash thoroughly, then re-develop with your own hydroquinone formula; wash well again.—T. S. MAYNE.

3533. Over-Exposed Plate.—"Raga" might try reducing with hypo and ferridcyanide (see answer to 3545) till the shadows were nearly transparent, then bleach with mercury, and blacken with old hydroquinone developer, repeating bleaching and blackening if necessary.—GREENWOOD.

3533. Over-Exposed Plate.—The best thing is to intensify with the ordinary intensifier.—W. F. JONES.

3534. Eikonogen Developer.—Try Warnerke's—
Sulphite soda... .. 40 parts.
Distilled boiling water ... 100 "
Eikonogen 20 "
Caustic potash 20 "

Use 1 part to 3 of water.—W. F. JONES.

3534. Eikonogen Developer.—"Cleek" could not do better than use an eikonogen developer sold by Mr. Briggs, 21, Cheapside, Lancaster. Eastman films are extremely sensitive, and therefore, "Cleek" had better place a piece of deep ruby glass in front of his lamp during development, and take care that no direct light falls on the film until the process has advanced considerably. The extra ruby glass can then be removed, as the film will now be much less sensitive.—SUCCESS.

3534. Eikonogen Developer.—If "Cleek" is a London resident, no doubt Editor of AMATEUR PHOTOGRAPHER will allow him to read p. 159, October, 1889. American Amateur Photographer, which contains an excellent paper, by F. C. Beach, a high authority, on merits of this developer, for the special purpose "Cleek" requires; it is too long to reproduce in this column. If not a resident in London, send me address, and I will lend you my copy.—T. S. MAYNE (address with Editor).

3534. Eikonogen Developer.—I have used the following, which was given in the AMATEUR PHOTOGRAPHER on January 31st of this year, with good results, and is by Dr. Piffard, of America. The American quart is equal to 32 ozs. English measure.

No. 1.	
Water...	1 quart
Sulphite soda	2 ozs. (avd.)
Eikonogen	1 oz.
Bromide potassium	8 grs.

No. 2.	
Carbonate potash	1 oz.
Water... ..	8 ozs.

Use No. 1, 1 oz.; No. 2, 1 drachm.—CODBECK.

3534. Eikonogen Developer.—I am using Eastman transparent film in a detective camera, and find the best developer to be Jumeaux' single solution eikonogen developer. It is very simple, and I use it according to direction. I place film in dish with developer, cover with a card so as to keep the light from the film, and leave it until sufficient density is obtained. The films must be allowed to get very dense, as they look rather deceptive; in fact, you can hardly get them too dense. The negatives are full of detail, and give splendid bromide prints.—J. A. H.

3534. Eikonogen Developer.—An improved Eikonogen developer, made from an entirely new formula, called Jumeaux single-solution developer, is, in my opinion, the very best in the market for Eastman's celluloid films. It never produces any stains, and can be obtained in powder or solution from W. Briggs, 21, Cheapside, Lancaster. Vide AMATEUR PHOTOGRAPHER, November 29th and December 27th, in the latter p. 430.—F. L. A.

3535. Films, Exposing.—If "R. M.'s" carriers have a rabbit on which the plates (or films) rest, I would suggest his trying a piece of stiff cardboard backing, such as a mount. I find such works admirably with $\frac{7}{8}$ by 5 Carbutt or Fry films. Eastman are, I believe, much more difficult, being thinner.—GREENWOOD.

3535. Films, Exposing.—The best and most satisfactory mode of holding films in an ordinary dark slide is as follows:—Procure some stout cardboard, and cut two pieces, so that they fit firmly inside dark slide, then, when you put films in dark slide, back each with the cardboard, which, by the way, should be blacked, and you will find the films lie perfectly flat. These cards also will answer the pur-

pose as carriers for smaller films, by drawing the required sizes of the smaller films on the card with a pencil equidistant from their (cards) centres, and about $\frac{1}{4}$ in. from each corner of these rectangles, to make a slit at an angle of 45 degrees from the sides, so as to insert corners of films.—H. G. GORDON.

3533. Madeira.—There are at least two professional photographers in Funchal, Madeira, viz., A. Camacho, Praça da Constituição, and another at 21, Rua de S. Francisco. The former allows amateurs to use his dark-room, and I have no doubt would sell them plates and chemicals. I can give "Langside" the address of my brother, who is in the Canary Islands, but who has photographed in Madeira, and I am sure he will give him any information he can as to exposure, etc. He would receive a reply in about a fortnight.—LEON (address with Editors).

3538. Madeira.—One of my neighbours spent several months there; advises taking out your own stock of plates and chemicals. Exposure: provide yourself with shutter, or use $f/32$, with cap, for half-plate; smaller stop if whole-plate.—T. S. MAYNE.

3533. Madeira.—Write to Mr. Reid, Carmo Hotel, Funchal. He has a dark-room and every convenience for amateurs.—TRAVELLER.

3537. Isle of Wight.—A harvest for the camera. Carisbrook, Cowes, Ventnor, Ryde, Shanklin Chine, Blackgang, etc. Good, cheap, and comfortable hotel, Raynor's Temperance Hotel, Ventnor. Go out on Baker's char-a-banc, which calls every day at this hotel, and take your camera. This is what I did.—W. F. JONES.

3538. Additions to Lenses.—The concave lenses are called "concave optics, uncut," and are of about $1\frac{1}{2}$ in. diameter. They can be obtained at most jewellers' and opticians' for about 6d. each. The most useful are Nos. 6, 7, 8, and 9. Probably No. 7 would suit "Photo-phonos," and he must note that the higher the number the more the focus is lengthened. I attached mine to a kind of card pill-box lid large enough to just fit the lens tube. Remove the back lens and insert this close to the diaphragm, then replace back lens. The stops can be used as heretofore. Probably some jeweller in your locality will allow you to try one or two before purchasing, so as to get one to suit your apparatus. Placing one of these concaves behind a view lens has the effect (besides lengthening the focus) of lengthening also the marginal rays more than the central ones, and giving a flat field with great depth of focus.—W. LONDON.

3539. Precipitation of Bromide Paper Developer.—Hot water will dissolve much more of most soluble salts than cold. Hence, if solution be thoroughly saturated when hot, some of the salt must crystallise out as it cools. This is just as it should be, with the solutions of which the ferrous oxalate developer is composed. If there is a precipitate on mixing the iron and the potash, it means that iron is in excess, or that the potash has been poured into the iron, instead of vice versa. Remedy obvious.—GREENWOOD.

3539. Precipitation of Bromide Paper Developer.—Your solutions are quite right. They should be saturated. The latter part of your query is vague.—E.

3539. Precipitation of Bromide Paper Developer.—If I rightly understand your query, you need not trouble about the precipitation of your chemicals. The reason is this: the amount of salt any definite quantity of water will take up depends on the temperature of the water. If you use hot water, and the solutions are then fully saturated, on cooling some of the potash or iron will naturally be deposited at the bottom, because the water will not hold so much when cold as when hot. Unless this deposition happens, you can hardly be sure that your solutions are saturated, which is desirable in the case of this developer. The temperature of the solutions at this time of year should be about 60 degs. F.—F. W. L.

3540. Hand Camera.—Yes, Fallowfield's is well spoken of, but you should also see, at 43, Charterhouse Square, the Photo Supply Association Stores, Swinden and Earp's new patent, medalled by the Photographic Society of Great Britain, which is a very high honour. It holds twenty plates, no double backs, no tin sheaths; price £7 complete.—T. S. MAYNE.

3540. Hand Camera.—You cannot do better than get the "Ideal" detective camera of Abraham, 81, Aldersgate Street. Is more compact than Fallowfield's, better made, and has, moreover, a time and instantaneous shutter. Cost about £5 5s.—W. F. JONES.

3540. Hand Camera.—Can recommend "Colonist" to get the new Kodak from the Eastman Company, 115, Oxford Street, London, W. The size of the pictures is $3\frac{1}{4}$ in. circular, and can carry 100 negatives. It has also one view-finder, three stops, and a self-capping shutter, and costs only £7.—F. L. A.

3541. Bromide Paper.—To vignette bromide prints by gas-light cut an oval aperture in a piece of stiff cardboard, hold the printing frame in left hand, and with right hand gently rotate the card about half an inch in front of the negative.—O. S.

3541. Bromide Paper.—Diffuse gaslight by ground glass or tracing paper. Fasten vignetting mask on outside of printing frame, say 1 in.

or so from glass. Keep frame moving during exposure, which must, of course, be much longer than with naked light.—GREENWOOD.

3541. Bromide Paper.—Try using a card with an opening cut in it of the desired shape, over which is pasted tissue paper. This will diffuse the light. I have found that moving the printing frame to and from the light during the time of exposure will soften the outline very much.—F. W. L.

3543. Lens for Hand Camera.—See 3514. Fixed focus is misleading. You must have an arrangement to move the lens according to distance you desire to be to obtain your pictures, except you fix your lens at zero, and take nothing nearer, say, than 40 or 50 feet, as the case may be. The Instantograph series is not quick enough for rapidly moving objects, it is only a single-view lens. H. J. Nichols, Williamson Street, Liverpool, has a series of very good French lenses, R.R. type, called the "Eureka." I have several friends using the same in hand-cameras, price is very moderate.—T. S. MAYNE.

3543. Lens for Hand Camera.—The one you propose would be very slow, and only suitable for bright weather. If you could afford about £2, I should advise your consulting Chambers, Featherstone Buildings, Holborn, W.C.—E.

3543. Lens for Hand Camera.—Get a Taylor lens—W. F. JONES.

3543. Lens for Hand Camera.—After perusing several catalogues, the "Almanack," and other advertisements, I decided on Lancaster's Instantograph lens for a hand-camera as suiting both purse and camera. I have tried it, and find that answers admirably; in fact, I would not change hand-camera now for some advertised at £7.—J. A. H.

3543. Lens for Hand Camera.—In reply to "One in a Fix," as he would probably wish to enlarge his negatives, he ought to get the best lens he can afford, and, as hand-camera work is bound to be rapid, one working with as large an aperture as possible. These conditions will only be got in the rectilinear forms of lenses, as portrait lenses do not give good marginal definition; so if he cannot afford a lens specially made for this work he had better get one of the cheaper rectilinear made, which he can get (about $\frac{5}{8}$ in. focus) from 22s. 6d. upwards. It is true a single lens working at $f/11$ can be got for about 12s., but when one goes to the trouble of making a camera it is better to get a more satisfactory lens. For the lenses I refer to dealers' catalogues. A lens working at $f/10$ has a circle of confusion of less than $\frac{1}{16}$ in. at about 35 ft., if focus is $\frac{5}{8}$ ins., and so might be used for ordinary work. The nearest distance, according to the sharpness "One in a Fix" wants, can be easily found by experiment. In getting a lens I should strongly recommend one of the good makers' lenses, as defects are very soon seen in this sort of work, and the plates saved will pay for the lens.—J. G. P. VEREKER.

3545. Reducing.—Hypo, 2 ozs. to the pint of water, with a few drops of a saturated solution of ferridcyanide of potassium, is an excellent reducer. Won't keep.—GREENWOOD.

3546. Angle of Lens.—Mr. Feilden must have used the word "large" in some other sense than diameter. If he means the larger the diameter the larger the angle, it is certainly not true. The reverse is nearer the mark.—GREENWOOD.

3546. Angle of Lens.—Cannot agree with Mr. Feilden about this.—W. F. JONES.

3547. International Camera.—This is good in every way, and can be thoroughly recommended. Should, however, prefer a Wray or Taylor lens.—W. F. JONES.

3543. Stereo Slides.—Glass transparencies are on plates, lantern emulsion, specially made in standard stereo size. Mawson and Swan's I like best, 2s. 2d. per dozen. Develop with Thomas' hydroquinone formula, full strength. Any dealer will obtain them for you, as Mawson's have a London house. Ground-glass must be very fine; the best I obtained in Paris, but lately I have used Chadwick's (Manchester) ground-glass substitute; it is very much cheaper, and quite equal to ground-glass.—T. S. MAYNE.

3549. Stereo Slide.—If S. Stamp prefers a complete slide of "Rosset Mill," referred to, he can have it with pleasure, without cost. Write me, care of Editor.—T. S. MAYNE.

3550. Definition Wanted.—This means that the solution of gelatine must have some sulphate of baryta or kaolin mixed with it, and the latter, being insoluble, will remain as a kind of precipitate. To prepare the mixture, proceed as follows: Make a solution of gelatine, and while still liquid add some sulphate of baryta or powdered kaolin, and mix up well.—F. L. A.

3552. Bromide Enlargements.—Eikonogen is capital for this work, is just about as good as iron. Vide formula 3534. Warnerke. Dilute with twice quantity of water for bromide. Prefer quinol. pyro for this work.—W. F. JONES.

3552. Bromide Enlargements.—The following eikonogen developer works well on bromide paper—

A.	
Eikonogen	60 grs.
Sulphite soda	120 "
Water	4 ozs.

B.			
Carbonate potash ...	...	240	grs.
Water ...	...	1½	oz.
Take of A ...	...	5	drms.
Water ...	...	3	
B ...	...	20	minims.

More water may be used. Local application of potash with a brush has a great effect in bringing up parts that are lagging behind. One lot of developer will do several prints.—GREENWOOD.

3553. **Norfolk Broads.**—There is a small pamphlet book entitled "The Log of the *Salage*," with illustrations from photographs, reprinted from "Tinsley's Magazine" for August and September, 1889, by the Hansard Publishing Union, Limited, London and Redhill, which will give the information you require, besides being a very interesting account of a cruise on the broads. I think you would obtain this book gratis from the Great Eastern Railway Company by applying to them, as they issue it gratis with their time tables.—H. G. GORDON.

3553. **Norfolk Broads.**—Consult an article in the *AMATEUR PHOTOGRAPHER* for September 16th, 1887. Yacht will cost 50s. to 100s. per week, according to tonnage, season, and accommodation. The following are a few of the books published:—"Three Weeks in Norfolk," by Clarke, 1s.; "Notes on Rivers and Broads of Norfolk and Suffolk," by Brittain, 1s.; "A Month on the Norfolk Broads," by Rye, 1s. 6d.; "Handbook to the Rivers and Broads of Norfolk and Suffolk," by G. C. Davies, price 1s. 6d., and a fuller edition of the same at 7s. 6d.—E.

3553. **Norfolk Broads.**—The best popular guide is the "Handbook to the Rivers and Broads of Norfolk" (which has an excellent chart) by Mr. Christopher Davis, who is a successful amateur photographer. It is published by Jarrold & Sons, Paternoster Buildings, E.C.—A. MOORE.

3558. **Stereoscopic Effect.**—I do not see how this effect is to be obtained by any other means than by presenting two separate and dissimilar pictures (taken from slightly different points of view, that is to say), one to each eye, at the same time, so as to simulate what happens naturally when looking at any object. I do not think it will do for each eye to see both images in the manner you suggest.—F. W. L.

3558. **Stereoscopic Effect.**—To obtain the true stereoscopic effect you must have two pictures—to a certain extent unlike, mounted on one card, or printed as a transparency on one plate—this, when viewed with short-focussed lenses somewhat similar, and the lenses used producing the pictures (when looked at, of course, with both eyes), the brain combines them, and our sense of sight receives a single impression, the true stereoscopic effect. Try for yourself what you propose, and you will only get a result like a double image produced by a sifter moving, or your paper, when printing, moving out of register.—T. S. MAYNE.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED: AM: PROT:

H. J. L. CUNNINGTON.—We will try and look you up a few things, and insert a par.

C. D. D.—Have written the reverend gentleman, asking him to contribute an article.

AMMONIA.—We will forward your note to Capt. Bruno.

FRONIS.—No name and address; and we are not makers of photographic apparatus.

TWO FOXES.—Many of the dealers stock it, we think, but you would do well to procure it direct.

ALEX. KIRBY.—We will insert your letter, and will write you about rules, etc.

H. J. L. GRESHAM.—The camera B is one of, if not the best in the market, and is well worth the extra money. Item 2 we do not recommend; the one you name has a good reputation. Item 3, have never tried, so cannot say. Item 4: If you send the bromide prints and leave them for a day or so, will report upon them with pleasure. Until we have something worth reproducing. Should like to if it were not for the expense. We don't like to pass an opinion upon "rough prints," still you seem to have "got" the animals very fairly.

ERNEST H. CARTWRIGHT.—We publish your letter.

H. F. LINGING.—Being returned, we quite lost touch of your prints; send them to us, and we will be pleased to report upon them.

J. HARRIMAN.—Very sorry, evidently "Cassius" has got mixed.

REV. W. BENNETT, B.A.—Letter received; and we regret we find the word *except* was used. Sub-

scribers not having seen, or being likely to see, the prints you contributed to the "Home Portraiture Competition," cannot, of course, form any opinion as to the justness of the Editor's criticism. But if it will be any satisfaction to you we are quite willing that the prints should be submitted to Mr. H. F. Robinson, or either of the other judges. Your concluding paragraph is unjustifiable, the prints were at your call at any time.

HERBERT R. SPENCER.—The eyes of a "naturalistic" photographer would be even too penetrating. So pleased to receive your congratulations.

PERCY E. LYNE.—Reversal of the image not to be depended upon.

M. J. S.—Never heard of the lens; impossible to say what it is worth.

X. Y. Z.—We do not advise by post. The camera is very well made at the price. We should advise No. 2, but first-class lenses are supplied by the maker of the camera.

W. CRAMPTON.—We are very much obliged to you, and will try and get Messrs. Smith and Sons to have the *AMATEUR PHOTOGRAPHER* on sale at Brighton on Thursday afternoon. Our publishers make a very large delivery to them quite early Thursday morning.

REV. CANON MANN.—Many thanks for your letter.

K. O.—You will be quite safe with either of the following lenses: A, C, D, or E. They are all of excellent quality, and will give you much satisfaction. We are glad to find that our "Competition" prints have acted as a stimulus to persevere.

B. H. ABBATT.—Very pleased that the portrait prepared for the *REPORTER* of the President of the Bolton Photographic Society meets with approval.

C. S. COBE.—Thanks; MS. to hand. It will be very useful.

W. FREW.—Your MS. for *REPORTER* to hand. We will quote you for reprints by an early post.

A. F. W. F.—Before committing ourselves to an opinion, we should prefer to have an opportunity of examining the slides, and to have the formulae of developers used.

REV. T. PERKINS.—We are much pleased with your slides. They are good in tone, clear, and bright. The point of view in every instance admirably selected.

ORDNANCE.—The two portraits you send us are most encouraging. In A your model is a little stiff, and the hands rather too obtrusive. It is well, if possible, to get them on the same plane as the face. The features are slightly blurred, and the hair not clear and bright as it should be. In B there is some fault about the hands, but in less degree is the blur noticeable in the features. You have quite as much definition as you might expect from a cheap French lens, working at $f/8$, but it might be advisable to use a smaller stop, and slightly prolong the exposure. In A your model is standing rather too close to the background, and the picture would be improved by her standing free of the pedestal instead of leaning upon it. Considering the very short time you have been at work, the pictures show that you are a careful worker, and that by further study you will be very shortly doing capital work.

C. EMMANUEL.—Could you give us a call. We might then talk over your ideas.

A. H. WEBLING.—We will try and return your slides on Monday or Tuesday at the latest.

F. H. B.—We have safely received your negative. The lens does not seem to have covered the plate. The "poorness" of your negative is due to underdevelopment.

V. SNOW.—Your work is very creditable for a beginner. We think you might have got a better print from your negatives. Why not use the developer that is recommended by the maker of the plates you are working with? You do not give any particulars of exposure, lighting, etc. We shall be pleased to see some of your work at the end of the season, as we are sure you will soon improve.

W. BUDD.—We cannot spare time to answer by post. The firm you write about are genuine people, but not prompt. We do not hold a very high opinion of their hand-camera, but then it is sold at a very low figure. We have seen most excellent work done with the half-plate set you mention, and it is very often used for pictures sent to the *AMATEUR PHOTOGRAPHER* Competitions.

POLAPT TAMAR.—D first, then A. The latter is the better, but is complicated, and we do not know if it is actually in the market; D is a tried instrument. This answers 1 and 2. We do not care for B, and that it is advertised to work at $f/11$. We should prefer $f/8$, and about 5-in. focus; so much for 3 and 4. In answer to question 5, we should recommend C or B; the former for preference. There is certainly trouble with the plates in A. At present the cheapest and best is D.

N. WINGFIELD.—You will have a most useful and serviceable instrument in E. If you prefer a hand camera with dark slides, we strongly recommend F, it is admirably made, and has many novel and useful points. With camera E certainly lens E. With camera F, lens A—B and D are both good lenses, but those already referred to, are made and supplied by the makers of the camera, and are thoroughly tested for the work they have to do.

C. P. S.—We shall be pleased to have a "Letter to the Editor" column in the *PHOTOGRAPHIC SOCIETIES REPORTER*, and also such a column as this.

G. F.—From the list you send we would advise E or D, both should be seen before purchasing.

HON. T. G. P. VEREKER.—Very many thanks for letter and answers.

F. TAYLOR.—Any of the four cameras you name are thoroughly serviceable hand cameras. A is the cheapest and most convenient. B is well made and serviceable. C. We have not sufficient knowledge of to advise you to purchase. D is unique in form, and may be used either with roll-holder, changing-box, or dark-slides, it has advantages, and if you fancy its form you will be sure to have a useful instrument. We shall be very pleased for you to have the apparatus sent to us, and have no doubt any advertiser in the Sale and Exchange Column will be pleased to offer for sale subject to our report, our charge for *REPORT* will be at the rate of 2½ per cent. upon the selling price. The charge to be paid by the buyer.

MICHAEL A. SCOTT.—If you address the firm of plate-makers you mention, Watford, Herts, your letter will reach them. We will add your name to our list. It is most encouraging to find that our weekly, monthly, and quarterly are so useful to you. It is our practice to visit Scotland in July every year for a short stay, and if we reach as far north, shall be delighted to accept your invitation.

S. E. KENT.—Lens 1 and shutter 6 would meet your requirements, we think. It is always rather dangerous to adopt an article or apparatus that has been patented, although it may be only a revival of a previous unpatented invention. We do not recommend MS., the back of camera would have to be altered.

E. F. C.—There would be no vibration with the shutter until after exposure. We should advise you to consult the makers of the camera, and feel quite sure that they will advise you as to the shutter best suited for the special camera you have of theirs, which, by the by, is a very beautiful instrument.

CARILDA.—We cannot advise you of any book upon the production of what are called photo-blocks. A series of lectures were delivered sometime since before the members of the Society of Arts. The plant required is costly, and the work is one of great responsibility. Our printers, Messrs. Hazell, Watson and Viney, have for years cast their own type, but hesitate to undertake the responsibility of making type-blocks. We are sure that you will find it best to employ one of the firms who make the business a speciality, and we will give you names and addresses on receipt of stamped envelope. Very pleased to hear that our journal is highly appreciated, and hope you will soon be able to establish a society in your town.

REV. E. S. PAGE.—We should advise the book form. The special slide you mention is very light, but it certainly has the fault you mention; but in practice we do not think it a serious drawback. We know of no one making the "blackened square of tin with a spring attached," but in the book form and most dark slides there is such a dividing plate. We have slides of the pattern you name, and they have no appliance for keeping the plate in register. We, therefore, insert your query.

A. M. F.—About hand cameras, we do not feel justified in recommending A. B is a really reliable instrument, but a little clumsy for a lady's use. We should advise you to have either D or E, preferably the former, a very handy compact camera. Very sorry we cannot write you, but if you decide upon the D form, please write us, and we will advise you as to lens, etc. The entry form for "Ladies' Competition" will be sent out in a few days.

GINX BABY.—You will find A and D either of them answer your purpose. A is the least obtrusive, and is very light and handy. You had better have a short focus lens, about 5 inches, working at $f/8$. Write us if you want further help.

T. E. HEATH.—Many of the No. 5 are very good lenses, and give clear definition, working at $f/8$, but No. 6 is a very much better instrument, and will work at $f/8$. Of the cheaper lenses we would advise 3; but have had no experience of Nos. 1 and 2.

CAFE NOIR.—Your 8 by 5 lens; of course, without seeing the lens it is difficult to say whether the "slight scratch" is likely to affect the "working capabilities" of it. (2) The lenses made by the firm are equal to any in the market. (3) Perhaps not superior to the last you mention, but certainly better than the first.

EURERO.—We cannot advise any one to experiment with the "toy magic lantern lamp."

R. E.—Oh yes! We shall be "at home," and delighted to see you; hope you will all make yourself at home. Yes, we can perhaps find room for a little assistance here; several ideas floating about which you might give a hand with.

W. A. EVERINGTON.—Will write you in a day or two. Cannot reply satisfactorily in this column.

M. TUFNELL.—We think No. 1 or No. 2 will suit you best, the latter is very compact, and most fitted for a ladies' work. We do not know much about the lenses usually sent out, but there are several very excellent short focus lenses specially made for hand camera work. No. 5 is a very handy camera, and can be fitted with a changing box, but

both the other cameras have a stock of plates which are quickly and easily brought into position for exposure.

B. R. W. J.—If you will send us the negative, we will take every care of it, and, if an enlargement can be made, will undertake to get it done for you. It is, we think, very probable that a good picture might be secured, only taking the central figure. Without the negative nothing could be done. We retain the print waiting your reply.

BACKGROUND.—A neutral tint.

ALUM.—Make a fresh bath, it's cheap enough.

GEO. COMMONS.—If you advertise in Sale and Exchange columns, you will have a dozen first-class second-hand half-plate cameras offered for sale. See our note at head of this column.

F. W. LEVETT.—Only too pleased that our friends are kind enough to make suggestions.

TROTT.—The four prints you send show that you are working in the right direction. No. 1 is extremely pretty; rather too much foreground, and as a consequence not sufficient sky; might have been printed a little deeper. No. 2: Very fair, and free from distortion. No. 3: You should have backed your plate, and chosen a time when the sun was not in the chancel window. No. 4 is not a successful landscape; foliage is too heavy. Prints are returned, and letter inserted.

J. W. ELMORE.—Your photographs are very poor, and are not nearly up to the standard of prints sent to our "Monthly Competitions." No. 1: Dreadfully distorted, over-exposed, and badly printed. No. 2: The same remarks apply. No. 3: Really very bad; man's head is a blur, and so is the horses. No. 4 is no better than the others. We don't like to be unkind, but really you have everything to learn, and had better at once buy Burton's "Modern Dry-Plate Photography" and study it. We cannot give you a lesson in this column, nor can we endorse the opinion of "an artist, what always go to Germany every summer, that told me I should be a clever photographer." Not yet, we are afraid; but study the subject, and send us some of your work in six months.

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or two counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the AMATEUR PHOTOGRAPHER will be pleased to report, to any intending purchaser, upon apparatus, etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the SELLER to him to the offices of the AMATEUR PHOTOGRAPHER, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending BUYER to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the SELLER. As far as possible the Editor will undertake to send a report within TWO DAYS of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the Trade Scale, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Accessory.—Balustrade and pedestal, handsome accessory; 25s.; photograph, 2 stamps. Cyclist, 2, Peters Street, Dereham Road, Norwich.

"Amateur Photographer," from April, 1888, up to date; will exchange for anything useful.—Bass, 65, Crocus Street, Nottingham.

Apparatus.—Exchange: quarter Instantograph, complete with lens, shutter, dark-slide, and case, Universal tripod, velvet focussing cloth, Decoudun's photometer, also model horizontal engine parts, for Fallowfield's Facile camera; no approval.—W. Ball, 18, Chaucer Road, Forest Gate.

Half-plate mahogany camera, three double book slides, Chapman's two carriers, best French rapid rectilinear lens, stops, canvas case, Acme pneumatic shutter, four printing frames, view finder, negative washing trough, three ebonite dishes, all good condition, and one Leerebours and Secretan second-hand portrait lens; the lot cost over 220s.; take 130s.; bargain; approval; deposit.—Manoukian, 7, Brazen-nose Street, Manchester.

For sale, 10 by 3 McKellen's camera, with turntable, tripod, three double slides, and Eastman's roll-

holder, with waterproof cases and Dallmeyer's R.R. lens, Watson's half-plate C. camera, three double slides, black travelling case, and cyclists' tripod, in case, fitted with Suter's 38 lens, Turnbull's detective camera, and six double slides; what offers? All the above very little used.—Apply, T. G. H., 8, Upper Hanover Street, Sheffield.

For sale, 7½ by 5 Watson's camera, horizontal and rising fronts, splendid condition, Dallmeyer's single lens (very good one), tripod, and two double dark-slides; take 7 guineas. Also quarter-plate Instantograph, with lens, shutter, tripod, four double dark-slides, and case; £2. Also a splendid Optimus R.R. lens, 5 by 4, with stops; cost 31s.; take 25s.; a bargain.—Address, T. L., 11, Eton Villas, Crown Hill, Harlesden, N.W.

Burnisher.—Marion's 3 roller, hot and cold, burnishing machine, just done up, as new, by maker; cost £6; offers wanted; approval.—Logan, St. Oswald's House, Tenby.

Burnisher, Lamps, etc.—Cabinet burnisher, two ruby lamps, instantaneous shutter, changing bag, good condition; 14s. lot.—Charcoal Works, Hodson Street, Liverpool.

Cameras.—Quarter-plate Watson camera, four double backs, changing box for 12 plates or 100 films, with case holding camera and slides, in good condition; cost £10; will take £7.—Lees, 19, Corporation Street, Manchester.

Stirn's detective camera, large size, perfect condition; 20s.; seen after 7 o'clock.—Roekaerts, 115, Shirland Road, West Kilburn. Busses pass the door. Krugener's book camera, complete, with 21 sheaths, in perfect order; £2.—Gordon, 16, Weighton Road, Anerley, S.E.

Half-plate Lancaster's Instantograph, with four double dark-slides, carriers, stand, etc., complete, in mahogany case; £3 10s.—A. Matthews, The Spa, Gloucester.

Kodak detective camera, equal new, cost 105s., price 75s.; also full developing set for same, cost 42s., price 21s., or exchange the lot for half plate Ross' Universal lens.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Lancaster's quarter-plate Merveilleux, complete; 10s.; suit beginner.—A. Spiller, Hillside, Hampstead Hill Gardens, N.W.

Good half-plate camera, long extension, all movements (by Smith, Birmingham), three double slides, with carriers, Lancaster's Instantograph lens, Iris diaphragms, patent shutter, extra-firm sliding tripod, also seven astronomical working slides, fifteen comic and slipping slides, coloured; 90s. lot.—Hy. Thompson, Grosvenor Terrace, Harrogate.

Mahogany camera, 4 by 5, dark-slide, and quarter carrier, perfect condition, 12s.; landscape lens and tripod stand, 10s.; approval.—F. Hyland, Willesborough, Ashford, Kent.

8 by 5 Scovill Co.'s American landscape camera, swing-back, etc., three double dark-slides, good solid leather case, and portable tripod stand; cost £8; will sell the lot for £4.—Camera, Tontine House, Cross, Glasgow.

Camera, etc.—5 by 4 London-made long-focus camera, rack adjustment, reversing back, three double slides, Aptsu finder, in velvet-lined waterproof case, £3 3s.; Optimus three-fold ash tripod, adjustable, in waterproof case, 15s.—H. S., 75, Loam-pit Vale, Lewisham, S.E.

Marion's 12 by 10 mahogany camera and slide, Dallmeyer's group and portrait lens to fit the above, equal to new, price £20; one fancy and one plain background, 25s.; superior rolling press, £3 15s.; large print washer, studio chair and stand, large outside show case.—Particulars of Wise, Howard Villa, Howard Street, Reading.

Camera, Slides, etc.—Whole-plate camera, all movements, with wide-angle adjustment, six double metal slides; price £5; new last December.—Apply, Bucknall, Franche, Kidderminster.

Camera Case.—Camera case, leather, cheap, carry nine articles.—Adams, Hermitage Mews, Stamford Hill, N.

Hand Cameras.—Shew's Eclipse quarter-plate hand-camera, fixed focus, four double backs, waterproof case; cost 125s.; price 90s.—Greenwood, Stonegate, York.

Facile hand-camera, new; £2 18s. 6d.—F. A. Bean, Snaith, Yorkshire.

Harmonium.—Large harmonium, 8 stops, walnut case, good condition; £5, or exchange good R.R. lens.—Benson, Marlboro' Road, Oxford.

Lenses.—Beck's 8 by 5 Autograph rapid rectilinear, Iris diaphragms, 70s.; Optimus 5 by 4 R.R., covers half-plate, 24s. 6d.—Summers, jun., 28, Cheapside, London.

Two half-plate lenses (Marion's), portrait and landscape; bargain, 15s., or offers.—Newell, Major Street, Todmorden.

Reynolds and Branson's half-plate R.R., new; approval.—C. Naylor, Batley.

London Stereoscopic Company's £8 8s. half-plate portrait lens, new; £5.—B., 8, Kimberley Road, Stockwell, London.

Lancaster's quarter-plate Rectigraph, Iris diaphragms, in perfect condition, 27s.; wide-angle Rectigraph, same condition, 14s.; lot of sundries,

list, stamp, approval, deposit.—Ridd, Schools, Bishopstow, Barnstable.

Optimus Buryscope, 7 by 5, good as new; 70s.—Hodgson, First Avenue, Sherwood Rise, Nottingham.

5 by 4 Optimus rapid rectilinear lens, excellent condition; 25s.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Ross' 9 by 7 rapid symmetrical, with Newman's shutter; £6 10s.; approval; deposit.—G. Fell, 3, Tressilian Crescent, St. John's Wood, London.

Lens and Slide.—Optimus 6½ by 4½ ordinary portrait lens, condition as new, 33s. 6d.; whole-plate new mahogany slide, 10 by 7½ by 1½, 10s.—G. Adams, 121, Catherine Street, Doncaster.

Negatives.—Stonehenge negatives, whole-plate and half, also cloud negatives.—Apply, Stonehenge, Amesbury, Wilts.

Pathological Slides, by Cole, for microscope; exchange for others, general subjects.—Becher, 15, Jermyn Street.

Photographic Apparatus.—Rouch's half-plate reversible screen, three double backs, two quarter-plate carriers, Ross' 8 by 5 R.S. lens, shutter, tripod, and leather case, Rouch's portrait lens to fit above camera, complete; £15 cash; seen by appointment.—AMATEUR PHOTOGRAPHER Office, 1, Creed Lane, Ludgate Hill, E.C.

Two Instantograph cameras, complete, as issued, lens, slide, stand, etc., quarter-plate, 33s.; half-plate, 66s.; good as new. Wanted, good all-round lens, tripod, slides, accessories, all whole-plate, also good lantern, for either above sets.—Bartlett, Colporteur, Stratford-on-Avon.

Photographic Publications.—Vols. ix. and x. AMATEUR PHOTOGRAPHER, 5s. 6d.; vol. i. "Photography," 5s.; also vol. i. PHOT. SOC. REPORTER, 5s.; all unbound.—A. J. Hockham, 81, Stanstead Road, Forest Hill, S.E.

"Phot. Soc. Reporter," first six numbers; what offers in cash or photographic goods?—John Adams, Skelwith Bridge, Ambleside.

"PHOT. SOC. REPORTER," numbers 1 to 12; what offers?—H. White, Pembroke Dock.

Piccolo.—Improved patent D piccolo; exchange for dark-room requisites for quarter-plate, or sell, 7s.—Bishop, Restaurant, Brynmawr.

Print Washer.—Jefferies' print washer, half-plate size; price 7s. 6d.—Paterson, Victoria Crescent, Bursley.

Roll-Holder.—Will exchange new half-plate Eastman roll holder, loaded with new film, for Facile or whole-plate camera.—W. Smedley, Ashbourne.

Sets.—For sale, half-plate camera, Instanto (by Underwood), two double backs, extra sliding front, two extra carriers, tripod, Optimus 7 by 5 Buryscope lens, lot in case; cost £9; will take £6; all quite new.—Samuel E. Walford, Rose Cottage, Stechford, Birmingham.

5 by 4 square mahogany camera, with leather bellows body, lens by Scovill, New York, folding tripod, one double slide; 25s., or exchange to value. Approval, deposit.—Henry Ridley, 14, St. Thomas's Road, Hastings.

7½ square mahogany-bodied camera, single back, good condition, stereoscopic camera, two single backs, good half-plate lens, printing frames; lot 25s.—Thos' Pinlott, Whitley Road, Macclesfield.

Lancaster's quarter-plate camera, 1885 pattern, with lens, double dark-slide, and tripod top; price 15s.—Mander, 5, Fenwick Street, Liverpool.

5 by 4 camera back, excellent rapid lens (Stanley, London), printing frames, chemicals, stand, trays; 40s.—E. Bass, Forest View, Walthamstow.

Half-plate McKellen's treble patent camera, two slides, three-fold tripod, price £7 10s.; 3B Suter lens, £2 15s.; kodak, with 60 exposures, half-price.—6, Montford Place, Kennington Green.

Good half-plate set, Facile hand-camera, Ross' 8½ by 6½ A.O. doublet, Wratten and Wainwright's portable dark-tent, and tripod stand.—Ridgway, 1, Sparrow Corner, Minories, E.

A quarter-plate camera, brass-bound, double swing, rising and falling front, double extension, four double slides, one brass-bound, a 5 by 4 Optimus rapid rectilinear, a mahogany folding stand, view finder; £3 10s. the lot.—C. Pattinson, 178, Regent Street, W.

Lancaster's Instantograph camera, 1890, fitted with rapid rectilinear lens, complete set, and guaranteed in very fine order; £3 15s.; all improvements; approval and exchange.—C. Carlos, 74, Hercules Buildings, Westminster Bridge Road.

Complete quarter-plate kit, by Watson, for sale.—Clements, 3, Prospect Road, Old Brompton, Chatham.

Shutters.—Kershaw shutter, 3 in. diameter, quite new; £1.—R. Stamp, 13, Stanley Road, Barrow-in-Furness.

Shutter, Lens, etc.—10 by 8 Optimus rapid Buryscope, Kershaw shutter, £9 12s.; 7 by 5 Optimus R.R., 35s.; approval; deposit.—Webster, 91, Layerthorpe, York.

WANTED.

Cameras.—Quarter Eureka detective, with late improvements, cheap.—C. Emanuel, 36, Finsbury Circus, London.

Detective camera wanted, not larger than quarter-plate. State lowest cash price, with name of maker and full particulars.—H. B., care of Bolian, 21, Featherstone Street, E.C.

A 5 by 4 camera (Optimus or Watson's light pattern preferred); state lowest price and particulars. — F. W. Sears, 22, Chetwynd Road, Dartmouth Park, London, N.W.

Square camera, half-plate (Lancaster's International preferred), wanted, in exchange for half-plate Instantograph, quite new; a little money added for a good article. — D. Ritchie, 7, Frederick Street, Edinburgh.

Camera, etc. — McKellen's 10 by 8 camera, with dark-slides, tripod, etc., complete, with or without lens, must be in condition equal to new, and have all the latest improvements; state lowest price and all particulars; approval required. — O. Clifton, Mile End, Stockport.

Camera, Lens, etc. — Fixed focus detective lens and shutter, or good detective camera. — Maker and lowest price to T. Blake, 77, Anerley Road, Anerley.

Dark-Slides. — Two Talbot's quarter dark-slides,

also ruby lamp. — Thornton, The Pavement, Beckenham.

Dark-Slides and Lens. — Dark-slides, one or two whole-plate, perfect or slightly damaged; also whole-plate lens. State particulars and terms. — Fleming, 176, Stirling Road, Glasgow.

Lenses. — Whole-plate or 8 by 10 rapid rectilinear lens, also pair rapid stereo lenses, must be in faultless condition. — Particulars to A. S., office of this journal.

A.W.A. lens, whole-plate, Ross or Dallmeyer; also print washer. — Harry Molyneux, Haines' Hill, Twyford, Berks.

12 in. focus lens, single or R.R. — Wignall, Highgate, N.

Photographer, opening a branch studio, wants all accessories for same, including a Ross' No. 3 rapid cabinet or Dallmeyer's No. 3B lens, in perfect condi-

tion. — State all particulars and lowest cash prices to Thompson, Photographer, O'neagh, Ireland.

Monckhoven's "Optis." — State price and condition to Ord, 125, Scotswood Road, Newcastle-on-Tyne.

Roll-Holder. — Quarter-plate Eastman roll-holder, good condition. — E. Straker, Kenley, Surrey.

Roller Slide. — Quarter-plate Eastman roller slide. — Wills, 21, Wordsworth Street, Cardiff.

Shutter, Slides, etc. — Shutter, time and instantaneous, for Optimus 7 by 5 R.R., Thornton-Pickard preferred; also two or three half-plate dark-slides for Lancaster's 1889 Instantograph; also half-plate tripod. — C. Naylor, Batley.

Sets. — Cheap quarter-plate camera, lens, and tripod. — Herbert Cunningham, Braintree.

Half-plate or 5 by 4 set, Hure's or Watson's, light patterns only; state particulars. — O. Nowell Ustick, Trenarren, St. Austell, Cornwall. No postcards.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second "	Silver Medal.
Third "	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Seascape — Landscape with Figure — Genre or Figure Study.

CONDITIONS.

1. Not less than six or more than twelve prints are to be entered for competition.
2. All prints must be mounted, and the title (only) must be legibly written on the front of the mount.
3. The work must be entirely the work of a lady, who must be a *bona fide*

amateur photographer, and must have done all the work, *except* mounting, herself.

4. The negative of the prize photographs must be at the service of the proprietors of the *AMATEUR PHOTOGRAPHER*.
5. Photographs can be printed by any process, but *must not* be printed on opal, or mounted in optical contact on glass.
6. All photographs must be sent in on or before the 31st of May.
7. No prints will be eligible that have been entered for any previous competition.
8. Entry forms will be forwarded on receipt of stamped addressed envelope.

NOTE. — The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photographs at a *Conversazione* to be held in the offices, 1, CREED LANE, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

"AMATEUR PHOTOGRAPHER" MONTHLY PHOTOGRAPHIC COMPETITIONS.

THE PROPRIETORS of the *AMATEUR PHOTOGRAPHER* will offer, Monthly, two prizes, consisting of a

SILVER AND A BRONZE MEDAL (WITH RIBBON AND CLASP),

for the best and second-best photographs sent in to each of their Monthly Competitions. The subject of the Competitions will be as follows: —

LANDSCAPE OR SEASCAPE	June 14.
LANDSCAPE WITH FIGURE	Mar. 14 ... July 14.
GENRE OR FIGURE STUDY	April 14 ... Aug. 14.
INSTANTANEOUS PHOTOGRAPHS, — ANIMALS, ETC.	May 14 .. Sept. 14.

All photographs for any of the above competitions must be received by the

FOURTEENTH DAY OF THE FOLLOWING MONTH,

and as received will be acknowledged in the columns of the *AMATEUR PHOTOGRAPHER*.

Entry forms on receipt of stamped addressed envelope.

"AMATEUR PHOTOGRAPHER" MONTHLY COMPETITIVE PAPERS, 1890.

THE following Prizes are offered for competition every month: —

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th March	Optics.
28th April	Action of Light.
28th May	Exposure.
28th June	Plates and Films: their Development and After Treatment.

All MSS. to be addressed to the Editor, "*Amateur Photographer*," 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—*Shakespeare.*

In another column we deal with the apparatus and art sections of the Crystal Palace Photographic Exhibition. We must dismiss the first-named by saying that it is not representative of the photographic trades—due, we believe, to the fact that several prominent manufacturers and dealers determined not to give the Exhibition their support. Many photographers, amateur and professional, coming from the country, and who have been intending to select their apparatus for the season, have been, and will be, we fear, much disappointed. Our subscribers have written, saying they suppose Mr. Blank's new camera, etc., will be on exhibit, but we have in too many cases been compelled to reply in the negative.

In the art section some 1,500 frames are hung, and it is with feelings of great pride that we are able to state that the largest exhibits in the Exhibition are those entered by the AMATEUR PHOTOGRAPHER, which comprise the photographs contributed to the Fifth Annual "Prize Tour" Competition. The work of forty-four contributors is exhibited, comprised in no less than 258 frames, and numbering upwards of 400 prints.

The judges appointed by the Crystal Palace Company have awarded a medal to our Competitor, the Rev. W. Mann, M.A., S.C.L. (Oxford), Precentor and Canon of Bristol Cathedral, for his photographs illustrating "Three Weeks in Brittany." They include four prints, "Old Bits in Dinan," "A Market Scene, Dinan," "The Old Convent Gateway, Dinan," "Granny and Great Granny," "Coming from Market," "The Ruin of La Garaye," "La Grande Rue, Dol," "North Aisle, Coutances Cathedral," and the "Lady Chapel, Coutances Cathedral." The work has been done with an 8½ by 6½ camera, Optimus W. A. and R. R. lenses, chiefly on Derwent and Ilford ordinary plates, developed with pyro and ammonia, the prints being, with but two exceptions, Ilford bromide, and Watson's matt-surface, all platinotype hot-bath.

In our opinion, and we believe that of the judges, these pictures are the finest shown by any amateur photographer in the art section. The award will carry with it the AMATEUR PHOTOGRAPHER Gold Medal, being the first

prize offered in our competition. The other photographs will be adjudicated upon next week, and if possible the awards will be published in our next issue.

We note also that Mr. Martin J. Harding, a competitor, has been awarded a prize for work identically similar to that sent to us but entered in the general exhibits. Surgeon-General Newland (Burma), another competitor, secures a medal for work of the same character as that sent to us, which he has entered amongst the general exhibits. There are scores of photographs hung in the Amateur Section, which have been sent to the AMATEUR PHOTOGRAPHER Competitions, many of them having been successful in gaining our prizes.

We may add that the next largest exhibit was that of the Birmingham Photographic Society, winners of the Challenge Cup, there being 26 entries and 144 frames.

The two exhibitions of slides contributed to the AMATEUR PHOTOGRAPHER "Lantern Slide" Competition were quite successful. On Friday we were pleased to find so many respond to our invitation to "afternoon tea." We only regret that arrangements were not such as to permit of more personal contact, but we shall hope upon some future occasion to meet our friends at a less formal and more social gathering. On Saturday evening the lantern show was attended by an audience numbering at least 2,000 people, and the slides, to judge by the vociferous cheering, were greatly approved. As far as possible, four slides from each competitor's work and the prize slides were shown, except Mr. Austin's, the winner of the AMATEUR PHOTOGRAPHER Gold Medal, he having for some reason refused to comply with our conditions, which provided that the slides should be exhibited at the Crystal Palace, and be at our disposal for copying or other purposes.

* * * *

We have received, and publish in our correspondence columns, the letter sent by Mr. J. Howson, on behalf of the Britannia Works Company, to Mr. George Davison, the Hon. Secretary of the Camera Club, and Mr. Davison's reply. Mr. Howson's letter contains a very liberal offer

For Contents, Prize Competitions, Notices, etc., see page 208.

on behalf of his Company, and aims a death-blow at "traders'" medals. The Company offer the Camera Club £100 per annum for three years, subject to the conditions set forth in the letter. The Committee of the Club have, through their Secretary, practically refused the offer, and Mr. Howson asks us to allow the correspondence to be published, and invites public discussion.

* * * *

WE have some few suggestions to make on the subject of exhibitions, which, with the permission of the President, we shall lay before the members of the Camera Club, at their Conference to-day (Friday), and shall not fail to keep in view the exceedingly generous offer of the Britannia Works Company.

* * * *

IN answer to our editorial note last week, that we should be glad to hear from any one who had the ability and inclination to contribute a series of articles upon "Stereoscopic Photography," we are delighted to be able to announce that Mr. Valentine Blanchard, a past-master in that beautiful section of photography, has undertaken to contribute a series of articles. The first will appear in our issue for the 2nd of May.

* * * *

ONE of our subscribers, the Rev. E. J. Pope, Barnstaple, is about to take a tour through Germany, Nuremberg, etc., to Ober Ammergau. He will be glad of any suggestions as to route, places to stop at, etc. Will some of our readers help him?

* * * *

A PHOTOGRAPHIC society has been established at Worcester, mainly through the exertions of Mr. T. James, and already, we understand, the society numbers some thirty or forty members.

* * * *

IN our advertising columns we give full list of contents of the April number of the PHOTOGRAPHIC QUARTERLY. Mr. H. P. Robinson, when passing *proof* of Woodburytype print of "He Never Told His Love," says, "It is a capital copy of the picture, truly worth the price of the whole number." We are afraid that the portrait of Mr. George Davison will not be universally admired. We cannot, however, accept any responsibility in connection with it. The negative was selected by Mr. Davison, and the proof passed by him.

* * * *

THOSE practising photography in Gateshead should write to Mr. G. R. Johnston, Secretary of the Gateshead Institute Camera Club, James Street, Gateshead. This club has just been formed, and the Secretary will be pleased to give particulars to intending members.

* * * *

THE Croydon Camera Club is now fairly started, and we understand that the number of members is being added to daily. The club promises to be a success.

* * * *

By a letter received from the Secretary of the Chamber of Commerce, we understand it is proposed to organise an exhibition of photographic apparatus and pictures in the

centre of the City of London, from the 1st to 15th of June. It is pointed out that through the liberality of one of the City Companies the cost to exhibitors will be very small, the premises being granted free of charge.

* * * *

WE publish in our correspondence columns a letter suggesting the formation of a society for amateur photographers in Edinburgh. It is not for us to say how far the existing Edinburgh Photographic Society fills the want; our correspondent has his opinion upon the subject, and we shall be pleased to hear what other amateurs may have to say as to the desirability of forming a society exclusively for amateurs.

* * * *

THE Lancaster Photographic Society would be glad to hear from any gentlemen desirous of becoming members. The Secretary announces that the annual general meeting will be held on April 3rd; the society is making good progress.

* * * *

A SUBSCRIBER, in thanking us for our invitation to the Crystal Palace, writes, "The thanks of all amateur photographers are, I am sure, due to you for the immense amount of trouble you take in furthering their hobby, and in my opinion a large portion of the wide-spread interest in, and great popularity of, amateur photography is due to the energy, knowledge, and tact you have displayed in your post as Editor of the AMATEUR PHOTOGRAPHER."

* * * *

IT will be remembered that we called attention to the fact that a photographic society was about to be started by the Y.M.C.A. We have just received the following communication: "A photographic society has been formed in connection with the central Y.M.C.A. at Exeter Hall, entitled the 'Exeter Hall Camera Club.' The club has been divided into two classes, 'Members' and 'Field Members,' and to the latter class ladies will be eligible for membership. Members will have the privilege of using dark-rooms, etc., and purchasing chemicals and appliances at cost price. Popular lectures, of an instructive nature, on photography will be given from time to time, exhibitions of members' work, outdoor excursions, and other advantages. Applications for membership, etc., to be addressed to G. J. Ingram, Hon. Secretary, Exeter Hall Camera Club, Exeter Hall, W.C."

* * * *

WE have received a letter from Mr. Alex. Keighley, in which he says, "I only yesterday got the 'Home Portraiture' number, which in my opinion is a great advance even upon the many excellent Special Numbers previously issued. . . . Allow me to say that I attribute much of whatever success I have gained to the valuable hints and useful information contained in the pages of the AMATEUR PHOTOGRAPHER, and to the stimulus and encouragement given by its competitions."

* * * *

NOTE.—The Editor of the AMATEUR PHOTOGRAPHER will be at the Crystal Palace Photographic Exhibition on Saturday, from 5.30 to 8 p.m., and will have much pleasure in meeting ladies or gentlemen who may be visiting the Palace, at the AMATEUR PHOTOGRAPHER stall, blocks H-I.

Letters to the Editor.

CONSTRUCTION OF CONDENSERS.

SIR,—In answer to a query in the AMATEUR PHOTOGRAPHER about hollow lenses filled with liquid for condensers—(1) The formula for the focal length of a lens consisting of a glass plate (parallel sides), a lens of liquid (plano-convex), and a glass in form of a segment of a sphere, with probably nearly concentric surfaces, would be rather complicated in appearance, though really not difficult to use. If we, however, neglect the glass covers entirely, which, as they are thin, will not make much difference, we have, using the usual letters, viz.:

r = radius of curved surface;
 t = thickness of lens;
 u = index of refraction of liquid;
 f = principal focal length.

$$\frac{1}{f} = \frac{u-1}{r} - \frac{\frac{u-1}{t}}{\frac{r}{u-1} + \frac{t}{u}}$$

This gives f , when r , t , and u are known.

If we neglect the thickness of the lens, we have simply

$$f = \frac{r}{u-1}.$$

I cannot quote from memory the value of u for glycerine, but it will be found in tables of refraction indices. I think it is about 1.4.

Thus with such a lens, if the radius of the sphere is 8 inches.

$$f = \frac{8}{1.4-1} = \frac{8}{.4} = \frac{80}{4} = 20 \text{ inches,}$$

and two such lenses close together would have a focal length of 10 inches.

It is very easy to find the focal length of such a combination practically. Set up some brightly-illuminated object, the lenses, and a focussing screen, and adjust so that the image on the screen is the same size as the object, and at the same time quite sharply defined; then measure the distance from object to focussing screen; one fourth of this is the focal length of the combination.

(2) The best arrangement when using any condenser for enlarging is when the rays from the lamp, after passing through the condenser, come to a focus just where diaphragm of the lens is to be placed.—Yours, etc.,

M. W.

* * * *

AMATEUR PHOTOGRAPHIC SOCIETY FOR EDINBURGH.

SIR,—It must have occurred to many of your readers that Edinburgh does not possess a society which is a sufficient expression of the large amount of amateur photography which exists within it. The present society is encumbered with professionals, who are no help to amateurs, but whose presence is rather a drawback to amateurs expressing their views. There is surely sufficient public spirit among the amateurs of this city to support a purely amateur society who would not be afraid to allow their proceedings to be seen of their brethren.

By inserting this letter you will confer a favour on some who are looking in that direction, and if there is any response to the sentiment, a meeting could be called to inaugurate a society.—Yours truly,

JOHN PIRIE.

Edinburgh, March 13th, 1890.

* * * *

PROPOSED CITY SUMMER PHOTOGRAPHIC EXHIBITION.

SIR,—It has been decided by the Photographic Trade Section of this Chamber to organise an exhibition of photographic apparatus and pictures, to take place in the very centre of the City of London from the 1st to the 15th June next. It is believed that one of the largest of the City companies will kindly give the section the free use of its hall and rooms for this purpose. The movement, as will be seen from the list of patrons and vice-patrons, is likely to receive considerable attention from the general public as well as from those interested in photography.

Exhibitors will be expected to provide for the insurance of their own exhibits, and as the premises will be given free of charge, the only expense to be incurred will be that of police and

other supervision, and such printing as may be required for cataloguing, together with the necessary advertising.

The liability from each exhibitor under these various heads will probably not exceed the amount of, say, £2.

This, it is believed, will be the first photographic exhibition held on an important scale, and particularly in the City of London, to which admission will be free of charge. It is expected, as a result of this arrangement, that the attendance will be very large, and exceptional means will thus be supplied of making it successful both as a matter of publicity and also of business. I am therefore desired by the Committee to inquire whether you will be disposed to exhibit at this exhibition, and, if so, what space you would probably require?

Any expenditure incurred will be entirely under the control of the Committee of the section, i.e., practically the exhibitors themselves.—Yours faithfully,

KENRIC B. MURRAY

London Chamber of Commerce,
 Botolph House, Eastcheap, E.C.

(Secretary).

* * * *

TOUCHING UP.

SIR,—I would wish to bring before the notice of your readers a process (may I call it) in photography which strikes me as being of considerable service, regard being had to the system of "touching up" so generally in vogue at the present day, and which, while, may be, it detracts from the exactness and truthfulness of a likeness, brings art to bear upon art, and so helps towards attaining the end which vanity on the one hand, and pecuniary gain on the other, seem bent on attaining, viz., the production of an elegant and artistic picture. After repeated trials, I have remarked that a certain weak solution of potassium cyanide (best applied with a fine-pointed brush) will remove wholly or in part the dark tones in albumen prints (due, I presume, to the silver's removal and exposure of paper, or less likely to the formation of some white salt or other), but without in the least noticeably affecting the albumenised surface; any superfluous KCN may be removed by brush water-washing. The poisonous nature of the reagent need not be commented upon. Of course on the strength of the solution depends the efficacy, for a little too strong an one leaves a yellow stain sometimes, even after the lapse of a few days or weeks; but this, if I am right in principle, need present little difficulty. The addition of a little thickish gum water lessens any tendency it may have to blur, i.e., make starlike spots or wavering-edged lines.

The chief methods at present employed, as known to me, for retouching the print is the brush use of the familiar photographic tint, and this works hand in hand with the one under consideration; for, in the latter case, after "local" toning, or even wholly obliterating a portion of the tones, free use may be made of the inevitable brush, according to requirement. Hence an admirable use may be found in whitening eyes, linen, etc., or doing away with any portion of shade of print, thus often adding very considerably to the general effect. I enclose samples of the work, kept several months.

I would add that I am but an amateur, and many of your journal's readers, I apprehend, are also of that genus, and if the suggestion I have made, verified as it has been by several of our humbler members of the brotherhood, shall be found to be of any value, it will give me great pleasure to reflect that some little additional matter has been added to that great store of knowledge which in the department of art, to which your paper is so sedulously devoted, has had such good and wondrous results.

If, too, use has already been made of the process suggested, or of some similar one, for attaining the results sketched, to this letter may possibly be drawn the attention of some who do not know of it, and to whom in due course, under perhaps some especial circumstances, it may be of good service.—Yours, etc.,

A HUMBLE BROTHER OF THE CRAFT.

* * * *

CRYSTAL PALACE PHOTOGRAPHIC EXHIBITION.

SIR,—In response to your kind invitation, I attended the above on Saturday evening in order to see the AMATEUR PHOTOGRAPHER lantern transparencies projected on to the mammoth screen by that past-grand-master in lantern management, Mr. W. Brooks. I need hardly say that amongst those shown there were many slides of surpassing interest and splendid technique, and I should much like to have sent you a detailed criticism of

them; but my object in writing this letter is a different one, viz., to point out to stallholders the undesirability of their closing so early on such nights as there are evening attractions like those provided on Saturday.

I came out of the lantern show about 8 o'clock, intending to do the apparatus, but before 8.30 most of the exhibits were covered over and the attendants gone. At the same time crowds of people were passing up and down the nave; and doubtless many workers who can only snatch an hour or so of an evening were, like me, doomed to disappointment.

Exhibitors should take note, for their pockets' sake.—Believe me, yours very truly,
H. MACLEAN.
March 15th, 1890.

* * * *

HAND-CAMERAS IN THE PUBLIC PARKS.

SIR,—What is really the law on this subject? I was told by one of the keepers in Wanstead Park that the bye-law under which they prohibit photographing in that park is framed to prevent obstructions by persons using tripods or other erections for the purpose of photographing. This, seemingly, would not prevent the use of a hand-camera. At all events, I do not see how the use of one is to be prevented, unless there is a law against attempting to take a photograph, in the same way that it is illegal to present an unloaded pistol at any one. The amateur does not always know if he has taken a photograph or not; how much more difficult must it be for a park-keeper to know if one is being taken.—Yours truly,

CHARLES F. STEEL.

* * * *

LIBERALITY OF A TRADING FIRM.

SIR,—May I beg you will insert enclosed correspondence in your next issue. The matter appears to me of sufficient interest to require public discussion as to what will be the best way to dispose of the gift in question.

I may say that my own feeling is to offer the sum as a scholarship, to be competed for by examination amongst the students of the schools of photography at the Polytechnic, South Kensington, etc.; and that the earning of such scholarship should carry with it the necessity for a year's residence and study at one of the best schools of photography on the Continent.

I venture to think this method would tend to elevate the art-science, and place it on a level with other special subjects, which are already endowed in a similar manner.—I am, etc.,

Ilford, 17th March, 1890.

JOHN HOWSON.

[COPY.]

"Brockenhurst, Ilford, March, 1890.

"My Dear Sir,—In looking over the programme of the Conference, I see amongst the agenda, a proposal to abolish trade medals at exhibitions. Now, though I hold views on this subject opposed to yours, I am quite ready to admit that general feeling is against me, and that being so, it is manifestly for the benefit of photography that my views should be put aside and trade medals should disappear. Therefore the Britannia Works Company will in future abstain from offering any such medals. This I hope will be some little help in clearing the way for a prompt and easy settlement of the question, as my firm is one of the principal offenders. I take this opportunity of recording my earnest conviction that, however ripe the time may be now for such a sweeping change, in the past the giving of trade medals has served a good purpose by stimulating competition and bringing to exhibitions good work, which would have been absent in many cases without such inducement. I claim, moreover, to have credit given us for a real desire to further the art of photography, as well as our own ends, in what we have done in the past. To prove that we have been and are to a great extent disinterested in our motives, I am pleased to inform you that the Britannia Works Company have generously placed at my disposal the sum of £100 per annum for three years, as a scholarship to be used as may best seem adapted to further the interests of either the art or science side of photography, with an expression of preference for the science side. To the Camera Club as the leading spirit in all forward movements in the art, I desire to transfer the generous gift, and I trust the Conference will see their way to accept it, and that we may be able to dispose of it in a fitting way.—Yours faithfully,
"G. Davison, Esq.

[COPY.]

"Camera Club, 14th March, 1890.

"Dear Sir,—The Committee of the Club discussed the subject of your kind offer at their last meeting on Thursday last, and requested me to thank you for your generous proposition. At the same time it was thought that the best way of applying the gift, or rather,

the best course to adopt, would be to place the fund entirely at the disposal of a Committee, or Trustees from, independently of any one society, but rather from the Photographic Society of Great Britain and other leading societies conjointly. A representative Committee formed in this way would probably be able to suggest a method of applying such a fund to advantage either by offering inducement for research and experiment in certain directions, or for original work of value in any way bearing on the advancement of the science or art of photography.—I am, dear sir, yours faithfully,

"John Howson, Esq.

"G. DAVISON."

* * * *

GAS CYLINDERS.

SIR,—I should like to refer briefly to the kindly criticism of Mr. E. H. Cartwright on my former letter regarding this subject. I am fully aware that the hydraulic test is a perfectly fair one in so far that a uniform pressure over the whole of the inner surface of the cylinder is created, just as it would be when a cyl. is charged with gas.

If, however, my third paragraph is read again, I hope it may be seen that the point I desired to bring under special notice was whether the hydraulic test is sufficient to prove that a cylinder charged with gas would merely rip if the strain from the gas were greater than it would stand.

The problem I should like to see settled, if not already settled, is this: Because a cylinder when tested and burst under hydraulic pressure merely rips, is it legitimate and scientific reasoning to maintain that another cylinder when charged with compressed gas will merely rip, should it also burst?

I think the concluding three lines of the third paragraph in my former letter expressed what I meant, thus: "Therefore, surely it is not correct to reason from the hydraulic test that a cylinder would not explode, but only 'rip up,' when compressed gas is the motive power within."

I can quite follow Mr. Cartwright's argument as to the sudden and vast expansion of gas when a cyl. explodes from a union of the mixed gases, but I ask your readers to kindly read the letter by Mr. John A. Hodges, in *Photography* for March 7th, page 157. This settles the matter as regards what I ventured to offer as my humble opinion as regarding a cyl. exploding merely from compressed gas. Mr. Hodges says: "Gas engineers invariably adopt the water test on account of its safety, well knowing the consequences which would ensue were the test performed by gas. Moreover, bottles have burst before now in the course of charging (and no gas compressor of any experience will deny the truth of the statement), and when they have done so, the bottles have flown to pieces with more or less violence."

Mr. John A. Hodges adds many more interesting remarks, and I have only quoted these in reference to a cyl. charged with compressed gas, not merely ripping, as it is popularly supposed.

The important bearing this matter has is manifest when we consider the accidents liable to arise with a cyl., such as a knock or fall, and, in such case, the risk of explosion, as Mr. Cartwright fairly points out.

Mr. Hodges appears sure of his information, and it will thus be seen from his remarks what danger is run when cylinders filled with compressed gas are roughly treated.

I shall be very happy to be set at rest on the matter, and am eager to be convinced without being compressed myself.—Yours faithfully,

C. HETHTON LEWIS.

Brighton, March 17th, 1890.

P.S.—In case my remarks are not quite clear, I venture to hope that the chief subject of discussion will be: Supposing a cylinder to have ordinary compressed gas, of one kind, within, would it, if it had a jar, knock, or fall, merely rip—if it burst?

* * * *

DRY PLATES IN SWITZERLAND.

SIR,—I quote following from a letter recently received from Swiss Customs authorities, which will reply to "Greenwood's" query in your last issue: "Ces appareils peuvent circuler librement et sans payer de droits de péages, à la condition de porter des traces évidentes d'usage et d'être déclarés aux agents de notre administration.

"A moins que les plaques sèches ne soient en quantité un peu importantes, elles ne sont pas non plus soumises aux droits."

—Your obedient servant,

JOHN HOWSON.

NOTE.—We are compelled to hold over several important letters, owing to the heavy demands upon our space.—ED: AM: PHOT:

The Complete Photographer;

OR,

THE MODERN RECREATION OF CONTEMPLATIVE MEN.

By H. P. ROBINSON.

CHAPTER VI.

EXPOSURE—(continued from page 155.)

PHOTOGRAPHER.—Now we shall get along without interruption. On the screen we have the image of some trees in the near middle distance, a fence partly hidden by dwarf apple and other trees, and some gardening tools in the foreground. We have no stop in the lens, that we may the better see the composition of our picture, but before we focus we will put in a smaller stop, let us say $f/16$; $f/23$ is the smallest stop I ever use for pictorial photography. Architectural subjects sometimes require a smaller diaphragm. Now get the image into what you think is correct focus.

PUPIL.—I wish I could see better. May I not focus with the full aperture?

PHOTOGRAPHER.—Certainly not. You must get your last focus when the stop you are going to use is in the lens. I have excellent reasons for this which I will explain by and by; we have no time now. Let me look under the focussing cloth. You have got the trees in focus, and all the foreground is blurred. If you must blur, let it be in the distance. Until the opticians can, with the fixed lens, enable us to do in the camera what we do with the rapidly changing eye, that is, practically see everything in equal definition throughout, we must be content with the best compromise we can get. The optician may, perhaps, some day give us that perfect imperfection, a lens that will so distribute the focus as to afford us reasonable definition all over, as the pinhole gives us unreasonable want of definition everywhere. We partly get over the difficulty when the subject will allow by the use of the swing-back. For the purpose of getting the gardening implements in the foreground into focus, and giving the rest a chance, we must swing out the back at the top. The reason for this I had better explain. The nearer an object is to a lens the greater length of focus is required, therefore if the rays of light from the foreground—the nearest object—that have passed through the lens can be made longer than those from the more distant trees the definition is more likely to be equalised, and as the image of the foreground comes on the top of the ground-glass we have to swing the back so as to lengthen the focus at the top.

PUPIL.—Quite so. There it is done.

PHOTOGRAPHER.—That curious anomaly, the scientific artist, who must have everything *true*, will tell you that the whole image is now out of drawing. Here is what one of them says:—"It throws the whole picture out of drawing, the relative positions of the planes are altered, the relative definition in the planes is altered, and therefore as a rule the picture is artistically injured." And he goes on to attribute what he calls this "rule of thumb" use of the swing-back to his usual man-of-straw, the "untrained craftsman." All that he says is quite true as a matter of theory, but I defy the cutest of his school to point out bad drawing in a photograph of a landscape, and it is practical picture-making we have to do with. The essence of fine art is poetry, not science, and the reason we have so little art in photographs is that we have more facts than poetry in our natures, and the scientific side of an art fosters the pursuit of facts.

PUPIL.—

"No theory e'er comes up to practice;
No argument like matter-of-fact is."

PHOTOGRAPHER.—That cuts both ways. Don't *you* become poetical in this stage of your pupillage, or you will drive *me* to quoting, which may delay our progress. We now have the image ready to be exposed. The foreground may be described by that obnoxious word "sharp," for with the naked eye we can see every detail, even to the orange spots on the wings of the brimstone butterfly that has just settled on the handle of the garden roller; the apple trees are in satisfactory definition, and the more distant trees are less in focus, but without blurring, fuzziness, or astigmatism. This is as it should be. We will now put in the plate-holder, draw the shutter, and expose a plate. As a matter of precaution we will cover the camera with the focussing cloth, but a well-made instrument ought to be able to stand a good deal of sun without admitting a trace of light.

PUPIL.—Are you not going to use the shutter?

PHOTOGRAPHER.—Not for this subject. There are more negatives spoilt by the use of the shutter than by any other means. It is to shutters we may in a great measure attribute the vast mass of black and white, soot and white-wash photographs with which nearly all amateurs' albums are crowded. It is these photographs that righteously move the wrath of the "naturalistics," in which you see I join them for once. Yet, with the usual contradiction, they are the very teachers who recommend the quickest exposures. It is to their mistaken method of getting rid of the evil I object. They soften by putting the image out of focus; I would retain definition, and obtain gradation and subordination by suitable exposure and other legitimate means. There is more loss of atmospheric effect from under-exposure than over-definition. Now the youthful amateur buys instantaneous shutters and instantaneous plates, and thinks, as it is natural he should think, that he will get instantaneous pictures with them. He has bought a machine warranted to produce a certain result, and he expects the music to come when he turns the handle. Do you know that I have had the pleasure of seeing the smile of incredulity spread over the beaming countenance of a two-months amateur at my thirty-year-old ignorance when I told him I could not get a *picture* except of the sea, or some other equally brilliant scene, with a so-called instantaneous shutter? He said he had read it in italics in a book that "the first principle of all artistic work in photography is quick exposure," and that there was "nothing to be said for time exposures." So he meant to under-expose all his life, and thus become an artist! This shows how dangerous it is for inexperienced persons to write about what they do not understand. Snap-shot accidents may be interesting, but they are not art. Art is the result of intention.

PUPIL.—What is "instantaneous?"

PHOTOGRAPHER.—Few pupils who use the word think of the meaning of it. It must be without duration. Now, a flash of lightning has lately been proved to have duration, therefore lightning is not quick enough to justify the word. In photography it may be taken to mean some fraction of a second. As the word instantaneous is so misleading, it would be better to divide exposures into two classes, "quick" and "time," one of a second or over being a time exposure. You may take it as a rule that in taking inland scenery you will not get a picture in less than one second, or even three or four with large lenses. Of course, I am not speaking of hand cameras and short-focus lenses, or photographs taken with large apertures at the expense of necessary definition. So we will proceed. We will expose three plates—No. 1, one second; No. 2, two seconds; No. 3, five seconds—and in developing will show that there may be considerable limits in exposure by getting good negatives from each. During our long talk we have done a foolish thing, we

have left the plate with the shutter drawn ready for exposure. Now, although the camera may be perfectly light-tight, a plate suffers when left in this way. The minute portion of light shut into the camera when the holder is placed in position possibly becomes active. It has been proved that sunshine can be bottled for future use; anyhow, a plate left for a long time in a camera with the shutter drawn ready for exposure, becomes more or less fogged, as you shall see this one will be, for we will expose it and put it aside, and then expose the three we require. The lesson is that a plate should be exposed as soon after the shutter is drawn as possible, and if any cause of delay is found, the shutter should be replaced for the time. In exposing, if you do not use a sunshade, lift the cap upwards so as to shade the lens from the light from above, and protect the lens from the direct rays of the sun. If the sun shines on the front glass, the plate will be hopelessly fogged. You see, I take the time with a watch made to tick seconds loudly, so that I have no occasion to look at the hand, and it is most useful to have the eyes free at the moment of exposure. The hand marks the seconds on the outer edge of the dial with dead beats. The ordinary trotting second-hand of a watch is very misleading.

PUPIL.—Cannot you trust to counting?

PHOTOGRAPHER.—You shall try, I will test you. Count twenty seconds. . . . You have gabbled through them in thirteen! This is the usual amateur measure, and another cause of under-exposure.

PUPIL.—That watch seems an old favourite.

PHOTOGRAPHER.—It is as old as my photographic life. Invaluable for measuring seconds. In other respects it is not a conscientious watch, and is given to playing practical jokes with the hours.

Winter Work.—XXIV.

By T. C. HEPWORTH, F.C.S.

PHOTOGRAPHY BY MAGNESIUM LIGHT.

(Continued from page 175.)

AN ingenious method of firing the magnesium powder in a lantern of the kind which I have described is given by an American writer. This method does away with the necessity for a spirit stove, but is only available where there is gas. It has the disadvantage of employing an explosive in the shape of potassic chlorate, but as this is not associated with any sulphur compound, it is not unsafe, provided that caution is exercised in its use. The mixture suggested is magnesium one part by measure, chlorate two parts. The chlorate should be powdered separately and mixed thoroughly with the metal, and the quantity used for one charge should not exceed sixty grains, unless under exceptional circumstances. The mixture can be fired by a long taper, but the plan given for ignition by gas is more convenient. In the lantern box is suspended a square of wire gauze, or it may be supported on the ring of a retort stand, and on this gauze, upon a square of tissue paper, is placed the charge of magnesium and chlorate. Eight inches or more below this gauze is brought a gas pipe crowned with one of those pin burners used in tobacconists' shops, which when turned up to the full make a long thin flame several inches in height. This flame is governed by a tap within easy reach of the operator, and at the commencement of proceedings the gas is turned down to the blue. At the right moment the tap is turned fully on, and at the same time the magnesium is fired and the flash produced.

The contrivances already before the public for the production of flash-light pictures are almost as numerous as in-

stantaneous shutters, and they present almost as much variety as that much invented contrivance. Some of these are mere toys, and are of no use at all unless they can be fired in series. As a rule those which are of the simplest construction are the best to adopt. One or two of these I will now notice.

Messrs. Beck, of Cornhill, supply the contrivance shown at fig. 1. This consists of a glass tube with a funnel open-

FIG. 1.

ing at the top for the admission of the magnesium powder, and a little spirit furnace in front, which is attached to the tube by a helix of wire. This is fired by the help of a pneumatic ball and tube.

Messrs. Hinton have introduced the flash-light arrangement shown at fig. 2. Here we have the same idea carried

FIG. 2.

out in vulcanite, the opening for the powder being covered when the apparatus is in use, by the sliding sleeve *f*. It is evident that both these contrivances could be multiplied, and that several could be actuated by a puff of air from one source.

In Leisk's centrifugal flash lamp we have a carefully thought-out and very efficient lamp, the construction of which can be understood by reference to the sectional diagram, fig. 3. The lamp is cylindrical in form, and the

FIG. 3.

spirit and wick are held in an annular well, DD. The wick is of indestructible asbestos, and just enough spirit is poured into the funnel W to soak it well. When this wick is lighted, the flame forms a ring-shaped wall of fire, into which the magnesium is projected from the centre in a novel but effective manner. Z is a round table of metal, the supporting stem of which has at its base a coiled spring, P, and a horizontal ratchet wheel, the teeth of which engage a detent which is connected with a piston B. This piston is furnished with an outlet tube to which an ordinary pneumatic ball is attached. The apparatus is set for action by giving the table Z one or two turns with the finger and thumb, so as to wind up the spring; after which a small charge of magnesium powder is scattered on the table and the annular wick is lighted. When the pneumatic ball is pressed, the detent releases the ratchet, the table spins round, and by centrifugal force scatters the powder into the wick which surrounds it, producing a large volume of light with a very quick flash.

Some of the best photographs which I have seen, and which cannot be distinguished from pictures taken by daylight, have been executed by means of this lamp, or rather by a congregation of lamps of this description. These pictures were taken by the aid of four centrifugal lamps, supported on the ingenious form of stand patented by Mr. Slingsby, of Lincoln. This stand can be raised or lowered to any convenient height above the sitter's head, and it is fitted with horizontal arms, which support the lamps in any desired position. In order that the lamps may all be fired at the same instant, the tube from each is connected with one pneumatic ball (W) of large size, which has a nozzle (X) like

FIG. 4.

FIG. 5.

that shown at fig. 4, with quadruple nipples. The complete apparatus is supplied by Messrs. Marion.

The same firm make a simpler and cheaper form of lamp which is also efficient, but does not give such a mass of flame as that just described. The diagram, fig. 5, shows that this lamp follows the design of one already referred to, in which a charge of powder is projected into the centre of an argand gas burner. Here, however, the flame, although a circular one, is produced by a spirit lamp. The spirit is contained in the small annular chamber NN, and burns at the wick K. BB is a bent pipe which has its upper orifice at a lower level than the wick, and it is charged with magnesium powder by the temporary aid of a small tin funnel before the lamp is lighted. The lower opening of the pipe B, which emerges from the side of the lamp, is connected with an india-rubber tube and pneumatic ball, and the compressed air from the latter is sufficient to propel the powder into the flame.

Some time ago I devised a cheap experimental flash light apparatus by supporting a common clay tobacco pipe in such a way that its bowl stood upright over the centre of one of the little spirit stoves already mentioned. Before lighting the spirit I put a charge of magnesium inside the bowl of the pipe, and fastened a pneumatic bulb and tube to its mouthpiece. Such an arrangement answers well, if a pipe can be procured with sufficiently wide a bore to admit sufficient air to expel the powder. I see that a contributor to an American journal has recently still more simplified the same idea by wrapping round the bowl of such a pipe a pledget of absorbent cotton, which he soaks in spirit, so that no stove is necessary.

(To be continued.)

AMATEUR PHOTOGRAPHERS AT TEA.—On Friday night a new departure was inaugurated in connection with the Photographic Exhibition at the Crystal Palace, an invitation "Afternoon tea" being given by the proprietors of the AMATEUR PHOTOGRAPHER. There was a good attendance, and prior to the tea there was a lantern show of a very interesting nature. The slides shown were some of those which had been sent in for competition, and many of them reflected great credit on amateur producers, whose numbers increase largely year by year.—*Globe*.

Experiments with Oxygen Cylinders.

THE following account is taken from the *Glasgow Herald* of March 13th:—

"A series of experiments were conducted yesterday at Stevenson by the Scotch and Irish Oxygen Company, Limited (Brin's Process), for the purpose of demonstrating the absolute safety of their cylinders for containing compressed gases. It will be remembered that a fatal accident occurred to the foreman of their works at Polmadie by the bursting of a cylinder some six weeks ago, and the impression was conveyed to the public that the explosion was due either to some defect in the cylinder, or to its strength being overtaxed by being charged to an excessive pressure. A thorough investigation was, however, made into the cause of the accident, and the facts disclosed left no doubt that it occurred through a mistake on the part of the unfortunate man himself. It was clear that he had introduced oxygen into a cylinder which was already partly charged with hydrogen, these gases forming an explosive mixture when brought together. One fact especially which pointed at once to this conclusion was that the main portion of the exploded cylinder, found almost on the spot where the accident occurred, was almost too hot to be touched; whereas the portions of cylinders which have since been intentionally burst by being subjected to excessively severe treatment were found to be perfectly cold. In consequence of this erroneous impression it was thought advisable to subject the cylinders to an exhaustive series of tests, so as to prove beyond dispute that they are thoroughly adapted for the purpose of carrying the gases and capable of withstanding the most extreme amount of rough usage to which they could possibly be subjected during transit from place to place. The cylinders used are of different sizes, varying from 1 ft. long by $3\frac{1}{2}$ in. diameter to 6 ft. 6 in. long by $5\frac{1}{2}$ in. diameter. They are made of mild wrought steel $\frac{1}{4}$ of an inch in thickness, and before being used each cylinder is subjected to a hydraulic test of at least twice its working pressure, and is afterwards stamped with the pressure to which it was subjected, the date of the test, and the test mark. The cylinders are re-tested periodically, and for the purposes of safety the custom of the Company has been to paint those for the different gases in distinctive colours, so as to avoid the danger of mixing. As a further precaution, every cylinder which is brought into the works after having been in use is at once emptied. To make the recurrence of such a misfortune as the recent accident absolutely impossible, it has been decided to adopt a left-handed thread for the valves on the hydrogen and coal gas cylinders, so that by no possible inadvertency can they be filled at the oxygen pump. A number of experiments were made about ten days ago which gave excellent results. A 6 ft. 6 in. cylinder, weighing about 1 cwt., was twice raised to a height of 35 ft. and dropped horizontally upon a solid iron block 12 in. square and weighing $3\frac{1}{2}$ cwt., each blow bending it to the extent of about three-quarters of an inch. It was then dropped vertically on to its round end, having a clear fall of 31 ft., when it was found that the impact had only flattened a part of about the size of a penny piece. It was next placed across the iron block, and an iron weight of $6\frac{1}{2}$ cwt. dropped on to its centre from a height of 35 ft., the blow crushing in the side to the extent of $\frac{7}{8}$ of an inch. The cylinder was subsequently placed on two iron blocks, set 4 ft. 1 in. apart so as to support the ends, and the same weight again let fall upon it from the same height, with the result that it was bent $4\frac{1}{2}$ ins. from the straight, but did not explode. Another cylinder was afterwards tried in the same manner, with the exception of the crushing blow, and in this case even a more satisfactory result was obtained, as it was bent to the extent of $7\frac{5}{8}$ ins. by the bending blow and still remained intact. A smaller cylinder, measuring 31 ins. long, by $5\frac{1}{2}$ ins. diameter, containing 17 lbs. liquefied carbonic acid gas, was also dropped crossways and vertically from the same height, and was afterwards flattened to the extent of $1\frac{3}{4}$ in. by dropping the $6\frac{1}{2}$ cwt. weight upon it, without injuring it otherwise than in shape. Each of these tested cylinders were subsequently found to contain the full quantity of gas, and to be perfectly sound. Yesterday's experiments were of a similar character, and were equally satisfactory. A 6 ft. 6 in. cylinder, weighing 107 lbs., including the contents, was dropped four times across the iron

block from a height of 35 ft., these trials producing a bend of 2½ ins. It was also allowed to fall on its end, with little perceptible result. A smaller cylinder was treated in the same manner, and sustained no greater injury than a few dents. From these particulars it will be seen that the tests were eminently satisfactory, for it is inconceivable that such cylinders during transit could undergo anything like the severe treatment to which they were subjected, while it was evident that they still possessed a considerable reserve of strength."

Science Notes.

THE particulars of the work done by the expeditions sent out to observe the solar eclipse of last December are beginning to appear. The French astronomer, Pluvinel, who was stationed in Isle Royal, in the West Indies, reports that his photographs of the corona show that the general aspect of that solar appendage was similar to that seen during the eclipse of January, 1889. Its extension from the surface of the sun was but small, and the appearance of the "aigrettes" seemed to point to the existence of streams of matter, acted upon by a force of projection normal to the solar sphere, and a centrifugal force caused by the sun's rotation.

The well-known Midland engineering firm of Geo. Salter and Co. have made to the order of the patentee an automatic photographic machine. It is on the "penny-in-the-slot" principle, and some trials which were made last week showed it to act uncommonly well. There is to be a "Press view" during the present week, but possibly too late for details to appear in the AMATEUR PHOTOGRAPHER. Our own opinion is that the best plan would be to omit the works and "put a man inside;" it might then be as great a success as the Chess Automaton.

The *Observatory* for March contains a Woodburytype print of the corona from a negative taken by the late Father Perry during the solar eclipse of last December, which he went to South America to observe. The telescope used was a new short-focus reflector devised and made by Mr. Ainslie Common, and, notwithstanding the briefness of the exposure, the solar prominences and the brighter parts of the corona are all reversed, showing the immense light-gathering power of the instrument.

The report of the Harvard College Observatory (U.S.), just issued by Professor E. C. Pickering, proves that astronomer to be doing an amount of work which can only be described as "prodigious." Telescopes have been planted on Wilson's Peak in California, and on a lofty peak in Peru. At each station, and also at Harvard, a great number of celestial photographs have been secured. But not satisfied with this, the firm of Alvan Clark and Sons have in construction for Professor Pickering a telescope whose objective will be a gigantic portrait lens, 2 feet in diameter, and with a focal length of only 11 feet. The cost of this unique instrument (£10,000) is defrayed by a New York lady, Miss Bruce.

Surely, with all this photography of the heavens going on, it is time for our photographic societies to bestir themselves, and see that the photographic survey of the earth is not neglected. The old couplet says:

"If each about his own door sweep,
The city will be clean."

And if each society will only obtain a photographic record of its own district, a task of the utmost usefulness will be accomplished. We advise our readers to write to the Hon. Secretary of the Birmingham Society for a pamphlet (cost, six stamps), in which the principles of a photographic survey are laid down. The address is Mr. A. J. Leeson, 20, Cannon Street, Birmingham.

The Royal Meteorological Society are holding an exhibition of instruments illustrating the application of photography to meteorology, at 25, Great George Street, Westminster. It closes this (Friday) evening.

It is well known that the art of making "blue prints" has been more studied in the United States than on this side of the "herring-pond." A correspondent of the *Scientific American* gives the following directions for the use in this method of albumenised paper. Prepare the following solutions:—

A.	
Citrate of iron and ammonia	3½ drms.
Water	2 ozs.

B.	
Red prussiate of potash	2½ drms.
Water	2 ozs.

Mix these solutions in equal parts (they will not keep long after mixing), and float the paper on the solution for half a minute. Dry in a warm, dark place.

Printing is done in the usual way, and all that is then necessary is to wash the prints in two or three changes of water. Such prints can be burnished, and give much better detail than the usual ones on plain paper.

Astronomical photography is just now undoubtedly the most important branch both of astronomy and of scientific photography. Mighty telescopes have been constructed—of which those at the Lick Observatory in California, and Mr. Common's noble reflector at Ealing, stand pre-eminent—to which such delicate "driving" mechanism has been attached that hour after hour the instrument points steadily at one star, and the image of that star falls on one spot on the sensitized plate. The chemical effect of the rays of light is cumulative, and hence by giving long exposures—hours in duration—we obtain on our sensitive plates the images of stars, nebulae, etc., which the human eye never saw, and probably never will see.

But the length of exposure which can be given in such cases is limited by the length of the period of darkness—the night—and by its clearness. Some thousands of "star negatives" have already been secured, but perhaps not half a dozen have been given an exposure of more than three hours' duration; twilight, clouds, etc., cutting short the possible amount of absolute darkness in this country to that amount.

What we would suggest to astronomers is that at least one observatory—one powerful telescope—should be erected somewhere within the confines of the arctic circle, say in Greenland—the farther north the better—where exposures of days and even weeks could be given in the long night which there prevails, and which at the North Pole itself is of six months' duration. Even with the best "driving clocks" the telescope needs the aid of the human eye applied to a companion instrument to keep it pointing truly, but we have no fear that plenty of workers could be found willing to brave the cold and the darkness, provided that the cause of science be advanced thereby.

With such lengthy exposures it is possible that the entire surface of the dry plate would be impressed by the light from the stars. The universe is—must be—infinite in extent, and the image of the far distant unseen stars would at last overlap one another. With such exposures, too, we might detect evidence as to the "dark suns" which are believed to be careering through space, and which are considered to be the only real cause of danger to the long continuance of our own solar system.

Even without the advantage of lengthened exposures it seems to us that an arctic observatory would be a good thing. What facilities for steady, continuous work during the winter it would afford! A double set of observers would be required; and when the "long day" came they could occupy it in developing their negatives and tabulating their results.

F. G. S.

THE second edition of Wheeler's "Book of Modern Photographic Labels" is to hand, and shows considerable improvement on the original. The labels for developers are brought up to date, and those for poisons are on red paper. We recommend every worker to have one, as he will find it of great assistance in avoiding confusion.

FOOTBALL AND PHOTOGRAPHY.—We have received a very excellent photograph, taken with a Beck's hand-camera, on a Wratten and Wainwright drop-shutter plate, of a football match, England v. Ireland, played at Blackheath. The picture shows us the "second try," gained by England. The work is by Mr. G. Stokes, of Lee, S.E., who has also shown us a very capital enlargement; the attitudes are well caught.

THE AMATEUR PHOTOGRAPHER has issued an extra number, containing reproductions of successful pictures sent in for their "Home Portraiture International Competition." It makes a bulky and most entertaining volume, and the reproductions of the principal prize pictures in autotype leave nothing to be desired. The first prize picture, entitled "Children of the City," is technically excellent, and has pictorial qualities of the highest degree of excellence; while the numerous other illustrations do the greatest credit to amateur art.—*Globe*.

Our Contemporaries at Home and Abroad.

THE *Revue Suisse de Photographie* for March contains a warning to amateurs as to the danger of some of the flash-light compounds at present on the market. There are also articles on "Phototypy," "The Prediction of Photography," "The Castle of Wildenstein," and a *resumé* of the resolutions of the International Photographic Congress.

The *Photographic News* says, "The latest photographic curiosity is the rhombohedral camera of Professor Cohn, of Breslau, by which a picture can be taken while the eye is regarding it in the glass screen. This is effected in the following way: Two rhombohedra of glass are placed in a special chamber just behind the camera lens, by which means two images are thrown upon the upper and lower halves respectively of the ground-glass screen, the eye looking along a path between the two rhombohedra. To use the instrument, a sensitive plate is put in place of the upper half of the ground-glass. When a sharply defined image has been obtained upon the lower glass, an instantaneous shutter is released in the interior of the camera in front of the upper rhombohedron, and the picture is obtained on the sensitive plate." Articles: "The First Optical Lantern (with illustrations)," "Athanasius Kircher, the Inventor of the Magic Lantern," "Rules of Photographic Exhibitions," "Chromo-Photography in the Printing Press," "The Crystal Palace Exhibition," etc.

The *Photographic Review*, touching on the question of rules for exhibitions, says, "One often sees that a well-known man appointed as judge is unable to be present, and thus leaves his two *confrères* to decide the knotty question; in such a case we hold it absolutely necessary that his place should be supplied by some one else, and that that some one else should not be appointed or suggested by the judges. One wonders sometimes who suggests the judges to the organisers of exhibitions, and if one man being appointed suggests those whom he would like to have serve with him. This, we imagine, is the only way in which some men are selected." Articles: "Lessons in Photography," "Wanted—an Index," "Photographic Faults," "A Means to an End," "What to Do," etc.

The *Practical Photographer* presents its readers with a fairly good process reproduction of a flash-light interior. Articles are given on: "Pioneers of Photography," "Photography as a Business," "Apparatus at the Crystal Palace," "Celluloid and Other Films," "The Lightning Studio," "Practical Work," etc.

The *St. Louis and Canadian Photographer* (St. Louis) says, "Negatives that will have to be intensified by corrosive sublimate require prolonged fixing, if possible in a fresh hypo solution, and have to be well washed. Any hypo left in the film will cause yellow stain. To see whether a negative is free from hypo, allow a drop of the water adhering to the plate to fall into a test glass filled with the following solution: Boil 1 part of arrowroot in 100 parts of water, and when cold add to every 3 ozs. of this one drop of tincture of iodine. The solution immediately turns blue, but the addition of the least trace of hypo will destroy this colour at once. This is a very delicate test." Articles: "Albumen Prints," "Slow Development," "Art and Science in Photography," "Photographed by Lightning," "Odds and Ends," "Posing and the Theatrical Profession," "The Intelligent Use of the Lens," "Flash Powder Experiments," "Lyonel Clark's Toning Process," etc.

The *American Journal of Photography* (Philadelphia) says, "The great advantage of the changing box compared to the ordinary double holders is the saving of weight and bulk. The reason why this elegant form of apparatus has not been more extensively used in this country is undoubtedly owing to the fact that commercial gelatine plates here do not run even in size. This of course interferes with the free passage of the plate in the grooves, and leads thoughtless persons to condemn the apparatus itself, when the fault really lies in the carelessness with which the glass is cut. We should be very glad to see the changing-box re-introduced, particularly as the original idea is due to an American." Articles: "Weights and Measures," "Local Intensification and Reduction," in which it says: "Negatives (no matter how long they may have been developed), if they are too dense in certain places, are to be laid in clear, soft water for about five minutes, until the film is uniformly wet, then remove the superfluous moisture with a piece of filtering paper, then

place the plate in an ordinary printing or retouching frame so as to lie perfectly level, and so the light will show through the negative, then moisten the parts to be reduced with the ordinary hypo fixing solution (1:4); this is also done with a soft brush pencil. After which carefully drop on more hypo, using a pipette or medicine dropper for the purpose, until the hypo stands all over the space to be reduced; then drop a single drop of concentrated solution of red prussiate of potash in the hypo on the plate. This will immediately assimilate with the hypo and reduce the space evenly and rapidly. As soon as the desired degree of reduction is attained, the plate is quickly immersed in a tray of water. Any person trying this experiment must bear in mind (1) that the first painting with the hypo must be carefully done; (2) after the hypo is dropped on, the slightest shaking will cause it to overrun its bounds; (3) that the red prussiate of potash is a strong poison; (4) not to experiment at first with a valuable negative." Other articles are: "The Silver Printing Bath," "Clouds in Lantern Pictures," etc.

The *British Journal of Photography* says, "What we have now to suggest is, that in enlarging and for similar purposes it would be frequently found not only more convenient, but advantageous in other ways, to direct the optical arrangement towards a white-washed wall or other white screen placed in sunlight, rather than employ direct skylight or a silvered reflector in general vogue. The pleasantest and most comfortable enlarging arrangement we ever remember to have used was a horizontal one, the illuminant being a stable door painted white, and opened to the proper angle to catch the sun, the enlarging table and easel being moved about accordingly." Articles: "Pictorial Definition in Portraiture," "The Present Position of Isochromatic Photography," "The Art of Retouching," "A Word on Eikonogen, Hydroquinone, and Pyrogallol," "Hardwick and Scott's Warm-Air Saturator," "The Crystal Palace Exhibition," etc.

Photography, in its article on "Medical Photography," says, "The question is before us: How much of this photographic work can the medical man himself undertake, how much must he leave to specialists? It is pretty clear that until skilled photographers are attached to hospitals, or can be obtained at short notice, the medical man must do all his photography of patients himself, or trust to some amateur who may be on his staff or among his pupils. In most of such cases an ordinary photographer would be unable at once to obtain the desired result, and the wholly unskilled medico would not even be able to give the photographer the necessary directions; so that the photographer employed would have to be specially trained for such work, and in some cases would require to be inured to the unpleasant duty. Our point here is that professional photographers for such work will require special training." Articles: "Failures," "The Camera and the Inns of Kent," "An Enthusiastic President," "The Crystal Palace Exhibition," etc.

Illustrations contains reproductions by the Meisenbach Company, of photographs, and thirty pages of interesting letterpress, interspersed with good wood engravings.

"Thursday Evenings" at the Camera Club.

BY ONE OF OUR STAFF.

ON Thursday, March 13th, lantern slides were shown at the Camera Club. Mr. Webber occupied the chair.

Before the exhibition took place, the Hon. Sec. handed round some collotype prints on Japanese paper and satin, by Mr. W. K. Burton. Some fine Japanese papers intended for experiment were distributed to those desiring pieces.

The Chairman then called on Professor Stebbing, who was present, to say a few words to the meeting.

In response, Mr. Stebbing exhibited some collotype prints brought over by him from Paris, which had been produced by M. Balagny. Some of these were on rough-surfaced papers. Reference was made to the rapidity with which the prints had been obtained, Mr. Stebbing stating that within three-quarters of an hour of giving a negative to M. Balagny about twenty prints were given to him. He thought that M. Balagny would introduce his method in England, and he saw no reason why the amateur

should not have his own machine at a cost of about £4, and make his own collotype reproductions.

An excellent show of lantern slides was then given, altogether about 200 slides being brought or sent up by Messrs. W. M. Robertson, Lane, Elder, Seyd, Ellis, Laurie, Fitz-Payne, Howlett, and Grimshaw. The lantern was worked by Mr. J. F. Roberts.

The subject on Thursday, March 27th, will be "Platinotype Possibilities," when Mr. W. Willis will read a paper. Meeting at 8 p.m.

Apparatus.

THE NEW "CYCLE" FOCUSSER.

MESSRS. J. H. SKINNER AND CO., of East Dereham, have just brought out an arrangement for rapid focussing which will be a boon to all amateurs, and more particularly to those who use long-focus lenses. Figs. 1 and 2 show the arrangement attached to the camera, as in use.

FIG. 1.

It will be seen from a reference to fig. 1 that there is provided, instead of the usual small pinion, a large wheel working in a rack outside the back. The large size of the wheel enables the

FIG. 2.

operator to rack out the camera in a quarter of the time usually occupied, and, to make the matter absolutely safe, a bolt, toothed to fit the teeth of the wheel, is dropped down upon it, which makes it perfectly immovable.

Messrs. Skinner and Co. have also placed on the market a new double dark-slide for plates or films (see figs. 3 and 4).

FIG. 3.

FIG. 4.

The back is of the solid or block pattern, with hinged shutters, and has a brass carrier (fig. 4) for holding two plates which is inserted into the base of the slide, and secured by a catch, shown in fig. 3. It is obvious that there is less danger of light penetrating to the plates, the slide is certainly no more heavy or bulky than in the ordinary book form, and there is less time and trouble taken up in inserting the plates. The price of both these novelties is reasonable, and they are likely to be widely adopted by those who practise the art. Samples can be seen at 6, Southampton Row, London, W.C.

Exhibitions.

PHOTOGRAPHIC EXHIBITION AT THE CRYSTAL PALACE.

It was scarcely to be expected that the managers of the Photographic Exhibition at the Crystal Palace could by any possibility bring this year's show up to the gigantic proportions of last year, for the occasion then was a notable one, viz., the celebration of the jubilee of photography. This year there is no Eiffel tower of photo-plate boxes soaring up to the far off crystal roof. Instead of extending the entire length of the nave, the bazaar of photographic apparatus stops short at the transept, and in the north nave there are rows of screens for some of the photographs on view. The transept opposite the big orchestra is entirely filled by a series of alcoves, some occupied by the works of well-known professional portraitists, whilst the remainder are filled by the productions of the members of the various photographic societies that have entered for the challenge cup. By the way, this challenge cup is an admirable idea, and surely will help to advance the standard of amateur photography. *Esprit de corps* must come in as a factor, and each individual member will bear in mind during his holiday tour, or in his various photographic outings, that he has the honour and prestige of his society or club to maintain. Next year probably some conditions will have to be laid down by the management, for surely it cannot be an equal competition when one of two alcoves occupied by the Newcastle Society is filled by the works of two such men as Gibson, of Hexham, and Lyd. Sawyer. The quantity and size of the pictures by these men has rendered necessary two alcoves, whilst, with one other exception, one alcove has been found amply sufficient for the productions of the other competing societies.

The fact cannot be denied that though the Crystal Palace is an admirable place for the display of apparatus, it is anything but a good one for the exhibition of photographs, and somehow, pictures that have been striking on the walls of other exhibitions have not the same force of effect, particularly in the nave. Another year it would be well to make the upper row of pictures hang over, and so avoid the reflection of the glass roof so far away, and yet so troublesome to get rid of. In the alcoves some of the pictures are very badly lighted, but full compensation is made at night, for each alcove is well illuminated by an admirable arrangement of gas.

The immense size of the building takes away the power of justly estimating the importance of the present show of photographs, and one is altogether surprised to find that there is here collected at least four times the number of photographs sent into the last exhibition at Pall Mall. The lantern display is more attractive than ever, and when it is remembered that the screen is 30 ft. in diameter, and that the lanterns are 100 ft. away, it must be admitted that lantern slides have never been seen to such an advantage before.

A selection from the slides sent in for the AMATEUR PHOTOGRAPHER Prize Competition, shown on Friday and Saturday, must surely have pleased every one of the exhibitors present; and the opinion as to the superiority of the prize winners we heard on every side endorsed the verdict of the judges, for they were undoubtedly the best of the series. The examples of portraiture in the alcoves attracted most attention, but this is not surprising; for there is a great deal of humanity about human nature, and the most flattering rendering of the human face and form divine will ever prove attractive, especially to the ladies, if we may judge by the ever-moving crowd of the fair sex invading this portion of the exhibition. One alcove has been given up entirely to the productions of lady amateurs, but a large proportion of the space is occupied by prints from the negatives of Rejlander. These have been printed and sent in by Mrs. Rejlander, and are marked not for competition. Of course an immense number of people must have seen the late display of the works of this great master at the Camera Club, but all those who had not that opportunity should not fail to see them now, for as a collection they stand, and must ever stand, unique. There are fifty of them in all, and it is impossible in such a varied series to do more than mention one or two. The old man with pen in mouth and spectacles pushed up on his forehead does not need the title "Remarkable! I have lost my pen, and now my spectacles are gone" to tell the story. That most pathetic picture "Homeless" is here,

and the bowed head of the forlorn boy conceals while it suggests his abject misery. "Jim, is it a good 'un?" is the picture of a street arab testing the genuineness of a coin with his teeth, and could not have been more real had it been done by a modern snapshot camera; and the same may be said of "Catching" and "Caught." The first is a boy with hand alert watching the progress of a fly upon a wall, and in the second one the clenched hand and triumphant face indicate clearly the finale of the tragedy. There are so many that deserve notice that space will not permit, so reluctantly we pass on. Miss Clarissa Miles has sent some charming portrait studies. "The Song" and "The Sisters" are both good, particularly the latter, a picture of two girls, very simple and unaffected in pose; but in both too much has been crowded into the background, so the success of the pictures is considerably diminished in consequence.

In Alcove B, Mr. John Pike has produced a most effective picture, which he calls "A Bit of Sixteenth Century Architecture." Only some tumble-down cottages, roofless, and weather-worn, but rugged and grand in their decay.

Mr. Lyd. Sawyer's "In the Twilight," which was so much admired at the Pall Mall Exhibition, and which gained a medal there, is so much skied that we fear many will fail to see its beauty. Mr. Pike's "Hayfield" is luminous and full of atmosphere, but has a great deal too much sky for the best effect. The ground and sky are exactly equal masses, and this is bad art.

Alcove D is occupied by the Tunbridge Wells Amateur Association, and there is some fairly good work displayed, but nothing to call for special remark, except, perhaps, the picture by the Rev. A. L. Scott, called "The Harbour," Blakeney, Norfolk. Here we have a lazy arm of the sea with motionless water, but there is no reflection of the heavy thunderous cloud overhead, and the want of harmony has spoiled an otherwise admirable picture. A series of effective portraits is shown by Mr. W. W. Winter, of Derby, in Alcove G, and they are all characterised by simplicity of treatment. The most charming is, perhaps, a group of two young ladies in white, simple in pose, and delicate in half tone. The faces are in shadow, but there is no blackness anywhere. There is an admirable portrait of Mr. Peasgood, and the picture of a smiling mother and happy baby must not be overlooked.

Alcove I is devoted to the Liverpool Amateur Photographic Association, and displays a large quantity of excellent work. "Sunny Italy," by George Thompson, is evidently the result of a summer tour, and is one of the best series in the Exhibition. They are taken with very rapid exposures, for we have the life and bustle of the market place, the movement of the gondolas on the Grand Canal at Venice, and the boiling, sulphurous clouds from the crater of Vesuvius. Cloud studies, by Daniel Cunningham, deserve notice, as also the cloud studies by J. L. Mackarell. Two pictures of hoar frost, by Paul Lange, are perhaps the most striking and artistic in this collection.

Alcove J is entirely occupied by Lafayette, of Dublin, and is most striking, for we have a series of very large panel portraits, printed in platinum, with elaborate scenic backgrounds and extensively worked up to produce the effect of Indian ink drawings. "Miss Oldham" is the portrait of lady in Greek costume, with bare sandaled feet, and is very charmingly posed. The portrait of Miss Hope is, to our mind, most effective; it is simpler in treatment, for the background is not elaborate, and the pose is most graceful. There are several portraits of Mrs. Langtry as Rosalind, in "As You Like It," and show the various costumes worn by her in that part; and the portrait of a lady in a Venetian dress with upraised hand, resting on a lofty mantelpiece, is one of the most striking of this series.

Alcove K is occupied by Van der Weyde, whose portraits are so well known they scarcely call for a remark here. In Alcove L there is a large series of pictures by members of the Birmingham Photographic Society. Mr. W. Jerome Harrison has done a delightful little picture, called "Racing down Sandhills." One child is sliding on his breast, head foremost, down a steep sandy slope, whilst others are making the journey upright, with legs half buried in the sand. The exposure must have been immensely rapid, for there is no posing—it is simply nature and nothing else, and we hope this picture will be published. "Leap-frog" is another remarkable instantaneous picture, also by Mr. Harrison. The boys are arrested in mid-air, and yet there is not the faintest indication of blurring. In both these pictures there is full exposure, for the half-tone is perfect, notwithstanding the enormous rapidity. "Gossips," by E. C. Middleton, is a perfect genre picture, and is undoubtedly the most effective one of this col-

lection. Alcove M contains the now well-known pictures of Mr. Lyd. Sawyer. The most beautiful one, however, is new to us, and is called "In the Moonlight." A dreamy quiet piece of water, overhanging trees, and two lovers in a boat, with mysterious gloom around, surely furnish materials enough for a picture. He has used them well, and has made it. The rest of the alcove is occupied by Mr. J. P. Gibson. He has sent fourteen large cloud studies, all equal in excellence. Alcove N contains a number of portraits by T. F. Goodwin, the most striking of which is a child as Red Riding Hood, and there is also a charming head of a lady, very bold in light and shade, but with perfect transparency in the shadows.

Mr. W. J. Byrne occupies Alcove O with a large selection from his well-known work; graceful women and flowing skirts abound. Two of the most striking pictures are untouched; one is an old man dozing, with newspaper in hand, and the other the Rev. Newman Hall, whose clear-cut, ascetic features, with all the lines and marks of thought faithfully rendered, is a relief after so much over-touched work. Martin Jacolette shows some good portraits in Alcove P. Miss Rose Holden is one, dressed after Gainsborough's "Duchess of Devonshire," large hat and all; but does not suggest Gainsborough's picture for all that. Miss Ritchie as Galatea is a charming portrait of a beautiful girl with soft clinging Greek drapery, and the pose is admirable. Alcove Q is occupied with strong men from the north, to wit, Gibson of Hexham; Auty and Ruddock, of Tynemouth; and Gould, of Elswick, Newcastle-on-Tyne. We will begin with the last-named first, for he shows a most remarkable picture of H.M.S. *Victoria* firing a broadside. It is many years since another strong man from the far north, Wilson, of Aberdeen, astonished the world with Nelson's old *Victory* firing a salute in Portsmouth harbour; this was in the days of wet photography, full thirty years ago. This feat has been performed indifferently well many a time since, but never so well as in the one now under notice. There is the belching spirit of "villainous saltpetre" from the iron muzzle from the ship's iron sides, and the twisting, coiling, sulphurous steam seems solid enough to stand on. We cannot say more; let the reader go and see it. There are several others nearly as good but not quite. Auty and Ruddock send several of their well-known pictures, but two, new to us, must be mentioned. A stranded ship in the gloaming, and lazy waves lurch in upon the sandy shore, and show a preternatural whiteness against the murky sky. "Wrecked" is another, similar in treatment, but the ship is half buried in foaming water. Most of Gibson's pictures have been exhibited before. "Autumn Haze" is a very beautiful landscape. In Alcove R, devoted to the work of the Peckham Society, there is a very remarkable view of the Tower of London, taken from some high point on Tower Hill, by F. W. Edwards, for it looks on to the platforms of the various outer towers, and shows the busy Thames beyond. It is taken direct, although it measures some 24 by 12 ins. Mr. Edwards must be commended for his taste in cutting away so many inches of uninteresting foreground, and thus giving proper importance to the grand old building.

In Alcove Q, Messrs. Green Bros. exhibit a considerable number of their large lake pictures, but most of them are so well known, and have been so frequently noticed, that they do not call for further remark, except to say they are superlative.

Passing to the screens, of which there are thirty-two (excluding those occupied by the "Prize Tour Competition" pictures), we find much admirable work. On Screen 1 two frames of "At Home" portraits by Mr. Fred. H. Evans (793 and 801) are well worthy of study as examples of what good work can do in an ordinary sitting-room. A photograph of a lady, another "At Home" portrait, by Mr. Butler (784), would be much improved by judicious trimming; there is too much space "to let." No. 800, a well rendered head by Mr. Balfour, deserves more careful mounting. Mr. Bright sends some pleasing enlargements from hand-camera studies of child life, 807 and 809. We should much like to see lantern slides from these shown on a large screen. The same remarks apply to Nos. 874 and 875, by the same gentleman. Nos. 814 and 815 are two very charming studies by Mr. Austin. Our readers will recognise 814 as the supplement to the last QUARTERLY. They are masterly examples both of technique and artistic feeling. Some of the studies by Mr. Stieglitz (835 and 838) will also be recognised as having been reproduced by us, No. 836 "A Good Joke," we think the best of the series. No. 862, a frame of three Thames studies below bridges, by Mr. T. Bright, in every way deserve the recognition they have received at the

judges' hands. They are some of the finest marine pictures we have ever seen, and we must congratulate Mr. Bright on his artistic and technical success. They should be carefully studied by all who desire to excel in work of this kind. Mr. Martin J. Harding's Pocket-camera Studies (870 and 1,037) also deserve careful examination; they show conclusively that artistic results can be produced as well by a $3\frac{1}{4}$ square camera as by a 15 by 12, if used with the necessary care and knowledge. "Tugging Out Against the Tide," by Rev. J. C. Lambert (878), is an artistic rendering of a pleasing subject, but would, we fancy, be better taken the long way of the plate, for the amount of both sky and water could be reduced with distinct advantage. For the Oxford interiors by Mr. Court Cole, we have nothing but praise. They are small but admirable examples of interior work. Mr. Muncey also shows on the same screen two good interiors, Nos. 897 and 898. Messrs. Bemrose and Sons' fine exhibition of mechanical prints, Nos. 916 to 926, should be examined by all interested in process work. Screen 9 is covered with pictures by Mr. A. Horsley Hinton (927 to 947); although somewhat uneven in merit, they show much artistic feeling and deserve notice. Screen 10 (948 to 969) is filled with twenty-two superb platinotypes of architectural subjects, entitled "A Monograph of Old Moreton Hall, Cheshire." To say that they are in every way worthy of their exhibitor, the veteran Mr. Richard Keene, of Derby, is to give them the highest praise in our power. Messrs. Gunn and Stuart's exhibit of portraiture on Screen 11 (970 to 974) comprises some fine examples of professional studio work. We like the direct prints better than the enlargements; the style of framing, too, might be improved by greater simplicity. Mr. Gambier Bolton is represented on Screen 12 (975 to 993) by some of his well-known animal studies. They are all quite up to Mr. Bolton's high standard. Mr. Scotton, of Derby, on Screen 13, (Nos. 994 to 999) shows some very fine photographs of engineers' workshops; they are of large size, and splendidly printed in platinotype, while 1,001, a platinotype of a drawing showing the general arrangement of a locomotive engine, is a most noteworthy example of the immense use of photography in the arts and manufactures. The whole exhibit is deserving of the highest commendation. Screens 15 and 18 are filled with very large pictures of the Canadian Pacific Railway; they are apparently bromide enlargements very much worked up both with black, white, and colour, but apart from their topographical interest call for no remark. Mr. Alfred Stieglitz exhibits on Screen 19 some well-intentioned studies (1,018 to 1,023); they show evidences of an art feeling which is none too common amongst photographers. No. 1,023 just misses being a picture; the large white patch formed by the handkerchief greatly detracts from the merit of an otherwise admirable study. Here we find three more pictures by Mr. Austin (1,029 to 1,031). Of these we like 1,029 "A Letter from Ben," the best. The posing, especially of the girl on the left, is very good. No. 1,031 is rather spoilt by the fence in the foreground. As usual with Mr. Austin's work, the technique leaves nothing to be desired. Dacoit hunting scenes in Burmah, by Surgeon Newland (1,035), are extremely interesting, not only for their own sakes, but as examples of the value of photographic records of facts made under the most difficult and exciting circumstances. A series of pictures by the Rev. J. C. Lambert (1,038 to 1,046) are worthy of more than passing notice; they are evidences of this gentleman's well-known love for art. Mr. Lambert exhibits also some examples of an old photographic dodge, in which the same sitter is taken two or three times on one plate. The photo-micrographs of Mr. A. Carnell (1,059 and 1,060) should be examined by all interested in the microscope. Photographs of this kind, especially where, as in these cases, the technique is good, must possess much scientific value, although perhaps they may be "caviare to the general," and the recognition of their usefulness by the medical profession will doubtless lead to a greatly increased number of workers in this study, which Mr. Andrew Pringle has made so particularly his own. On Screen 22, No. 1,079, a view near Odiham, by Mr. Muncey, would look much better in platinum, while Mr. J. W. Green's exhibit, "Views on the Seam," etc., although admirable in execution, have much to be desired from an artistic standpoint; the shadows are far too heavy. The same fault of too heavy shadows is also observable in a view of Matlock Bath by Mr. J. G. Pierpoint (No. 1,101). We find on this screen, 23, some more of Mr. T. E. Austin's admirable work (1,107 to 1,111); and of these we like "Cooling Waters," 1,108, and "By the Tow Path" (1,111) the best. The

commendatory remarks made on Mr. Austin's exhibits, noticed above, apply with equal force to these five pictures. No. 1,129, by Messrs. Perrett and Mayhew, enjoys the distinction of being, in our opinion, the very worst photograph in the exhibition; it is full of faults, the point of view is wrongly chosen, there is absolutely no artistic feeling, and the technique is bad. It would have been the truest kindness to the exhibitors to have excluded it. No. 1,131, "Carshalton Ponds, Surrey," by Mr. Bruce, are pleasing pictures of a pretty place. Mr. Lambert's "Whitby, Yorks" (1,138), wants a stronger sky. On Screen 25 we see some of Mr. Coll's admirable reproductions (1,139, 1,140, and 1,147) together with Mr. Lord's ambitious "Try Again" (1,143). This last, although well conceived and well executed, just misses the excellence of "Neddy's New Shoes," exhibited by the same gentleman a few years ago. We like "A Tale of the World," by Mr. J. Whaley (1,146), very much; the attitude and expression of the little boy, and pose of the narrator tell a story, and the picture needs no poetic quotation to explain it. Two pictures with the same name, "The Student" (1,144, 1,145), show Mr. Andrew Pringle's ability as a photographer of figure studies, and will be examined with interest by the numberless photographers to whom that gentleman's name is a household word. Photographs of the "Great Strike," by Mr. Nisbett (1,148 to 1,150) are good examples of instantaneous street work. On Screen 28 is found Mr. F. M. Sutcliffe's "Excitement" (1,164). Like all Mr. Sutcliffe's pictures, it is admirable. No. 1,166, another of his, is a flashlight picture of the Marchioness of Abergavenny's Court Lancers, and though a large picture, it is fully exposed, for both lights and shadows are delicate. Mr. R. Faulkner well maintains his high reputation by his exhibit on Screen 29. His studies of children, 1,169, are up to his usual high standard, while frame No. 1,170 contains three portrait studies, which, although small, are some of the most artistic examples of portrait photography we have seen. Mr. Symonds, on Screen 30, shows some of his famous yachting pictures (1,176). Like all his exhibits, they are splendid examples of marine photography. Messrs. Scott and Co.'s portrait of a lady (1,177) is another noteworthy example of the perfection to which portraiture has been brought by skilled professionals. An improvement in proportion might perhaps be made by trimming the lower edge of the print, so as to show less of the lady's dress, but it is a charming picture of a charming subject. Mr. Gambier Bolton has an enlargement of one of his famous lion studies (1,175), which does full justice to the original negative, a print from which is shown on Screen 12. On Screen 31, notice should be taken of Mr. Lord's "Dogs" (1,178) and Messrs. Frith's "Landscapes" (1,182). These last, although admirable, are mounted in optical contact with glass, a method of which we cannot approve. Two interiors by Mr. Reeve (1,179 and 1,186) are very fine examples of their kind, soft and delicate; they should not be passed by. No. 1,189, "Venice," by Mr. Wilson, is an artistic effect, due more to the paint brush than the camera; it is admirable work, but not photography. A very charming landscape by Mr. G. H. Catt, entitled "The Moated Grange" (1,225), is to be found on Screen 32. It surely deserves a cleaner mount and unbroken glass. Among the pictures entered for the Prize Tour Competition, those by the Rev. W. Mann are by far the best. The old picturesque streets in picturesque old Brittany towns have never been so well rendered before. From an artistic point of view three or four of them are absolutely perfect. There are also some admirable Norwegian scenes by Herbert E. Allen.

The exhibition, on the whole, is a very fine one. It, however, is so vast, and the number of pictures shown so large, that we have been compelled by exigencies of space to omit criticism on many frames worthy of more than passing notice, while many examples of bad photography which require condemnation have been passed over in silence from the same cause. We might mention 1,099, "The Keeper's Revenge," an inartistic photograph of an unsportsmanlike act, rendered the more objectionable by an utterly unsuitable oval mount. Again, on Screen 2, we find three bromide enlargements (Nos. 804-6) which we say unhesitatingly should not have been admitted. They show neither artistic feeling nor manipulative skill; in addition, No. 804 is printed from the wrong side of the negative. We have picked these out at random, but there are many examples of equally bad photography which we have no space to mention. We give it as our deliberate opinion, after a lengthened and most careful examination of the Exhibition, that the cultivation of artistic taste amongst photographers, both amateur and pro-

essional, is on the increase, and, notwithstanding the examples of bad work we have referred to, we are rejoiced to see a very much higher average all round than at last year's Exhibition. We sincerely hope that next year will show an improvement even greater, as it is only by the careful art study of its votaries that the reproaches which artists level against photography can be removed.

AWARD OF PRIZES.

Gold Medal for Best Alcove.

Lafayette (Dublin).

Club Challenge Cup.

The Birmingham Photographic Society.

Open to Professional and Amateur Photographers.

Class A, Sec. 1.—Green Bros, Grasmere. Special Award for Alcove.

" " 1.—Auty and Ruddock, Tynemouth, for 560 and series.

" " 2.—Lyd. Sawyer, Newcastle, for 469.

" " 3.—Richard Keene, Derby, for 948 and series.

" " 3.—Henry W. Reeve, for 1,186 and 1179.

" " 5.—James E. Goold, Newcastle-on-Tyne, for 568.

" " 5.—Symonds and Co., Portsmouth, for 1,176.

" " 7.—Gambier Bolton, Camera Club, for Screen 12.

" " 8.—J. Pattison Gibson, Hexham, for 470 and series.

Class B, Sec. 1.—W. W. Winter, Derby, for 199.

" " 1.—R. Faulkner, Baker Street, Portman Square, W., for 1,170.

" " 1.—B. Scott and Co., Carlisle, for 1,177.

" " 1.—T. F. Goodwin, 63, Anerley Road, S.E., for 483 and series.

" " 2.—W. J. Byrne, Richmond, for 517.

" " 6.—F. W. Edwards, Peckham Rye, S.E., for 616.

Class C, Sec. 1.—Frank Sutcliffe, Whitby, for 1,164.

" " 1.—R. H. Lord, Cambridge, for 1,143.

" " 3.—Arthur H. Carnell, Plymouth, for 1,057.

" " 7.—Walter L. Colls, Barnes, for 1,139.

" " 8.—Thomas Scotton, Derby, for 1,001.

" " 9.—H. J. Godbold, St. Leonards-on-Sea, for 1,166.

General.—George Thompson, Liverpool, for 222.

Open to Amateurs only.

Lady Amateur Class (Silver Medal).—Miss Clarisse Miles, Malmesbury, for 80, 81, and 82.

Class AA, Sec. 1.—G. H. Catt, Spettisbury, Dorset, for 1,225.

" " 3.—Court Cole, Folly Bridge, Oxford, for 891 and 892.

" " 3.—Rev. W. Man, M.A., S.C.L. (AMATEUR PHOTOGRAPHER "Prize Tour Competition"), Bristol, for 1,322.

" " 5.—Martin J. Harding, Shrewsbury, for 870.

" " 5.—T. J. Bright, Gipsy Hill, for 862.

" " 5.—Surgeon A. G. Newland, I.M.S., for 1,035. (For photographs taken under great difficulty.)

" " 8.—J. L. Mackrell, Fairfield, Liverpool, for 256 and 257.

Class AB, Sec. 2.—J. E. Austin, West Court, Detling, Maidstone, for 814 and 815.

Class AC, Sec. 1.—E. C. Middleton, Birmingham, for 414.

General.—W. Jerome Harrison, Birmingham, 401 to 406.

The Judges also recommend that a complimentary Medal be awarded to Mrs. Rejlander for the exhibit of her late husband's art studies.

Judges.—Messrs. Frank Atkinson, Valentine Blanchard, George Brittain, Wm. Brooks, F. Mason Good, Chas. Hussey, Paul Lange, E. M. Nelson, Wilson Noble, Andrew Pringle, and Sir David Salomons, Bart.

Executive.—Messrs. S. G. Buchanan Wollaston and J. Francis Peasgood.

APPARATUS.

If proof were needed of the still growing usefulness and popularity of photography amongst all classes of the community, a visit to the exhibition of photographs and photographic appliances now on view at the Crystal Palace would be sufficient to convince the most sceptical. Taken as a whole, the present show, so far as its pictorial element is concerned, may be regarded as the largest, most comprehensive, and most varied that has yet

been held. Varied it most assuredly is, for whilst there are many examples, not only perfect in their technique, but charming embodiments of the most refined sentiment and poetic feeling, stamping their authors at once as artists of no mean order, it is none the less true that there are scores which ought never to have found a place in any exhibition, unless placed as monitors or beacons, and each one bearing the appropriate label of "How not to do it." It is disappointing and much to be regretted that, as report says stereoscopic photography is being gradually resuscitated, not a single slide is to be seen in all the exhibition. This really beautiful and fascinating branch of our art ought not to be allowed to lie dormant. There are at the present moment thousands who are practically connected with photography and yet have never seen a stereoscopic picture. One can readily imagine that a rage similar to that which existed twenty-five or thirty years ago would soon set in if they were only fairly and systematically introduced again to the public. It is to be hoped, therefore, that those who have taken the subject in hand will work on with renewed energy until they see that in the matter of stereoscopic photography history is repeating itself. Might not the executive of the Exhibition take a timely hint for their next display, and offer a special prize for the best series of stereo slides?

The idea is surely worth some consideration. The lantern show is again, as on former occasions, under the able management of Mr. William Brooks, of Reigate, and forms a prominent feature in the proceedings. A free demonstration is given every evening in the lecture hall, at 6.30, when a pair of very fine lenses, made specially for Mr. Brooks by the firm of Taylor, Taylor, and Hobson, of Leicester, are brought into requisition. These lenses have been christened "the Crystal Palace twins," and to the great delight of those who attend the dark séances, right splendidly they perform their work.

Compared with former years, it is quite impossible to regard the apparatus part of the show as an unqualified success; and this fact provides material for very serious reflection. It has been known for some time past that a hostile attitude had been taken against the movement by several of the principal London manufacturers and dealers, which necessarily hampered the movements of the executive, and now the fact is rendered the more conspicuous by their entire absence on the present occasion. Those firms, however, which, proof against intimidation, gladly responded to the invitation sent them, consider their action as a fortunate circumstance, and believe that their relative positions meet with an apt illustration in the well-known fable of the hare and tortoise. It is a great pity that, in matters of this kind especially, the spirit of enterprise, so laudable in itself, should be so freely diluted by petty jealousies as to not only militate against their success for the time being, but also render their ultimate collapse probable. Let this cap be tried on and worn by any and all whom it may fit.

First in order in the apparatus division come the well-known firm of Watson and Sons, who are the occupiers of the first block. Their exhibits, although not so extensive perhaps as on former occasions, comprise a really splendid assortment of cameras and stands, varying in size from the mammoth studio set down to the less pretentious and unobtrusive hand-camera, all of the highest possible class of workmanship and design. The "Premier" camera is a piece of good workmanship, and both it and the "Acme" are admirably calculated to cause any amateur to break the tenth commandment with all his heart. By the way, how satisfactory it is to find that most objectionable phrase "detective camera" giving place to "hand camera," an alteration first suggested by Mr. Cambrano. The firm of Watson and Sons have recently pressed aluminium metal into their service, and are now using it for the fittings of their cameras. This very considerably reduces the weight of the instruments, which, when rigidity is not sacrificed by such reduction, is obviously of great advantage, more especially when field work is contemplated. A new form of hand-camera is also exhibited by them, the invention of Mr. Van Neck, of Antwerp, who is one of the principal photographic dealers in Belgium; the leading point of interest in this particular camera is that one is able to see the picture upon the focussing-screen up to the very instant of exposure.

The next block in order is that occupied by Mr. Stanley, a name not easily forgotten, seeing that it has become popularised all over the world, and whoever purchases any piece of apparatus at 13, Railway Approach, London Bridge, takes it for granted he

has secured a good article, and is never disappointed. A striking exhibit at this stand, and a most tempting bait, is a really magnificent camera and stand, of Brobdignagian proportions, and of the choicest workmanship, and now that the demand for large direct portraiture is becoming so general, this attractive piece of apparatus will doubtless prove a real temptation to many an enthusiastic aspirant for fame in that direction.

We next come to the various exhibits of Messrs. Beck, of Cornhill, amongst which are included two real stereoscopes in a glass case. This is at least suggestive. May we not hope that next year their exhibit will contain two stereo cameras?

(To be continued.)

Societies' Meetings.

NOTE.—In this column the Editors can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editors will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

BRADFORD PHOT. SOC.: The usual monthly meeting was held on Tuesday evening, March 11th, when the President, Mr. Alex. Keighley, opened a discussion on "The Art Principles of Dr. P. H. Emerson." The discussion was a most interesting one, and was taken part in by the following members: Messrs. D. G. Law, W. H. Scott, H. Forsyth, W. Wilkinson, W. Leach, and G. Firth. The arrangements were made for the fifth annual exhibition of members' photographs, and several alterations made in the class lists. At the next meeting of the society on April 8th, Mr. Walter Leach will read a paper on "Enlarging, Copying, and Reducing, with especial reference to Lantern Slide Making."

BRIGHTON PHOT. SOC.:—A meeting was held on the 11th inst. The evening being a lantern night, a splendid selection of slides, numbering about 180, were passed through the lantern, kindly lent and worked by Mr. Ford. The slides were contributed by Messrs. S. Fry and Co., the proprietors of the AMATEUR PHOTOGRAPHER, the Britannia Works Co., and Messrs. S. B. Hardcastle, J. G. Potter, G. Constable, and P. Morris. The slides on the new Alpha plates were much admired for their beauty and wide range of colour. The architectural subjects by Mr. Morris also elicited warm commendation.

BRIXTON AND CLAPHAM CAMERA CLUB.—The meeting on Friday the 14th inst. was mainly one for discussion of business. Two members were added to the roll. Mr. T. J. Bartrop afterwards read a few notes on "Enlarging on Bromide Paper by Daylight." On the 28th inst. will be held the annual general meeting.

DEWSBURY AM. PHOT. SOC.:—The monthly meeting was held on the 13th inst. Mr. T. G. Beaumont, President, in the chair. The Secretary, Mr. G. Kilburn, gave a paper on hints on "Lantern Slide Making." He first treated on commercial gelatine plates, showing specimens made on Fry's plates for cold tones, and recommended these plates as suitable for either contact printing or reduction in the camera. Plates suitable for slides in warm tones were Thomas's, "Alpha," etc. Slides made by the carbon process were next shown, and a general method of working by this process was given. A communication from the Autotype Company was read, stating that they were making a series of experiments, with the object of placing upon the market a tissue specially for transparency work. A résumé of the colloidal emulsion process was given, together with specimen of work. A number of slides by the wet-plate process were shown. March 25th, "Complimentary Social Evening." April 10th, "Hand Cameras," monthly meeting.

HOLBORN CAMERA CLUB.—On the 14th inst. a lecture and demonstration on "Enlarging from Small Negatives" was given by Mr. H. S. Fry, who secured some very successful 17 by 23 enlargements on bromide paper, using an ordinary Optimus lantern, fitted with the oxygen light, and provided with a green baize curtain 3 ft. by 4 ft., with small aperture in centre, through which lens of lantern was put. After making a very successful vignettéd portrait, a landscape was exposed, the sky being masked; the print was then developed, and developer washed off, and the print then exposed again for the clouds, which were

developed by the local application of developer with a pad of cotton wool. For enlargements a lantern cap of yellow glass is a great help, as by its means one can see exactly where to place the paper. To-night (Friday), beginners' night; instruction will be given in development of gelatine plates by Mr. J. E. Smith, silver printing and toning by Mr. E. H. Bayston, platinotype printing by Mr. F. Brocas, and bromide printing by Mr. T. O. Dear.

LANCASTER PHOT. SOC.:—On Tuesday, March 11th (being the last meeting of the session), a lantern night was held, visitors being invited. The company, numbering about 50, had the opportunity of viewing about 130 slides, one-third of which were lent by the Editor of the AMATEUR PHOTOGRAPHER, the rest being the work of members and friends. The pictures thrown on the screen by Mr. J. W. Pickard's lantern drew from the audience frequent signs of admiration and approval. The next meeting, April 3rd, is the general annual meeting of the Society, and commences a new year. The Secretary will be pleased to hear from any gentlemen in the district who would like to join the Society. Seven gentlemen await election at the next meeting.

LEICESTER AND LEICESTERSHIRE PHOT. SOC.:—A regular meeting of the Society was held on the 12th inst., Mr. S. S. Partridge, President in the chair. The silver and bronze medals were presented to the successful competitors in the lantern slide competition, Mr. Porritt and Joliffe respectively. On the motion of the President, Mr. Thomas Scotton, Derby, was elected hon. member of the Society. The competition for silver and bronze medals for enlargements offered by Mr. F. Pierpoint was declared void in consequence of the number of entries not complying with the conditions. The competition was postponed until the October meeting. The medals are offered on condition that not less than three compete for the silver, and five for the silver and bronze medals.

LOUTH AND DISTRICT PHOT. SOC.:—A meeting of the members of this Society was held on the 10th inst., at the residence of Mr. S. F. Clarke, Ugate, for the purpose of electing officers and other matters. The first business was the election of officers, and this was at once proceeded with, the following being the result:—President, the Rev. C. W. Whistler; Hon. Sec., Mr. S. F. Clarke; Committee, Captain Ranshaw, Rev. J. M. Coates, Messrs. C. James and Jno. East; Hon. Treasurer, Mr. E. Hall. Mr. Hall announced that Mr. Clarke would, at the next meeting to be held in the evening of April 14th, have ready for signature the members' book, and the subscriptions would be due. The date of the first excursion was left open. Mr. Clarence James exhibited a specimen of a new celluloid film negative.

NEWCASTLE (STAFFS) AND DISTRICT AM. PHOT. SOC.:—At a meeting held in the Library on Wednesday, March 12th, Mr. Henderson's resignation of his post of Secretary was read and accepted. The following gentlemen were elected as joint Hon. Secs., Messrs. W. Wilberforce Beach, and J. D. Illidge; and as they were members of the Council, Messrs. S. M. Copeland and H. E. Emery were elected members of Council in their places. A paper on "Flash-Light," contributed by Mr. E. Best, was read by Mr. Illidge.

NEWCASTLE-ON-TYNE AND NORTHERN COUNTIES PHOT. ASSOC.:—The ordinary monthly meeting was held in the Mosley Street Café, Newcastle, on Tuesday, the 11th inst., Mr. J. P. Gibson in the chair. Three new members were elected. The Hon. Secretary (Mr. Edgar G. Lee) announced that arrangements had been made so that each member would receive a free pass to admit all the time to the Photographic Exhibition in the Art Gallery, Newcastle, which opens on the 18th inst. The evening was devoted to a discussion on "Stereoscopic Photography," and an exhibition of slides. The AMATEUR PHOTOGRAPHER Competition, "Stereoscopic Slides and Enlargements," were also on view.

NORTH MIDDLESSEX PHOT. CLUB.—On Monday next, March 24th, Mr. Smith will give a lecture on "Micro-Photography," and illustrate it by means of the optical lantern. Visitors are invited to attend.

PHOTO. SOC. OF IRELAND.—An ordinary meeting of this Society was held at the rooms, 15, Dawson Street, Dublin, on Friday, the 14th inst., at 8 p.m., Mr. Greenwood Pim in the chair. Four new members having been elected, the Chairman called on Mr. Louis Meldon to read his paper on "Shutters." Mr. Meldon began by saying that he would not endeavour to travel right through the subject, but would rather confine himself

to a few points, and extend his observations to instantaneous work and the lenses most suitable. Having explained the working of the Wilson chronograph, which he used as his timing apparatus, he went on to say that shutters might best be classified relatively to the position they occupy when used with the ordinary form of doublet lens: (1) on the hood of the lens; (2) between the two combinations; (3) immediately behind the lens; (4) immediately in front of the plate. The fourth class he intended at once to dismiss, for although its position was in many respects the most favourable of all, the advantages were much outbalanced by the inconvenience due to the large size of the apparatus needed. An ideal shutter, he said, was one which, if it were possible, would open to its full aperture suddenly and without lapse of time, and having remained open a certain time would close suddenly again. Mr. Meldon having dealt with most of the instantaneous shutters in general use amongst photographers, proceeded to describe his own, and passed through the lantern some admirable specimens of its work, including his celebrated "Diver." The members present having discussed the paper, the proceedings were brought to a close by a hearty vote of thanks to Mr. Meldon.

ROTHERHAM AM: PHOT: SOC:—The monthly meeting was held on the 5th inst., Dr. Baldwin, President, in the chair. Mr. Firth gave a short paper on "Exposures," dealing chiefly with the difficulties in using exposure tables, and advocating long exposures with slow and careful development, giving also his personal experience in exposure and development. The next monthly meeting is to be a lantern night, when the Britannia Company's prize lantern slides will be thrown on the screen by the powerful triple oxy-hydrogen lantern.

SPEN VALLEY PHOT: SOC:—The first ordinary meeting was held on Tuesday, the 11th inst., the President (Dr. Farrow) in the chair. After some introductory remarks of a general character, the Hon. Sec. (Mr. W. H. Wright) read his report, which showed the Society to be in a very promising condition, and that the dark-room, with appliances for enlarging, etc., was ready for the use of members, and that a fair nucleus of a library has been formed by the gift of books and papers by several members of the Society. The question box was opened and the contents discussed, after which the President read a paper entitled "The Scientific Basis of Photography," being a very able and clever treatise with numerous illustrations. At the conclusion of the meeting the members inspected the dark-room and its appliances, with which they expressed themselves highly gratified.

WEST LONDON PHOT: SOC:—An ordinary meeting was held on the 14th March, Mr. E. W. Foxlee in the chair. Mr. Henry Selby read a paper and gave a demonstration on "Eastman Stripping Films." The lecturer said stripping films in the hands of careful workers presented few difficulties and were undoubtedly superior to glass in the matter of portability, storage, and immunity from damage if dropped. He seldom dealt with more than two films at a time. The great point was not to leave the films more than ten minutes in washing water after development and fixing; after that time he placed them in acid bath composed of acetic acid, 10 minims, water, 10 ozs., in which they were left all night. Films so treated always stripped without trouble. His mode of working differed from that recommended by the Company in the following particulars. He did not strip the same evening as he developed; he never used rubber solution; he did not place the film on glass support under water, it being easy to avoid bubbles without so doing; never used glycerine and alcohol, and did not varnish the gelatine skin. Mr. Selby then proceeded to give a practical demonstration of the process. An interesting discussion ensued.

WEST SURREY AM: PHOT: SOC:—At the meeting on the 12th inst., at Crichton Hall, Clapham Junction, the subject was "Landscape Work, and the Picturesque Therein," by Mr. W. Winsford. The lecturer, defining the mission of a true picture to be to awaken the highest feelings of the mind, as well as show the excellence of its technique, said that in landscape work this could be best done. The production of good pictures depended especially on the cultivation of taste in choice of subject, time, and light, surroundings and perspective. In addition to these, certain rules of art must be applied, viz., the proper amount and distribution of light and shade, contrast in tones and forms, and above all, the introduction of a human interest, so that our work should not appear merely pictures of an empty world. Illustrations of the various points were given by descriptions of scenes with which all were more or less familiar, and by

remarks on the composition of well-known pictures. The paper also showed where figures could be best introduced to secure contrast and relief, and concluded by an appeal to members not to degrade the camera into being simply the means of producing "mere bits," urging that breadth of subject largely conduced to effective pictures and tended to elevate and influence the mind. On the evenings of the 26th, 27th, and 28th inst. there will be an exhibition of photographs and lantern slides. The Editor of the AMATEUR PHOTOGRAPHER will be present on the evening of the 28th, and will provide lantern slides for one of the shows.

WINDSOR AND ETON PHOT: SOC:—At a meeting held on the 13th inst., Mr. A. Moyse in the chair, a paper was read by Mr. A. Glass, member, on "Enlarging." The author terminated his interesting paper by a demonstration of the development of an enlargement. The acting Hon. Sec. then explained to the meeting the proposed coalition with the Scientific Society, and it was proposed by Mr. Hollett, and seconded by Mr. A. F. Moore, and resolved that "The members of the Photographic Society approve of the proposed coalition of this Society with the Scientific Society, and that the details be arranged by the Committees of the two Societies." This was carried *nem. con.*

WORCESTER CAMERA CLUB:—On Thursday evening last a meeting of Worcester gentlemen interested in amateur photography was held at the head-quarters of the Worcester rifle volunteers, St. Nicholas Street, Major Webb presiding. A number of gentlemen regretted they were unable to attend. The Chairman, after remarking upon the advantages and pleasure the members were likely to derive from practising the art of photography, moved the following resolution, which was seconded by Mr. J. Cam:—"That it is desirable to form an amateur photographic society for Worcester." It was then proposed by Mr. W. A. Firkins, and seconded by Mr. E. Jones, that the following be elected a Committee to draw up rules and take steps towards the formation of a club, and report to a meeting to be held on March 27th: Committee, Major A. Webb, Messrs. J. Cam, C. Dutton, T. B. Judson, F. G. Jones, and W. H. Cam. Mr. T. James kindly consented to act as Hon. Secretary *pro tem.* A hearty vote of thanks was then accorded to Major Webb for presiding, which brought the meeting to a close.

NOTE:—The following reports received too late for insertion:—Wallasey (5th), Hackney (13th), North Middlesex (15th),

MESSRS. HINTON AND Co.'s new catalogue is to hand. It contains all the necessary apparatus and material for the purposes of photography at a reasonable price, the purity of the chemicals being guaranteed.

NEWCASTLE (STAFFS.) AND DISTRICT AM: PHOT: SOC:—We are asked to state that the Hon. Secretaries of this Society are: Mr. W. Wilberforce Beach, West Brampton, Newcastle, Staffs.; and Mr. J. D. Illidge, Earl Street, Newcastle, Staffs.

PHOTOGRAPHING NATURAL COLOURS:—The following has been received from Vienna:—Dr. Eder, Professor of the Photographic Institute of Vienna, has announced that a photographer named Veresch, living in Klausenburg, Transylvania, has succeeded in solving the problem of photographing in natural colours. Up to the present, only the shades between deep red and orange can be retained, and even these, if exposed to the light, fade in from two to three days; but the experiments are being continued, with good prospects of complete success.

WASHING PRINTS:—Mr. L. Stanway, of Cauldon Road, Hanley, is a most ingenious inventor, and gave us a call last Tuesday, showing us many things. Our attention was particularly called to a novel arrangement for washing prints. In most print-washers the prints are subject to a sort of perpetual motion, oftentimes resulting in torn prints and consequent loss of time and money. Mr. Stanway has made a series of frames in which prints, say from 12 by 10 to $\frac{1}{4}$ plate, are laid on an open screen of strong twine, another screen placed on the top—the face of the prints by a simple contrivance being kept off the screen—and so on. These are placed upright in the washer, the water of course having access to the whole surface of the print, therefore not coming in contact with the bottom of the vessel at all. The screens are also made for the zinc plate-racks now so frequently supplied with washers. These latter are very simple and very cheap; they are eminently suitable for the amateur, as by their use prints can be washed with as much ease as plates.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S** post.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3574. **Ilford Plates in Paris.**—Will any amateur kindly tell me where the Ilford plates can be obtained in Paris?—S. WILTSHIRE.

3577. **Insoluble Gelatine.**—Can any reader give me a reliable method of preparing gelatine, so that it is insoluble in acids or water after exposure to light? I wish to coat a piece of glass with a thickish solution of gelatine, expose it under a negative, and wash away the protected parts.—O. JEFFREYS.

3578. **Holiday in South Devon.**—My holiday of a fortnight commences on April 12th, and I am desirous of spending the same in South Devon. Would any brother amateur who has spent a holiday there give me his assistance as to best place for centre of operations, a good inexpensive hotel or boarding house, and his general experiences?—HOBBY.

3579. **Removing Stains from Steel Engravings.**—I wish to copy some steel engravings, but, unfortunately, they have some long yellow stains across them, through defective frames. How can I remove the stains without injury?—C. S.

3580. **Italy.**—I am making a trip to Italy this Easter, and wish to take photographs. What developer would be best to take? And what plates is it best to use with the recommended developer?—POOR CHINEE.

3581. **Metal Slides.**—Will some amateur give me his opinion of Tylar's metal slides? Kindly mention faults, if there are any; and can they be bought separately?—POOR CHINEE.

3582. **Metal Dark Slides.**—Will any brother amateur tell me if I can use these slides in one of Lancaster's half-plate 1889 Instantographs?—NIT-SUA.

3583. **Magnesium Flash-Light.**—What is the cause of the smoke that arises when the powder is blown through a flame? I find that no smoke is made when the powder is projected by a spring, as in Vever's pistol. Is it the mixture of air with the powder, or does the air, being colder, prevent the perfect combustion of the powder?—O. F. S.

3584. **Ilford Formula.**—Will any brother give me the Ilford pyro formula in 10 per cent. solutions, and quantity to use for developing?—J. J. B.

3585. **Alexandrian Blue.**—I am engaged in experiment on fresco work, and should be delighted to be able to obtain so fine a colour, or, failing this, the proportion of silicate of copper and of lime, and the proportions and manner of making.—WILLIAM FOUNTISS.

3586. **Wide Angle Lens.**—I want to buy a wide-angle lens. Which is best, an Optimus or Wray's? I have bought an Optimus R.R., and like it very much. Should like opinion on either of above.—J. J. B.

3587. **Burnisher.**—I have a $\frac{1}{2}$ in. Vever's burnisher; when I put my prints through, it lifts the print from the card. Have tried different heats, and have used gelatine mountant and starch, but to no use. Will any brother amateur tell me how to use his burnisher?—J. J. B.

3588. **Aristotype.**—Will any brother amateur tell me the best way to mount aristotype so as not to use the gloss? Shall be much obliged for any hints on above.—J. J. B.

3589. **Gaslight.**—Can photographs be taken in gaslight?—PHOTO.

3590. **Sensitised Paper.**—Can you please tell me why the sensitised paper turns yellow sometimes

after it has been in the toning bath?—SENSITISED PAPER.

3591. **Chloride of Gold.**—Can you please tell me how to get chloride of gold from old toning baths?—CHLORIDE OF GOLD.

3592. **St. Heliers, Jersey.**—Can any one please inform me if I can get the use of a dark-room for changing plates, etc.? Also if plates and necessary chemicals can be procured there?—B. B.

3593. **Gelatine Mountant.**—Will any one kindly inform me how to make a gelatine mountant that will not require melting down before use? and that will also not affect the gloss of Aristotype prints, similar to the one manufactured by Messrs. George Houghton and Sons?—E. J. TAPSON.

3594. **Dark-Room.**—Will any reader give me particulars how to make a cheap dark-room and the probable cost of one? All remarks will be gratefully received by MARIE DE MEUDON.

3595. **Gelatine.**—Is there any method by which gelatine can be made insoluble, plastic, and perfectly non-poisonous?—NIGER.

3596. **Focus.**—Will Mr. Geo. Ra'hone kindly say if he finds that by "taking out the back combination of a portrait lens and separating the components" the focus is shortened? Also in what position are the back lenses; is the convex back lens still next the ground-glass?—MEROI.

3597. **Hand-Camera.**—Kindly say which is best hand-camera for use with roll-holder films?—MEROI.

3598. **Photography in Germany.**—Is there any difficulty in getting camera and s x or eight dozen half-plates through the custom-houses in Germany and Bavaria? Can Ilford or other English half-plates be got in Munich? Is there any restriction to photography on the Rhine or in Bavarian towns?—PRESBYTER.

3599. **Book on Lenses.**—Can any reader tell me if there is a book on photographic lenses; if so, where can it be got, and what is the price?—FLUSH.

3600. **Lantern Slides.**—I wish to make a number of lantern slides from wood engravings and ordinary silver prints. I shall be much obliged if anyone will tell me the most suitable dry plates, lantern plates, developer, etc.? If possible I do not wish to intensify or tone the slides. Ought the maximum amount of contrast to be obtained in the negative or not?—H. C. L.

3601. **Lantern Slides.**—I should be much obliged to anyone who could give me some information about toning lantern slides, the best solutions, etc., for Thomas' plates, also which developer is most suitable. What is the best and surest way of cleaning covering glasses?—J. E. P.

3602. **Potassium Chloro-platinate.**—Will someone who has made the above give me directions for making it?—W. B. WOOLAND.

3603. **Shutter.**—Will anyone kindly advise me which shutter to get for general use? I do not want a very expensive one, but a serviceable one at a moderate price.—FINISTERRE.

3604. **Stereoscopic Slides.**—Amongst the slides for competition, I noticed one marked "Lower Falls, Rydal." I make bold to ask the owner if he would be kind enough to favour me with a copy of same, as I consider it a gem. Will gladly pay all expenses.—F. DART (address with Editor).

3605. **Light Camera.**—Can anyone recommend a camera light and portable, and at the same time capable of being used with portrait lens? Would Lancaster's International answer this description?—D. R.

3606. **Intensifier.**—After steeping in uranium I placed negative in 10 grs. to 1 oz. of potassium ferrioxanide. Result: Negative on drying stained a dark red, and film cracked in several places. Can any one tell me what is wrong?—D. R.

3607. **Blackening for Stops.**—Can any brother amateur tell me what chemical it is which is used for blackening stops. I do not mean the material usually sold by Tylar and others, and which is generally laid on with a brush, but a very simple solution into which the stops are dipped, and thereby stained black? I had the receipt in a paper which I had a short time since, but have unfortunately lost it.—L. LEEDER.

3608. **Perfection Lamp.**—Has any reader used Beahm and Froud's Perfection dark-room lamp? I have one, but am almost afraid to use it, as the light is so brilliant I fear it will fog a plate or paper.—G. H.

3609. **Halation.**—I wish to photograph the interior of a church, in which a large clear-glass window directly faces the camera. Will some brother amateur kindly tell me the best method of procedure, so as to escape halation, and much oblige?—CAM.

3610. **Collotype.**—Will some one kindly put me up to this process? I want, if possible, to prepare the plates myself, from my negatives of views, etc., so that I may use same in my printing-press.—G. H.

3611. **Toning Silver Prints.**—I have been using the acetate of soda bath for toning my silver prints, but the results have been very "mealy" and "wishy-washy" prints. Can any one tell me where I must be in error in my toning. Before toning I pass the prints through soda (common crystals), but cannot get a rich purple colour.—A CROWE QUILL.

3612. **Forrest's Due Ratio Shutter.**—Is this a

good shutter, and does it cause any vibration of the camera when in use?—SANTOS.

3613. **Dye for Canvas.**—Can any one give me a recipe for staining or dyeing canvas the same shade of brown as the ordinary canvas camera cases?—NIGER.

3614. **Easter Tour in Yorkshire.**—A number of friends think of visiting Adel, Yorkshire, and immediate vicinity, on Easter Tuesday. Will anyone kindly state particulars as to places of interest suitable for photographing?—G. K.

3615. **Bromide Paper.**—Would like to know the ammonia bath for bromide paper when using the hydroquinone developer, should yellow stains occur; the proportion of such bath; how made?—X. Y. Z.

3616. **Micro-photography.**—Can any reader of the AMATEUR PHOTOGRAPHER kindly tell me the difference between the chemical and visual foci in micro-photography? Also a good book on the above?—LUDER.

3617. **Reversing Back.**—Will any kind reader give instructions how to make a reversing back to a whole-plate camera, or lend me one to work by?—B. S. P. (Editor has address).

3618. **Amateur Starting.**—Will anyone kindly advise me as to the best mode of proceeding? Is it best to buy a whole-plate camera, and using frames for quarter and half-plate, or begin with half-plate? Also say whoso make and kind of camera and lens are best? I wish to take sea views and landscapes, as well as portraits, and wish to get a good instrument at start, so as not to require changing. Can this be done? Any information and other advice will be appreciated.—CHEMIST.

QUERIES UNANSWERED.

Feb. 21st.—Nos. 3471, 3476, 3478, 3491, 3493, 3494.

29th.—No. 3517.

Mar. 7th.—Nos. 3528, 3530, 3531, 3542, 3551, 3554, 3555.

14th.—Nos. 3561, 3566, 3575.

ANSWERS.

3353. **Lancaster's Special.**—Quite reliable, except the ground-glass, which is not at all satisfactory, but you can easily replace it.—J. H. MONTAGU.

3417. **Conveyance for Touring.**—The Multum in Parvo photographic portmanteau, made by Houghton and Son, High Holborn, would be a very good investment, and much better than any home-made apparatus. It is fitted with every necessary for developing, and will also carry camera and extra plates.—THE SMITH.

3417. **Conveyance for Touring.**—I fear an amateur photographer with a hand-barrow would appear very undignified, looking too much like the ferret portrait takers of Hampstead Heath. Better leave the development over till your return home, trying an occasional plate at night in your hotel or lodging-place. Of course you could hire a tricycle and use it, if the district you purpose visiting has good roads.—T. S. MAYNE.

3430. **Wide-Angle Lens.**—As you have an Instantograph which gives you satisfaction, why not procure Lancaster's half-plate wide-angle, which will screw into your Instantograph flange. I have in occasional use a pair of Lancaster's wide-angles in stereoscopic camera quite satisfactory.—T. S. MAYNE.

3435. **Photographing in Riviera.**—No restrictions, except in the interiors of churches, for which, in some cases, you require a permit. A small gratuity, however, will in most instances overcome this. One of my friends has lately been over the district you mention, and experienced no trouble. For an occasional trial development he used his bedroom at night. Provide yourself with some stout drawing pins. I should mention that at Monte Carlo you have no chance of obtaining photographs of the interior of the Casino; prohibition rigid, even for parcels.—T. S. MAYNE.

3437. **Object Glasses of Field Glasses.**—Write, enclosing stamped envelope, to J. A. Forrest, Esq., Alexandra Road, Birkenhead, an old and ardent amateur of forty-five years' experience. It was only last week, at a monthly meeting of the Birkenhead Society, he was explaining the subject you enquire about.—T. S. MAYNE.

3437. **Object Glasses of Field Glasses** are not suitable for mounting as a rectilinear lens. Apart from the difference of the foci of the visual and actinic rays, it would be found that the focus would be much too short for general work. For instance, a pair of lenses of 6 in. focus, which is about the average for field glasses, would, when mounted as a rectilinear lens, have an equivalent focus of not more than 3 in. They have, however, been used with some degree of success as landscape lenses, in which case they must be stopped down to $f/22$ or smaller, and after focussing the camera must be racked in a distance of about $\frac{1}{3}$ of the equivalent focus.—THE SMITH.

3441. **Rouch's Detective Camera.**—Time exposures can be effected. The camera is well made. The plates, after exposure, are lifted by an ingenious spring, and a light-tight flexible bag, then

removed to the back of the box. The lens is very good R.R., arranged and fixed for objects 20 feet distant. I consider it the best of this class of camera; it claimed most attention at the Crystal Palace Exhibition of 1889. One of my friends then bought one, which has given him every satisfaction.—T. S. MAYNE.

3452. Lantern Slides.—If "Novice" is now only trying for the first time making lantern slides by reduction, he will find the dry plates simple and easy to work. For twenty years I was a wet-plate worker, and although I look back with pleasure and delight on the happy days of youth (over thirty years ago), I should never think of returning to wet collodion. Try Mawson's lantern plates in Griffith's reducing camera or box, only 12/6 half-plate, give me excellent results; two minutes' exposure in the open diffused light. Use Thomas' hydroquinone formulae, full strength, for developer. As to comparative length of exposure, wet or dry plates, that is a matter of little moment when reducing.—T. S. MAYNE.

3454. Slide Exposure.—See answer to 3452; read also on page 76, March issue, *Optical Lantern Journal*, 1d., published at Salisbury Square, Fleet Street. The issue I quote treats specially of the subject you enquire about, but for a handy book of reference, Heworth's "Book of the Lantern," published by Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill, E.C., should be obtained.—T. S. MAYNE.

3457. Shutter.—The best shutter I have ever used is Newman's patent, working in the diaphragm slit between the lenses, capable of adjustment for any exposure between $\frac{1}{100}$ sec. and 1 sec., and also time exposures beyond 1 second. R. and J. Beck use it in their hand-camera. Sharp and Hitchmough, Dale Street, Liverpool, will quote and supply you with quarter-plate Newman shutter. They also manufacture the Paul Lange double curtain for very rapid exposures. Dark-room; gas lamp, Fallowfield's argand burner and ruby chimney; 4s. I believe I paid for mine. Metal binding for slides, good but somewhat expensive, 1s. 6d. per dozen; requires also a special cement, clamping frame, and pressing tool. When once bound are very neat and good for slides having to withstand much handling. Maker is W. C. Hughes, Mortimer Road, Kingsland, N.—T. S. MAYNE.

3457. Shutter, etc.—Lancaster's shutter is a very fair one. For diagram see the back of AMATEUR PHOTOGRAPHER.—J. H. MONTAGU.

3457. Shutter, etc.—The Thornton-Pickard would answer your requirements; price 18s. 6d. quarter-plate. It will give exposures from about $\frac{1}{100}$ sec. to any length. Messrs. Perken, Son, and Kayment make a gas lamp for dark-room, and the metallic binding slips for lantern slides may be obtained from Hughes, Mortimer Road, Kingsland, N.—THE SMITH.

3472. Cyanotype.—I think "Enquirer" will find that the proportions of ammonio-citrate of iron and ferridcyanide of potassium are not equal, but 1 to 2 to 1. The former is increased when the negative is very intense, or when greater intensity in the print is required.—THE SMITH.

3487. Exposure.—Wratten and Wainwright's instantaneous are quicker than Ilford ordinary. Wratten's have also a special drop-shutter plate, somewhat high in price, but certainly very good. Doubtless "E.W." is aware the Ilford Company also make an extra-rapid series, on which, however, somehow I have failed to obtain density. Mr. Paul Lange, one of the best amateurs I know, finds the same. He has taken all his medals, landscape and quick shutter work, using Ilford ordinary plates—I refer to his negatives—and he would not use any other. For myself, I like the Mawson plate, with their own developer, best of all. Some of the very best workers, Menzies, Gibson, Sutcliffe, etc., also give the Mawson plate the highest praise.—T. S. MAYNE.

3505. Pizzighelli Paper.—The Pizzighelli paper should not be made wet whilst steaming it, and if the negative is also quite dry, the paper will not stain it at all.—L. R.

3518. Photographs of Trains.—You could get them, I should think, at the London Stereoscopic and Photographic Company, in Regent Street or Cheapside, or else there is a shop in the Bayswater Road, just by Queen's Road, where they are all sold.—J. H. MONTAGU.

3529. Reducer.—The simplest way before toning is to use platino chloride in place of the gold salt. After toning, the prints should be soaked in a weak solution of cupric chloride if they are too dense. I think there is no fixing solution which is any better than soda hyposulphite.—SICILIAN.

3533. Over-Exposed Plate.—Do not add all the alkali in your formula at once. Add half at first, and if the image comes up sooner than in one minute, add a little bromide of potassium—very little should be added, for bromide is much more powerful with quinol than with pyro—and allow development to proceed slowly; add the remainder of the alkali to get density if necessary. If the image comes up in about one minute, add the rest of the alkali in two separate doses. If it does not appear in one minute, the plate is not over-exposed.—SICILIAN.

3537. Isle of Wight.—If "Nero" will write to me, I will give him my experience of a fortnight's

stay in the "garden of England."—SICILIAN (address with Editor).

3539. Precipitation of Bromide Paper Developer.—"Colonist" should not dissolve his ferrous sulphate in hot water, as it is in danger of being partly converted into ferric sulphate, which has no developing power. The reason why some of the salt has been thrown down is that one part of hot water can dissolve one part of the salt, whilst the same quantity of cold water can only dissolve $\frac{2}{3}$ part. It does not matter in the least about there being crystals in either iron or oxalate bottles. In fact, they are good indications that the solutions are saturated, and the bottle should be filled up with water as fast as the solution is used, until the crystals disappear from the bottom, when more should be added.—SICILIAN.

3544. Plates.—Write Ilford Company direct; enclose envelope. They will let you know no doubt where in Antwerp and Brussels you can obtain Ilford plates.—T. S. MAYNE.

3545. Angle of Lens.—My reply was wrong, and I apologise for same. I was thinking of the size of the picture resulting from the greater covering power of the larger lens. Many thanks to those who corrected my error.—E. J. FEILDEN.

3548. Stereo Slides.—The glass stereo slides are either on wet collodion or on slow bromide plates, such as lantern slides are produced on. "Stereo" can get these from W. T. Chadwick, St. Mary's Street, Manchester, who makes a speciality of stereoscopic apparatus.—SICILIAN.

3555. Opal Printing Frame.—See "Year Book of Photography" for 1889, page 189.—THE SMITH.

3557. Fitting Lens with Rack and Pinion.—You would have to get an entirely new mount for your wide angle combinations, and also sacrifice the iris diaphragm. Is it worth while?—THE SMITH.

3558. France and Italy.—No permit is required, and the officials at the custom-houses are very polite. There is no trouble whatever with plates. It simplifies matters to use labels written in various languages, which are sold by some dealers.—A. J. CROSS.

3560. Brighton.—It depends on choice of subject. Light is always better at the seaside, and quite good enough for any amount of instantaneous work, providing suitable subjects are found.—SUCCESS.

3560. Brighton.—(1) Yes. (2) It all depends upon the weather. If it is bright and sunny, Ilford ordinary will do; if lens is not stopped down too much.—SUNLIGHT.

3560. Brighton.—Very good for hand-camera work. If "J. F. T." will call on me, I will give all information, etc.; address with Editor.—C. HETHRON LEWIS.

3560. Brighton.—I should think that camera would do very well for Brighton. Use Fry's or the Ilfords.—J. H. MONTAGU.

3562. Hand Camera.—Both the Ideal and the Victor hand-cameras are good, but I prefer the Ideal. It is light, small, and the shutter is excellent. There is only one movement, and no focussing. The makers informed me that any lens could be fitted. It is so novel that it is well worth seeing.—A. J. CROSS.

3562. Hand-Camera.—The Ideal is better than the Victor, being handier, lighter, and the method of changing the plates is better. The Ideal has a short-focus lens, everything being in focus over 10 ft., while the Victor has a lens of long focus; and nothing under 27 ft. is in focus. After examining a great number of hand-cameras, I came to the conclusion that the Ideal was the best in the market.—G. F.

3563. Lens.—Ross's rapid symmetrical lens for groups, views, architecture, and general out-door work; as I wrote last week, nothing but praise can be accorded to it. See also answer to 3495, last week.—T. S. MAYNE.

3563. Lens.—Ross's rapid symmetrical, not Rectigraph, is a splendid lens for all-round work. You could not do better.—SUCCESS.

3563. Lens.—Ross and Co. do not make any lens under the name of "Rectigraph." Are you sure it is a Ross lens?—THE SMITH.

3564. Mountant.—Ordinary commercial gum is not suitable for mounting silver prints, as it is generally acid. Gum arabic mucilage is very suitable, but it will not keep for long. I do not know of a mountant that will answer all your requirements. I always use starch paste; it is the best mountant, and will keep for seven or eight days. If a number of small packages of the ingredients are made up, it is a matter of one or two minutes to make up a fresh lot.—SUNLIGHT.

3565. Pizzighelli Paper.—You can use this either with or without preliminary steaming with equally good results; but it must be steamed after printing, and before clearing.—W. B. WOODLAND.

3565. Pizzighelli Paper.—You have been misinformed. Liesegang's Pizzighelli platina paper is exposed under the negative to light until all details are visible, and it is then exposed to the vapour of hot water, which turns it to a black colour.—SUNLIGHT.

3565. Pizzighelli Paper.—This paper does require steaming, or something kindred to steaming, before printing; but I have never found any staining of negatives from it, although I have used it for some time now, both with varnished and unvarnished

negatives, but it is not on the whole satisfactory, and I am giving it up.—POOR CHINEE.

3567. Enlarging Lantern.—Lancaster's Multum in Parvo camera, for enlarging up to 12 by 10, copying, or reducing; is only 30s. I believe you will find daylight working more satisfactory. Unless you require the lantern for showing slides very frequently, why not hire occasionally a lantern, a single one, with oxygen cylinders? See 3570 about screens.—T. S. MAYNE.

3567. Enlarging Lantern.—I do not think that Mr. Bennett will get a lantern to answer both his requirements satisfactorily, and for this reason—if the condensers are large enough to cover half-plate, I should not expect them to transmit enough light through a $3\frac{1}{2}$ square to properly illuminate a screen of sufficient size. I have seen it tried, but with very poor results. A remark of Mr. A. Pringle's, on page 174 of last week's issue, might be quoted here: "Condensers cannot be too small consistent with reasonable covering of the slide."—F. W. L.

3577. Enlarging Lantern.—You cannot do wrong if you get Hughes' Pamphengos. If you got one working a larger plate than lantern size you could easily make it take that size by fitting carriers, and use it for ordinary slides.—SUCCESS.

3578. Instantaneous Work.—The ordinary plates are plenty rapid enough for most shutter work.—W. B. WOODLAND.

3583. Instantaneous Work.—Red label, of course, as the others require longer exposure, and, although you might occasionally get one of the others sufficiently exposed, the chances are you would have a large number of failures in consequence of under-exposure.—SUCCESS.

3588. Instantaneous Work.—In ordinary light the special (red label) plates are necessary, but if the light be very good, such as at the seaside in summer, the "rapid" plates will be found to act perfectly well.—F. L. A.

3588. Instantaneous Work.—You will only get good results with Special (red label).—J. H. MONTAGU.

3570. Lantern Objectives.—I think the 21 ft. picture is rather large, and believe you will get a better picture if you only make a 15 ft. disc, with the 6 in. lens. In practical working, I used last week a 12 in. lens, giving about a 15 ft. picture some 6 ft. off the screen. I was right at the back of an audience of 1,100. Many have an idea that the larger the screen the better, no matter about the size of the room; this is a mistake. Another false idea is, it matters not how thin the screen is so long as it is white. Try this experiment with a simple old-fashioned white screen: attach a large piece of white cardboard to the back of the sheet, then throw the light from the lantern on the face of the screen. You will find where the cardboard is it will show an intense white patch, and the other part will be quite grey in comparison. Mr. Andrew Pringle, in his address on the "Optical Lantern," at the Camera Club, on the 6th inst., refers strongly to the nature of the screen—25 per cent. of the light may be lost to the observers with a bad screen. Refer for full report, *Photographic News*, March 14th, p. 211.—T. S. MAYNE.

3571. Some Points about Lens.—The best reply to this will be for "N. M. H." to get the AMATEUR PHOTOGRAPHER for March 1, 1889, and he will find full information there, in my paper on lenses.—C. HETHRON LEWIS.

3572. Hand-Camera.—Yes; and the best thing "N. N." can do is to get the detective case supplied by J. Lancaster and Son, to carry quarter-plate; Instantograph, price £1 1s. It includes the shutter.—F. L. A.

3573. Lantern Slides.—Most certainly they ought to be varnished. There are many advantages, the most important of which are protection from damp and the filling up of scratches on the surface of the film.—SUCCESS.

3573. Lantern Slides.—No; there is no need to varnish the lantern slides before binding them, as they are perfectly protected from harm by the glass in front, and it is only a waste of time, trouble, and varnish.—F. L. A.

3573. Lantern Slides.—It is best not to varnish them, as, if at any time you wanted them coloured, there would be a trouble in removing the varnish, a procedure the colourist would object to. If they are not to be coloured, it is better, though not a usual practice, to varnish them.—A. J. CROSS.

3573. Lantern Slides.—All the text-books advise varnishing, but I never do so, and have some taken five years ago which were not varnished, and are as good now as ever.—C. F. S.

3574. Hand-Camera and Lenses.—Taylor's lens I can personally recommend. If absolute sharpness is wanted without focussing, then the 4-inch focus lens is best, but it gives small image unless close to object. I prefer 5 in. focus and a focussing scale on camera.—C. HETHRON LEWIS.

3574. Hand-Camera and Lens.—I can strongly recommend "Carlsbad" to try Fallowfield's Facile hand-camera. It has the most simple and reliable form of plate-changing I know, and each plate is certain to be in accurate focus. The lenses fitted to the Facile are splendid for lantern-slide work, but no doubt Fallowfield could fit Taylor's or any other preferred. "Carlsbad" should write for specimen prints.—ZENO.

3574. Hand-Camera and Lens.—(1) It is hard to

recommend one as being superior to others, there being so many excellent ones in the market now. I use one of Abraham's, and find no fault with it. Am most successful. (2) The plate-dropping style is reliable, and kept in register. (3) Taylor's are very excellent lenses.—SUCCESS.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUESDAY MORNING'S post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED:AM:PHOT:

JOHN PRIE.—You will note that we insert your letter. The cutting re "Experiments with Oxygen Cylinders" came to hand from several correspondents.

H. H.—We think there is a great deal of correctness in the dealer's advice. There is no hand camera of any service which contains more than twelve plates.

R. E. D.—Hand camera No. 1 is not yet in the market. 2 and 3 are both good cameras, and are both worth the money asked for them. 4 is complicated in construction, and we have had no opportunity of testing it. 5. Have never seen this apparatus. 6. This is a thoroughly reliable instrument, and we have every confidence in advising you to purchase if you want a cheap and useful hand camera. 7 and 8. We know very little of 7; is well spoken of. 9. This is a very useful and compact camera, and you should see it. 10. Very handy and well made. Summing, we would place them in this order: 6, 9, 10, 2, and 3. Question 11. Very excellent enlargements are made from the films. We should advise lens No. 12.

BANSEER.—Should not think any great benefit would come by the exchange. Very good work is possible with the one you name. For a lady we should advise hand camera No. 2; it is very handy, and not obtrusive. No. 1 is cheaper but much more bulky, still a most reliable instrument.

J. SHAKESPEARE.—Two of your slides were shown on Friday, and two on Saturday; sorry not to have had the pleasure of meeting you.

W. H. SCOTT.—Your compliments and kind expressions upon our efforts are much appreciated.

SIGMA.—Either faulty paper, or more probably flare spot. The photograph is up to about the average of beginners' work.

E. NORTHCOTT.—We thank you for your letter; the opinions expressed do not quite coincide with ours; no doubt the work you contribute to our next competition will be of a higher standard.

J. WALLIS B. MASON, M.D.—The suggestion contained in your letter shall have our attention. Glad you consider "Home Portraiture" the best yet brought out.

H. FERRIER-KERR.—Either B or D; as you give a limit in price, would you like us to select for you? Your remarks upon the QUARTERLY and "Prize Pictures" are very encouraging.

ROBERT HARVEY.—The quotation is probably from a paper called "The Magic Lantern or Optical Enlarger;" you would probably be able to obtain a copy of any photographic dealer. If not, we will endeavour to procure it for you.

ATHENIAN.—We do not know anything of the camera. You had better advertise in the Sale and Exchange column. There are generally many offered for sale.

X. Y. Z., CONSTANT SUBSCRIBER.—The apparatus you did use was by a first-class maker, and far in advance of the A and B, still you may do good work with A, which will come within your price. Good pictures are taken with detective cameras, but we should not advise you as a beginner to start with one. There are many "sets" offered in our Sale and Exchange columns that would suit you.

PHONO.—We should advise in the following order: D, C, B. (1) The euryscope form of lens may be used for practically the same as the rapid rectilinear, and works with a larger aperture. (2) Some workers uphold the qualities of the Jena glass, but it is an open question whether the lenses made of it have any very distinct advantages.

HENRY G. CLARK.—The less trying would certainly be orange or canary medium, a very safe light. We should work by diffused daylight rather than by any form of artificial light in the dark-room. We know of no special precautions; with canary medium much more light is possible than with ruby.

MARIE DE MEUDON.—We should advise you to buy No. 1. Send 75d. in stamps to Messrs. Peasegood and Wollaston, Photographic Exhibition, Crystal Palace, and they will forward catalogue. Many thanks for the cutting. Your query is inserted.

L. RIDLEY.—We do not care for either, but consider A the better of the two.

J. W. GAMSON.—We should advise for the purpose H, the R.R. lens.

TORPEDO.—Later on we will let you know what we think of your photograph. (1) If you want it for both purposes, have the "group size," 8½ by 6½. (2) No advantage, except that your plate will be certain to be covered sharp to the edges. (3) Unfortunately there is no uniformity either in sizes or threads, and we question very much whether the two lenses you mention would fit the same flange. You will probably have to make a new front.

JOHN H. MONTAGUE.—Cannot recognise your reference to query.

G. H. G. CARMICHAEL.—We will endeavour to send you a copy as requested; your letter has been sent on to Mr. Mayne.

R. P. VULLIAMY.—We shall soon take the matter up. What has your query about quarter-plates reference to?

THISTLE.—The conditions of our "Travelling Studentships" are in the printers' hands. (1) On no condition will photographs be eligible that have been exhibited at any exhibition, or entered for any competition, open or otherwise. (2) We will certainly look up the photographs; sorry you should have had any difficulty in previous competitions. (3) We must, of course, accept your statement, and can only say that such being the case you have a most remarkable picture. We shall take an early opportunity of calling Mr. Robinson's attention to the picture.

REX.—Your photographs are very promising. No. 1: The landscape is well chosen, rather lacking in definition; you should have used stop f/16. No. 2 is a very fair picture, but your lens does not cover sharp to the edges, and your photograph is not so bright as it should be. No. 3: Your portrait study is badly posed, and taken too full face. You will do well to study Robinson's "Picture-Making by Photography." We have no doubt that with careful study and more practice you will soon be able to send us much better work. We should advise you all this season to confine yourself to (1) landscape and (2) landscape with figure.

REGINALD BENNETT.—The lens you left with us has been laid by. It is an old-fashioned single portrait lens, and only worth a few shillings. The definition is very poor. We should think it would not cover more than quarter-plate. Many thanks for your opinion of "Home Portraiture." Glad to hear that the prize pictures "adorn the walls of your rooms."

F. R. C. S.—We have your MS., and will take an early opportunity of perusing the same. From a very casual glance we think it will be admirably suited to one or other of our publications.

A. CORNISH (Quimper, France).—We have handed over the cash in our hands to the firm named in your communication.

S. G. J. PARKEN.—The lens is a very fair all-round instrument, and if worked with, say, f/8, would be serviceable for instantaneous work. It is a lens that you can do most work with. We are returning it to the address named.

E. BECK.—See reply to "Thistle." The whole of the work must be done for us alone, and never entered any competition of any kind; so you will see no medalled or unmedalled work is eligible that has been exhibited. The rules and conditions shall be sent you, and we shall be very much obliged if you will send in a list of likely competitors in your Society, and they shall have a copy sent them.

JOSEPH CHAMBERLAIN.—At once, on receipt of paper, it shall be set up. The Crystal Palace Show is dealt with at some length this week. See "Our Views" on the question of the Societies, and the professional and amateur.

REV. H. J. PALMER.—Shall be glad to hear from you when quite convalescent.

J. H. TAYLOR.—We have looked up the reversing head, and are sending them by rail.

ALEX. KEIGHLEY.—See reply to "E. Beck" and "Thistle."

WM. FURNISS.—Am afraid we cannot help you. The note came to us as news, but have inserted your letter as a query.

C. F. DAVIS.—We have your MS. for REPORTER, and will submit proof. One of the series might well appear every month. About the pamphlet, we will write you later on.

NIGER.—"Picture-Making by Photography." Afraid we don't deserve half you say of us, but we shall continue to do our best. Your letter is very encouraging.

REV. E. F. POPE.—You will see we have made a special appeal. Very many thanks for your opinion of 4½ years of AMATEUR PHOTOGRAPHER.

DEVONIA.—We shall be pleased to see you at Creed Lane next Tuesday between 2 and 5 p.m., and shall be at the Crystal Palace on Saturday next from 5.30 to 8 p.m. Our whereabouts will be found on application to attendant at AMATEUR PHOTOGRAPHER stall. Delighted to see your work.

T. B. JUDSON.—We thank you for your letter. The report appears under "Societies' Meetings." Our publishers will be pleased to send you a packet of specimen copies for distribution if you would take the trouble. Perhaps you would send us some of your work to criticise.

REV. ANDREW JOHNSON.—You will be pleased to note that Mr. Mann's photographs, which you so much admired, have received an award at the hands

of the Crystal Palace judges. Our editorial upon them practically answers your questions. It is kind of you to say, "As a very ancient practitioner of photography, I must thank you for your admirable periodical."

ALEX. PITKETHLY.—We will write you in a few days about the Forth Bridge pictures, and send a medal, etc.

A. D.—Use a screen of tissue paper between sitter and the flash-light apparatus.

R. L. F. H.—The firm have never afforded us an opportunity of inspecting the shutter you name, or the set. We never advise, except we have had the apparatus in our own possession. All apparatus submitted to us by makers will be returned within fourteen days, but we cannot report upon photographic apparatus that we have never seen. It is our rule never to recommend apparatus upon hearsay. Glad you were pleased with AMATEUR PHOTOGRAPHER slides at the Palace.

B. S. P.—Do not know such a firm.

ROBT. L. WALKER.—If you buy C, you will have one of the best all-round lenses in the market. They are thoroughly reliable.

FRISTERRE.—It would be rather unkind of us to criticise your first efforts, but we will be merciful. (A) The angle of conservatory should not have been in the picture, and you have fogged the extreme right hand corner. The view is not well chosen, and "doggie" is sadly mutilated. Stop used and exposure about right. (B) Why use so small a stop as f/84, and why include on your plate the window-frame? We are surprised that you should have got so good a picture, seeing that the camera was in the room and that the photograph was taken through the window. With the stop used you might very well have prolonged the exposure. (C) Almost everything is out of focus. Your subjects are none of them good. We should advise you to read up, say, "Photography for All" (Harrison), or Burton's "Modern Dry-Plate Photography," and then study "Picture-Making by Photography" (Robinson); you will then soon acquire a knowledge of how to take a photograph, and what constitutes a picture. Your prints are returned.

CHUBB'S PATENT.—The entry forms have or will be sent you. Yes, on mounts, not cards. You may mount them yourself when sending in to the "Ladies' Competition," or have them mounted for you.

GEO. R. JOHNSTON.—We note the formation of the Club.

RUSSELL.—We should advise you to have the R.R. lens that is sold with the camera. You could rely upon the firm to sell you an article that would give you satisfaction. Many French lenses are well worth the money asked for them, but as a rule they are corrected and tested as English lenses are. We shall be very pleased to "loan" you lantern slides for another occasion.

MRS. ARKCOLE.—Prints sent in for the "Ladies' Competition" may be "landscape or seascape, landscape with figure, genre or figure study." The competitors may select either subject, or contribute prints in each subject.

J. HENRY HARDY.—Your opinion of "Home Portraiture" is very flattering. (1) It is not wise to exhibit lantern slides made from pictures that have been copyrighted. You had better apply for consent, it is almost certain to be granted. (2) Certainly; if you go in for one, have the larger size. We have seen some very excellent work done with it, and the larger size has distinct advantages over the older type of camera.

W. W.—No. 2.

S. H. EARNEST.—Have no knowledge of the lenses or the maker.

JOHN A. E. LANE.—We know nothing of A, but do not think the firm are makers. B, one of the best lenses in the market; C, a most excellent shutter.

PINEOTOS.—You will do well to have C or D, both good shutters.

W. T. GREATBATCH.—You do not say whether the colour is after or before exposure to daylight.

THOS. ROCHE.—Will see if we can procure you the stereo slide you wish to have.

F. S. S.—Will reply to you later.

G. W. SWINERTON.—Thoroughly, a first-class camera for the money.

T. C. BAKER.—We will write to the competitor, and try and persuade him to let you have a copy of the stereo slide. Glad to hear that the exhibition of them in your town gave so much satisfaction.

A. C. L.—Fairly well, but a long way off "Monthly Competition" standard. Yes, you will be able to do much better with the apparatus that you have. You have not enough gold in your toning bath; increase it, and you will get a better colour.

TYRO-TYRO.—We can thoroughly recommend you to buy No. 6. It is in every respect a most excellent H.R. lens, and worth all the money asked for it. No firm turns out better work. Delighted to hear your good opinion of the AMATEUR PHOTOGRAPHER.

ZINKENITE.—No. 1 is an exceedingly good portrait lens. We do not think No. 2 is worth the extra money.

LANTOS.—Very glad you are satisfied with our advice as to lens. Our publishers would tell you about postage of REPORTER. The shutter you ask about is a very fair one for a cheap shutter. We can show you one if you like to call.

GEO. HEMMING.—The papers read at the Camera

Club Conference yesterday and to-day will be published in a special number of the *Camera Club Journal*, price 1s.; we think the Hon. Secretary, Mr. G. Davison, will be pleased to see that a copy is sent when published, and on receipt of stamps. Our publishers will procure you a copy of Wilkinson's book, but cannot say price. There is a capital book by H. C. Middleton, published at 5s., that might answer your purpose.

A. HOWARD SHORT.—Do not know the camera at all. The firm is another of those who do not consider that it is to their interest that we shall see all the new apparatus they bring out.

G. N.—Undoubtedly, certainly not. If we can return the slides we will, but cannot promise.

CHEMIST.—We never gives names; see our rule at the head of this column; if you comply with it, we shall be delighted to help you.

W. A. WHISTON.—Sorry to hear that the camera you have tried is a failure. Why? The handiest are certainly 3 and 7. Never heard of a roll-holder being fitted to the latter. The method of changing plates is exceedingly simple, and it has a right to the title "detective" camera.

P. R. S.—If you want a lens to do all-round work such as you name, you should have an R.B. The one you name is probably of French manufacture, and, for the money, is about as good as you can expect.

Monthly Competition.

We have received the following entries for the next Monthly Competition, "Landscape with Figure" (No. 10):—

Title of Print.	Name of Sender.
Bouldner Park	Lieutenant Stuart Nicholson
At Carthage, Spain	Cecil V. Shadbolt
View near a Cottage	Wm. Burrows
Evening in a Staffordshire Lane	Frank Udall
Epping Forest	Miss A. H. Lloyd Roberts
Boating Picnic, Barcombe, Lewes	Mrs. Margaret Cole
In the Silchester Woods	H. H. Sealey
Reeding, River Adur, Sussex	A. L. Spiller
A Gloucestershire Harvest Field	James Drew
Snowscape	A. Steiglitz
View on Ballygrant Lock	A. Ferguson
Rising	S. M. Hancock
Near Instigoe, co. Kilkenny	W. H. Scott
By the Esk River	D. R. Clark, M.A.
A Bright Scene	L. W. Tindal
Within a Mile of Edinburgh Toon	R. A. Rayner
An Itinerant Photographer	T. Edwards
The Forthcoming Boat Race: Ten to One on Cambridge Children on Village Green at Bachelor Lane	Miss M. J. Hands
A Wayside Cross, North Devon	Mrs. Louisa Macdonald
The Gentle Craft	W. J. Kidd
Abinger, Surrey	C. Greene
Going Home, St. Chad's Church, Lichfield	A. C. Hunter
"Now is the Winter of our Discontent made Glorious Summer"	F. H. Davies
A Favourite Pool, on the Medway	Miss Louisa Maw
Croft Land, Isle of Lewis	Rev. Harvey Brooks
A Garden in Old Hampstead	J. G. Maclean
In the Wood	A. J. Ashmore
	A. Crowshaw

Sale and Exchange.

RULES.—Fourpence for twelve words or less, and a penny for every additional three words, must be enclosed with each advertisement, together with the name and address of the sender, which must be paid for, and sent to Hazell, Watson, and Viney, Ltd., 1, Creed Lane, Ludgate Hill. Halfpenny Stamps preferred. A single figure, or group of figures undivided by letter, space, stop, or *uo*, counts as one word; compound words count as two words.

REPORTING UPON APPARATUS.—The Editor of the *AMATEUR PHOTOGRAPHER* will be pleased to report, to any intending purchaser, upon apparatus etc., offered for sale in the "Sale and Exchange" column, provided such apparatus, etc., is forwarded by the seller to him to the offices of the *AMATEUR PHOTOGRAPHER*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C., free of charge. The intending buyer to pay a fee equivalent to a commission of 2½ per cent. upon the sale price of the apparatus, etc. The publishers will undertake the packing and sending of all goods at the cost of the seller. As far as possible, the Editor will undertake to send a report within two days of receipt of goods.

DEPOSITS.

Deposits for goods to be forwarded on approval may be made with our Publishers, who will hold the

amounts deposited until they are satisfied that the transaction has been executed to the satisfaction of both parties. Cheques and Post Office Orders should be made payable to Hazell, Watson, and Viney, Ltd. A nominal charge of 1s. is made whether a sale is effected or not.

N.B.—Trade Advertisements cannot, under any circumstances, be inserted in this column. Such advertisements can be inserted elsewhere at the *Trade Sale*, which may be obtained on application to Parry and Crawford, 1, Creed Lane, Ludgate Hill, London, E.C.

Air Pistol.—Nickel-silver air pistol, nearly new, in box, with dozen darts; cost 17s. 6d.; only 10s., or exchange couple of dark slides.—F. Armitage, Montague Road, Sale, Manchester.

"Amateur Photographer."—163 numbers, 8s. 6d. the lot.—Frank, 63, Gayhurst Road, Dalston. Eighty numbers to date; price 5s.—Seymour, Fennel Street, Manchester.

Apparatus.—Optimus 5 by 4 portable symmetrical lens, £1; 5 by 4 Plunge shutter, 15s.; both as new; quarter-plate Kouch's pocket camera, six double backs, 50s.; three-fold cyclist's stand, 10s.—G. E. Franklin, Rickmansworth.

Apparatus, etc.—Capital half-plate Instanto lens, 8s.; Forrest's due-ratio shutter to fit same, and extra adapter to fit Optimus R.R., 8s. 6d.; capital changing-bag, 6s.; half-plate tanned canvas camera case, with handle and straps, 7s.; and splendid triangular d-veloping lamp, with yellow and ruby glasses, all in capital condition. Also what offers for *AMATEUR PHOTOGRAPHER* from September, 1888 (including two special numbers), "Photography" from No. 2, both to date (one or two wanting) three annuals, and Abney's "Negative Making" 2—Findlay, 4, Cambridge Drive, Kelvinside, Glasgow.

British Journal of Photography.—1887, all complete. What offers?—Sherwood, 57, Blenheim Road, Reading.

Burnisher.—Marion's 3 roller, hot and cold, burnishing machine, just done up, as new, by maker; cost £6; offers wanted; approval.—Logan, St. Oswald's House, Tenby.

Cameras.—Lancaster's half-plate Instantograph camera, double dark slide, and stand, in perfect condition; 2 guineas; new last August.—B. S. Proctor, North Road, Cobridge.

Lancaster's half-plate, double-slide, three carriers, and one front (International), cost 19s.; cash 10s.—189, Southampton Street, Reading.

Superior camera and three slides for 5 by 4 and quarter-plate, in black case, perfect condition; 60s.; cost £7.—Bell, 4, Milton Terrace, Belfast.

Cameras, etc.—Quarter-plate Sciopticon camera, with four double slides, in enamelled leather case, five extra slides, and Manx stand, all in perfect order; cost £6 10s.; price £4 5s.—B. Boothroyd, Southport.

Shew's quarter-plate Eclipse hand-camera, three double backs, finder, focussing screen, canvas case and detective case, with horizontal and vertical finders; £5; cost £7 10s.—Dr. Winter, Station Hospital, Gosport.

Half-plate camera, by Lancaster, 1889 patent, reversible back, double slide, nearly new; has given splendid results; £2 14s.—P. Galley, Fern House, Murchison Road, Leyton, Essex.

Half-plate camera, three double backs, and tripod, in case complete, double lens, dishes, etc.; £4 10s.—Rev. F. Drew, St. Thomas' Street, Portsmouth.

Camera Case.—Camera case, leather, cheap, carry nine articles.—Adams, Hermitage Mews, Stamford Hill, N.

Camera and Lens.—Optimus detective camera, cost 6 guineas, price 3½ guineas; also Beck's 8 by 5 R.R., Iris diaphragm, cost 85s., price 65s.—Photo, Cotes Hall, Ecclesall, Staff.

Camera, Lens, etc.—Half-plate International, three double backs, wide-angle rectilinear lens, tripod, solid leather case, only used a few times; cost over £7; will take £4 10s. Quarter Excelsior set, swing and reversing back camera, four double slides, rapid rectilinear and a landscape lens, pneumatic shutter, and tripod complete; will exchange for portable stereoscopic set with moveable screen; difference in cash if first-class set.—Amateur, 1, Wellington Road, South Shore, Blackpool.

Camera, Slides, etc.—Whole-plate camera, all movements, with wide-angle adjustment, six double metal slides; price £5; new last December.—Apply, Bucknall, Francon, Kidderminster.

Camera Stand.—Alpenstock quarter-plate camera stand, Kouch's new; 15s.—Crump, Worcester Lawn, Gloucester.

Enlarging Lantern.—Optimus enlarging mahogany-body lantern, 7 in. condensers, four carriers, fitted with limelight, comprising high pressure gas jet, two 9 ft. gas bags, pressure boards, tubing, in n retort, quite new; £12; no lens.—Geo. Potts, Carlyle Road, Chesterton, Cambridge.

Changing Bag.—Half-plate changing bag, new last month; cost 10s.; will take 8s.—G. Fitch, Clovelly, Mayfield Road, Moseley, Birmingham.

Hand-Cameras.—Half-plate Beck's detective camera, six double slides, been used twice; cost 17

guineas; will take 12.—Edwd. Edwards, jun., 24, renchurch Street.

Kodak detective camera, equal new; cost 105s.; price 75s., or exchange with cash for Voightlander's half-plate rapid Burscope.—Bygrave, 15, Canterbury Road, Brixton, S.W.

Kodak, with about 75 films; price 60s.—Gerald Letts, St. Ann's Vicarage, Stamford Hill, N.

Lantern.—Magic lantern, will enlarge 4 in. condensers, splendid lens, three-wick lamp in box, 31 photographic slides, Conway to Bettwys, lightning slide holder, all new; 50s. the lot.—Smith, jun., 76, High Street, Wavertree, Liverpool.

Lenses.—Optimus Burscope, 7 by 5, perfect, 75s.; Apts view lens, 8½ by 6½, 17s. 6d.—Hall, 110, Ulleswater Road, Lancaster.

NOTE.—To ensure insertion all Communications should reach the Editor on Tuesday.

CORRESPONDENCE SECTION.—Anyone wishing to communicate with Contributors can do so by forwarding such Communication in stamped envelope under cover to the Editor, *Amateur Photographer*, 1, CREED LANE, LUDGATE HILL, LONDON, E.C.

THE "AMATEUR PHOTOGRAPHER" FIRST LADIES' PHOTOGRAPHIC COMPETITION.

PRIZES.

First Prize	Gold Medal.
Second	Silver Medal.
Third	Bronze Medal.

(These Medals, of the smaller series, will be appropriately mounted as Brooches).

SUBJECTS.

Landscape or Scascape.—Landscape with Figure—Genre or Figure Study.

CONDITIONS.

- Not less than six or more than twelve prints are to be entered for competition.
- All prints must be mounted, and the title (only) must be legibly written on the front of the mount.
- The work must be entirely the work of a lady, who must be a bona fide amateur photographer, and must have done all the work, except mounting, herself.
- The negative of the prize photographs must be at the service of the proprietors of the *AMATEUR PHOTOGRAPHER*.
- Photographs can be printed by any process, but must not be printed on opal, or mounted in optical contact on glass.
- All photographs must be sent in on or before the 31st of May.
- No prints will be eligible that have been entered for any previous competition.
- Entry forms will be forwarded on receipt of stamped addressed envelope.

NOTE.—The adjudication will be made by lady artists and lady photographers. It is hoped that it will be possible to make arrangements to exhibit the photo-

graphs at a *Conversazione* to be held in the offices, 1, Creed Lane, E.C., during the month of June.

Further particulars on application to the Editor, "*Amateur Photographer*," 1, Creed Lane, Ludgate Hill, London, E.C.

"AMATEUR PHOTOGRAPHER"

MONTHLY COMPETITIVE PAPERS, 1890.

The following Prizes are offered for competition every month:—

Three Prizes of £1 1 0 each.

Three Prizes of 0 10 6 each.

And Three Certificates.

The Papers must not exceed 1,000 words; and those which are awarded Prizes will be published in the *AMATEUR PHOTOGRAPHER*; others will be selected, and will be arranged for publication in the

"AMATEUR PHOTOGRAPHER'S ANNUAL."

Contributions are to be upon the subjects as list given below; and in order to make the matter more interesting, it is requested that each competitor shall give his *personal experiences*. It is intended that each subject shall be written up by a specialist for the ANNUAL, and the latest information given. All MSS. must be received not later than the

28TH OF EACH MONTH.

Subjects.

28th March	Optics.

OUR VIEWS.

"To hold as 'twere the mirror up to nature."—Shakespeare.

EASTER HOLIDAYS.—All Communications should reach us on Monday, or at latest on Tuesday Morning. The Paper will be on Sale on Wednesday, instead of Thursday.

THE fourth Camera Club Conference was well attended, and the papers listened to attentively. The discussions showed that more interest was taken in the subjects treated upon than in former years. In another column we give an account of the proceedings, and may at a later date again refer to the papers. The dinner of members and friends on Friday evening was a brilliant affair, and a most distinguished company were present, including many of the leading scientists of the day and delegates from foreign and provincial societies. The *Club Journal*, published on the 27th inst., contains, we believe, the whole of the text of the papers read and discussions thereon. If our summary is incomplete, it is due to the difficulty of securing copies of the papers from which to write a *précis*, rather than from any wish on our part to curtail the report.

One matter of great importance came before the Conference—the "Proposed Discussion upon Regulations for Photographic Exhibitions." We very naturally imagined that the subject would be discussed upon the points laid down in the circular, instead of which the conclusions arrived at by a Committee, based upon certain written opinions that had been received, were put forward, consequently much of the ground was cut from under the feet of those who wished to discuss the matter. In another column we give the suggestions of the Committee, which are, if possible, less workable than those offered in 1888, and it is not difficult to trace that the framing of them is really based upon Dr. Emerson's article, entitled "An Ideal Photographic Exhibition," contributed to this journal in October, 1885.

No Exhibition has been promoted upon the lines he laid down, although during the four and a half years that have

elapsed since then, many scores of exhibitions have been held, good, bad, and indifferent. We respectfully submit that, if the suggestions now put forward by the Camera Club be such as would in their opinion ensure a successful and popular exhibition, they try the experiment. The Club has been established nearly five years, and have never yet ventured to hold an exhibition, but are ready to arrogate to themselves the right to make rules for others. We shall not in this issue discuss the general question, but will wait till our readers have had the opportunity of learning for themselves how narrow and warped are the views put forward as being those of the Camera Club. We will only deal with three points: First, the question of medals. In 1888 efforts were made to carry the "no medals suggestion," but without avail, as the last two years' work of exhibitions conclusively prove. Second, the working of the Champion Class. It is desired to abolish this very salutary class, and, we suppose, to allow "pot-hunters" to send their one picture round the country and sweep away all the medals in the manner that obtained prior to the general adoption of the clause, or condition, which precludes the admission to any competition of a picture that has once gained a medal. In our opinion, if the Champion class is abolished, the rule of one medal only should be insisted upon. Third, prizes placed at the disposal of exhibition authorities for the purposes of advertising. We know that the two or three gentlemen who are so rampant about this matter are kind enough to include the AMATEUR PHOTOGRAPHER medals, but we may add that, so long as exhibition authorities hold them in the high esteem that they do, and amateur photographers consider the winning of them so high an honour, so long will they be, under certain conditions, at the disposal of the Committees of societies and others promoting photographic exhibitions.

It may be interesting perhaps to mention that the first recipient of a prize offered by the AMATEUR PHOTOGRAPHER was Dr. P. H. Emerson, and that at photographic exhibitions held since April, 1885, some seventy or eighty of our

For Contents, Prize Competitions, Notices, etc., see page 231.

medals have been awarded, also that connection with the AMATEUR PHOTOGRAPHER competitions upwards of one hundred during the same period. From the list of prize winners we have selected the following well-known workers to whom we have had the honour of awarding our medals, as showing that at least some of them have thought fit to consider the medals worth competing for.

ADCOCK, W. (1 Silver)	“Home Portraiture.”
AUSTIN, J. E. (4 Silver and 1 Gold)	Keighley Ex., 1889. “Holiday Work,” 1889. West Hartlepool, 1889. Royton, 1889. “Lantern Slides,” 1890.

We know reforms are needed in exhibitions, because photography has grown so rapidly; and with much diffidence, we submitted the following scheme to the Conference:—

A permanent photographic exhibition Committee to be formed in London. The members of the Committee to be drawn from—(1) The Council of the Photographic Society of Great Britain; (2) the Committee of the Camera Club; (3) the Presidents of provincial photographic societies; and (4) the Editors of the Photographic journals.

An annual exhibition to be held in London.

Exhibitions in certain provincial towns to be determined upon, to be held once in every three years.

The United Kingdom to be districted for photographic purposes. Say thirty-six centres to be fixed upon, an exhibition to be held in one of these centres once in every month. No two exhibitions to be held at the same time.

All exhibitions to be under the rules and regulations laid down by the permanent Committee; local Sub-Committees drawn from the societies attached to the district centre to work in conjunction with the permanent Committee through an organising paid staff.

Permanent paid judges to be attached to the permanent Committee, who would form a really competent examining board, not necessarily resident in London.

All medals and diplomas to be given by the permanent

Committee. Progressive medals to be given, varying in value, or preferably in design. The series of such medals to be, say, six, and only these six to be awarded to any exhibitor.

No picture to take a second prize at any exhibition.

All prize winners to supply the permanent Committee with a print, which is to be the property of the Committee, and framed at the expense of the Committee. Such pictures to be sent the round of the thirty-six centres, and afterwards returned in order to be placed in a gallery which should be provided for, and be under the control of the Science and Art Department, South Kensington.

In submitting this scheme, which was listened to with much attention, we did not expect any very strong expression of approval, and were prepared to hear some opinion as to the difficulty of securing funds, an obstacle which is met with in every undertaking, great or small, but if only a few of our great manufacturers will come forward in the same liberal manner as the Britannia Works Company have done, there should be no difficulty. An average donation of only 5s. per head from our own subscribers would form a fund quite large enough to work out the whole scheme.

A Committee formed as we have suggested would be a fit and proper body to draft rules and regulations for the governance of photographic exhibitions, and would bring about a consolidation of interests which at the present time is greatly needed. For ourselves, we will make no promise as to what we may or may not do, but our readers and all interested in photography may rest assured that we shall not be behindhand in giving financial and moral support to any scheme that shall have for its aim the union of interests and the advancement of the art and science of photography.

* * * *

ONE of the suggestions put forward at the Camera Club Conference, we think by Mr. A. Maskell, was the holding a photographic exhibition on the lines of the Academy or *Salon*. Mr. John Howson writes a letter upon the subject, offering to place £100 per annum for three years at the disposal of any representative committee that may be chosen to carry out this object. The idea of this photographic exhibition on the lines of the Academy is not new, and has been the subject of much “mere talk,” in which, we fear, it is likely to end. Still, should anything come of it, we shall be quite prepared, under certain conditions, to give it very hearty and liberal financial support.

* * * *

As photographic exhibitions are likely to be held on much the same lines in the future as they have been in the past, would it not be advisable for the Camera Club to give a list of those gentlemen who, in their opinion, are fit and proper persons to award prizes at such exhibitions?

* * * *

WE received a letter this week from a professional photographer of some note, in which he says, in speaking of the Camera Club and their suggestions, that he does not think they will carry out *all* of them; and of “one picture, one medal,” he says, “We won’t stand that. We (the exhibitors) have stood almost anything up to now, but now we are going to ‘rear.’ [At first we read this as, *we are going to the rear*, but on looking over the letter a second time, found out our mistake.] It is to be a jolly row.” Has this exhibitor considered that the giver of the prizes frames

the conditions under which they are given, and that if the exhibitor does not approve of the giver's conditions, he need not compete? Unfortunately, the whole question of medals is brought up by the servant, who really has no *locus standi*. The medal-giver is the master, and has a right to dictate conditions. In our own competitions we now allow no photographs to be entered *which have been exhibited at any competition or exhibition*, and we can secure from, say, 50 competitors, 500 pictures that fulfil our conditions; but the restriction we suggest in general exhibitions, is that when once the picture is medalled it *never* is awarded another; but if a man has only one picture, he can exhibit it at any number of exhibitions until it does obtain distinction for him.

* * * *

WE are pleased to notice that the Lantern Society has been started. The executive have been good enough to forward us a copy of the rules, from which we notice that the subscription for town members is one guinea, entrance fee one guinea, and for country members (residing outside a radius of twenty-five miles from Charing Cross) half a guinea subscription and half a guinea entrance fee. The entrance fee is not in force until after September 30th, 1890. There is really hardly any limit to the work that a properly organised lantern society can do for the furtherance of photography, and we expect great things of the pioneer society. Anyone requiring further particulars, or any of our readers who may be desirous of becoming members, should communicate with Lieut. C. E. Gladstone, R.N., 6, Bolton Street, Piccadilly, W.

* * * *

LAST week the members of the Liverpool Amateur Photographic Association held their first ladies' evening, which was a very pronounced success. An excellent concert was arranged under the guidance of two musical members, and Mr. Paul Lange delivered his very admirable lecture upon Norway, which was illustrated by 130 lantern slides from his own negatives. A very large audience was in attendance, and the first ladies' evening was a marked success. Yesterday (Thursday) the members held their general monthly meeting, when the arrangements for the 1891 exhibition were brought up for discussion. We shall hope to be able to lay the conclusions arrived at before our readers next week.

* * * *

THE Committee of the Newcastle-on-Tyne Photographic Association have decided to extend the time for "sending in application forms from April 1st to the 7th, but all pictures must be in the hands of the Secretaries by the 10th prox.

* * * *

WE are pleased to make known the formation of a photographic society, confined to amateurs, in connection with St. Bartholomew's Hospital. The chief object in view in starting this society is the "application of photography in the study of medical science." No less than thirty members have been enrolled.

* * * *

WILL all those who kindly allowed us the use of their "Dark-rooms" last year advise us of any alterations? We are just about to revise and augment our list. We require the use of a "Dark-room" in EVERY SEASIDE OR TOURIST RESORT IN THE UNITED KINGDOM. Professional photographers and dealers in photographic apparatus are

asked to allow us to include their "Dark-rooms" in our list, and to state whether a charge is made for changing plates, developing, etc., and what plates, etc., are stocked. We shall put ourselves in communication with them in a few weeks time. In the meantime suggestions will be gladly received, and we shall be glad of help to bring our "Dark-room" list up to 1,000 towns. Everyone can help, both amateur, professional, and dealer. To the two latter it means business, to the former intercourse with "contemplative men" in pursuit of "modern recreation." We shall take every care as to introduction, and no one will have the right to expect to be allowed to use of the "Dark-rooms" in towns as per our list without our personal introduction.

* * * *

PERSPECTIVE AND LENSES.

A SHORT time back, it was our good fortune to be present at a meeting of the "Artworkers' Guild," when the subject chosen for discussion was the "Use of Photography to Artists." As was perhaps only to be expected, photography did not come in for any very high share of praise, and the general consensus of opinion undoubtedly was that photographers generally were bad artists.

But in the remarks made by many of the members, they certainly laid themselves open to the *tu quoque* retort, that artists were very bad photographers. Indeed, we must confess that, considering the very great extent in which photography is now practised by artists, we were at first somewhat surprised at the general ignorance of the subject that was exhibited by most of those present.

This is partly no doubt ascribable to the mysterious and almost underhand manner in which painters generally practise photography; they appear to wish to conceal from the world generally that they are intelligent enough to utilise the powers that science has given them, and speak always of photography in an apologetic manner, like an upper schoolboy admits the use of a crib. This want of moral courage prevents them joining or attending the meetings of the numerous local societies, whose open discussions do so much to improve the general knowledge of the art, and makes them dependent for their technical knowledge on the mercenary advice of small and obscure dealers, whilst their acquaintance with the Art side is gathered only from specimens procured from peddling bagmen, in a manner suggestive that the prints in question hailed rather from Holywell Street than a public exhibition.

Looking on it in this light, it is less surprising that artists should not recognise the powers offered to them, and generally condemn a process of which they have but a shadowy knowledge.

Now, although adverse criticism is sprinkled pretty generally over the whole practice of photography, if there is one part which comes in for especial vituperation it is that most innocent article the lens. It is a good old saying that one abuses most what one does not understand, and artists abundantly prove the truth of this saw, and it would be difficult to show more ignorance of optics than they do in their remarks on the capabilities of a lens. Photographers also, we must admit, are not entirely free from these misconceptions, and even Mr. Emerson is hardly as clear on the point as he might be.

To take one typical specimen from the shower of abuse launched out against any photographic lens, we will examine that perhaps most common one, namely, the accusa-

tion that the lens exaggerates perspective, or diminishes the sizes of objects in the distance. We do not think any painter ever brought forth a homily on photography without sooner or later blundering into this misstatement, than which nothing can be more erroneous. It cannot be too clearly stated that in no way *can* any photographic lens distort or even alter the perspective of a view.

What there lies in nature before it, that, and that only, it represents with absolute fidelity on the ground glass. And when pictures showing distorted perspective are met with, it is not the lens that is to be blamed, but the operator, who, by getting too near to his principal object, naturally reproduces this in too large a scale compared with the distance, or else, from including too much in his picture, introduces objects that are too near to his camera, and consequently makes them unduly prominent.

We, of course, assume in this reasoning that we desire to represent nature as she is, and our motto is not *ars est celare naturam*. We are only too well aware of the tendency of the older school of painters to exaggerate the size of distant objects, and our galleries are full of most gross and glaring examples of the fault. This has not been without influence on the public, who have been thus gradually educated to like and expect these incongruities.

We think that when in the future the influence of photography on art is calmly discussed, it will be generally admitted that nothing was more marked than its influence on the rendering of perspective. And the public of the future will not recognise as an artist a man who emulates the Titans and piles Pelion and Ossa when he wants to delineate Primrose Hill.

And what is perspective, of whose laws painters now-a-days appear so very ignorant? It may be defined shortly as the art of reproducing solid objects correctly on a plane surface. And it may be practised by simply holding up a plate of glass between the view and the spectator, and then, keeping the eye and glass both fixed, carefully tracing the outlines of the view as they appear on the glass. We shall then get a true perspective rendering of the view, and it may be at once experimentally seen, as well as mathematically proved, that no alteration in the *relative* sizes of objects can be effected by any alteration in the position of the glass, providing the eye does not change. Their *actual* sizes will alter; that is to say, that the near gate will be represented larger or smaller, but so also will be the distant hills, and if the gate appear twice the height of the mountain in one position of the glass, it will appear precisely twice its height also in every other imaginable position. In fact, the only difference obtainable by moving the position of the glass will be to produce a smaller or a larger picture, as it is brought nearer to or removed farther from the eye.

And when we come to replace the glass plate by a dry plate, and our own eye by a photographic lens, we shall get exactly the same results, and find that plates taken with lenses of different focal lengths produce images, where the sizes of the objects in them are always strictly proportional.

Furthermore, it follows from the first laws of optics, that when dealing with parallel rays, that is, those emanating from fairly distant objects, the actual sizes of the images formed by a lens of a certain focal length will be exactly equal and similar to the image out-

lined on a plate of glass held at the same distance from the eye. That is, a lens of short focus gives a small picture, and one of long focus a large picture.

In other words, *n'en déplaie à messieurs les peintres*, the lens is no marvellous necromancing instrument, and is as incapable of falsely rendering what is spread out before it as these gentlemen should be.

And if we do meet with a photograph or a picture where an exaggerated perspective is to be found, we should no longer make a scapegoat of the innocent and servile lens, but blame rather the photographer or painter who had clumsily chosen an injudicious point of view, or included too wide an angle in his picture.

Letters to the Editor.

GAS CYLINDERS.

SIR,—Referring to "W. B. M.'s" letter in your issue of the 14th inst., and to your note at foot of same, inviting this Company to give its experience of gases compressed in cylinders, I have pleasure in giving you the following information, viz.:—Within the last three years we have compressed, approximately, three million cubic feet of gas, which (taking 15 ft. as the average capacity of cylinders) represents a total number of cylinders dealt with of two hundred thousand (of course, in this computation, if the same cylinder is filled twelve times it counts as twelve cylinders). You will be glad to know that, although such a large number of cylinders has passed through our hands, no accident has ever happened with a single one of them, either at our works or elsewhere.

A slight mishap once took place in consequence of a customer having amused himself by painting his oxygen cylinder red. When it arrived at our works it was taken to be a hydrogen cylinder, and was filled with hydrogen. The result was that when the customer received it back and began to use it, in the belief that it contained oxygen, the windows of the room in which he was working were blown out. The cylinder did not burst, and no one was hurt. The owner of the cylinder stated that he was ignorant of the fact that red was the distinctive colour of hydrogen cylinders; at the present time no one who uses compressed gases is ignorant of this fact, and a similar mishap is not likely to occur again.

You will, I think, admit that our experience with compressed gases is reassuring.

It will be noticed that, in spite of the very severe tests which the Scotch and Irish Oxygen Company applied to their cylinders, as noted in the extract from the *Glasgow Herald*, published in your last issue, they did not succeed in bursting a single one of them.—I am, Sir, yours faithfully, T. N. HESTER

March 19th, 1890. (Secretary to Brin's Oxygen Co., Ltd.)

SIR,—I think the explanation of the different action of water and gas on cylinders is explained as follows: At ordinary temperatures water is very slightly compressible, and has, therefore, very little elasticity. Supposing a cylinder to burst under hydraulic pressure, a rent occurs, a few drops of water escape, the expansive force of the water is spent. On the other hand, supposing gas, which is permanently elastic, or water at high temperature, *i.e.*, steam, is the cause of the rent, the elastic force of the gas or steam goes on acting indefinitely until all its force is expended, rending the cylinder to pieces and driving the fragments in every direction.—Yours, etc., G. H.

SIR,—In case no one with wider experience than mine writes to you about gas cylinders, you may consider this worth inserting. I have used cylinders twenty or thirty times this winter with Beard's patent regulators. Once these regulators went out of order, and gave me a very short supply of gas. They have worked perfectly on every other occasion. No doubt they are costly, but their use saves so much trouble in lugging about pressure boards and bags that it is quite worth while to invest in a

pair. My impression is that, barring the risk of gases getting mixed, which should be rendered impossible, cylinders are quite safe, but I shall await with much interest further contributions to our knowledge.—Yours truly,

R. C. MACLEOD.

March 14th, 1890.

THE CHALLENGE CUP.

SIR,—Enclosed is copy of letter which I have this day forwarded to Messrs. Peasgood and Wollaston, *re* the award in the Challenge Cup Competition at the Crystal Palace Photographic Exhibition. I shall feel obliged if you will kindly insert it in your next issue.—I am, yours truly,

EDGAR G. LEE

Newcastle-on-Tyne and Northern Counties (Hon. Sec.)

Photographic Association,

Newcastle-on-Tyne, March 21st, 1890.

Copy of Letter sent to Messrs. Peasgood and Wollaston,
Photographic Exhibition, Crystal Palace.

“Dear Sirs,—Confirming my telegram of 19th inst., I am instructed by our exhibitors, whose names are appended at foot, to formally protest against the award in the Challenge Cup Competition, on the ground that, from authoritative information in our possession, a portion only of our exhibits was brought under the notice of the judges. A large portion of our pictures having been excluded from the Competition, as we *know* to be the case, we hereby demand an explanation, and unless that explanation is satisfactory, we insist upon the entire Cup Competition being re-judged.

“A copy of this letter is being sent to each of the photographic papers.—I am, yours truly,

EDGAR G. LEE,

“Mosley Street Café, Newcastle-on-Tyne, (Hon. Sec.)

March 21st, 1890.

“EXHIBITORS’ NAMES.”

Auty and Ruddock.

W. Parry.

T. Galloway.

J. Pike.

J. P. Gibson.

H. R. Procter.

J. E. Goold.

G. H. Ridgway.

Edgar G. Lee.

Lyd. Sawyer.”

* * * *

CRYSTAL PALACE EXHIBITION.

SIR,—In your kind notice of my picture, “On the Grand Canal, Venice” (No. 1,189, Crystal Palace Exhibition), you say it is admirable work, due more to the paint-brush than the camera, and that it is not photography. Now, Sir, as neither the negative nor the carbon print have any brush work or retouching on them whatever, I think this is a very unjust criticism. The Manager of the Autotype Company will endorse my statement, and I shall be much obliged to you if you insert my protest in your next issue, as the mistake of your critic is likely to do me harm.—Yours very truly,

AUG. W. WILSON.

March 24th, 1890.

NOTE.—We have much pleasure in publishing this letter.—ED : AM : PHOT :

* * * *

SCHOLARSHIP.

SIR,—As an alternative to my proposal of last week, I desire to-day to make a suggestion, actuated thereto by a point mentioned in the discussion at the Camera Club Conference yesterday. I refer to the proposal to hold an annual exhibition of photographs on the lines of the Academy, or Salon, the only objection to such an exhibition being a want of funds. You, Sir, in a most ready manner, offered your aid in this matter, and I follow your lead, and the Britannia Works Co.’s gift of £100 per annum for three years is at the disposal of any representative Committee that may be chosen to carry out this object.

May I add that I heard at the Conference a considerable quantity of unmerited abuse thrown at traders in respect to medals, but not a word against the societies who received them. Now, in not one single instance, as far as my memory serves, did we voluntarily offer any medals, but the suggestion came from the societies themselves, and in many cases they would have fared badly without them.

Those high-minded gentlemen who so forcibly reprobated such practices will be glad to know they are at an end. Perhaps they will follow the humble efforts of “mere traders” in giving practical support to such suggestions as have been made, and then photography will be in a fair way to that desired elevation to a higher platform which “mere talk” has hitherto failed to effect.—Yours truly,

JOHN HOWSON,

Ilford, London, E., March 22nd, 1890.

CONSTRUCTION OF CONDENSERS.

SIR,—Mr. Groves asks two questions, in his letter to the AMATEUR PHOTOGRAPHER of the 7th instant. Perhaps the following may prove of use to him. In measuring distances from lenses the starting point is the optical centre: in a double convex lens of equal curvatures this point is in the centre of the lens, in a plano-convex on the centre of the convex surface, and in double combinations about where the diaphragm is placed.

Firstly. As to the position of the illuminant in enlarging. There are two positions generally used for this. One is where the object has to be illuminated by parallel rays; in this case, the lamp is placed at the principal focus of the lens. The other position, said to give the best results, is where the lamp and diaphragm of the projecting lens are conjugate foci, which is found as follows: Let F be the principal focus, p the distance of the illuminant to condenser, and q the distance between the diaphragm and the condenser, then:—

$$\frac{1}{p} + \frac{1}{q} = \frac{1}{F} \quad \dots \quad (1).$$

Secondly. What is the relation of the radius of the convex sides to the focal length? If Mr. Groves only wants to find the focal length, he can get it directly by experiment, by utilising the sun, which will give the solar or principal focus; or else by means of a candle or window, by No. 1 formula.

If, however, he wants it, in terms of the radii of curvature; in a double convex lens let r and q be the radii of curvature of each face, F the principal focus, and m the index of refraction of the material of which the lens is composed, then:

$$\frac{1}{F} = (m-1) \left(\frac{1}{r} + \frac{1}{q} \right) \dots (2).$$

If the lens has one side flat, then q becomes infinite, and the formula is:

$$\frac{1}{F} = \frac{m-1}{r} \quad \dots \quad (3).$$

The following are a few of the indices of refraction (m) referred to air as unity:

Water	1.336
Equal parts of glycerine and water	1.400
Glycerine	1.475
Chloride of cadmium in glycerine	1.500
Crown glass	1.525
Flint glass	1.575

These formulæ are approximations, and refer to lenses with a small angular aperture, and which are “thin;” that is, their thickness is small compared to the radii of curvature. They are, however, the usual formulæ, and lenses are modified more or less to suit them.

If, however, Mr. Groves is experimenting in making lenses, he will want more information, and the following construction of the path of a ray of light passing from one medium to another may prove of use. When a ray of light strikes a surface obliquely, it makes an angle called the angle of incidence (i) with the perpendicular to the surface, and on passing into it makes an angle of refraction (r) with the same line, then

$$\sin i = m \sin r.$$

When the ray strikes perpendicularly, this angle is zero, and there is no refraction.

Draw two parallels AB and CD, take CD as unity and make AB = m CD. For instance, for crown glass make CD = 2 inches

and $AB = 3$ inches, join AC and BD , and produce them to meet in E , then CD is the scale for glass, and AB for air.

Let XOX' be the axis of the lens, and OP part of the surface. Let the ray of light touch the surface at P , through P draw LPS , touching the surface at P , and draw WPR perpendicular to LS at P ; with centre P and any radius, draw a circle NSM cutting NP in N , draw NQ parallel to LS , and meeting WR in Q . Lay off AF equal to NQ , and join FE , then CH is the corresponding sine in glass to NQ in air. Draw MR parallel to LS and equal to CH , meeting the circle in M , and the line QR in R , join PM , then PM is the direction of the ray of light in glass. The same construction must be gone through when the ray passes out into air, using the same proportionate scale, only measuring off first on

CD . If several rays are drawn in this way, their intersection will give the focus, which will probably give a curve known as a caustic. A certain number will intersect approximately on the line XOX' . This point is what is known as the principal focus.

Of course, if preferred, the positions of the rays may be calculated by trigonometry.

For the above construction all that is required is a divided scale (preferably decimally), a pair of compasses, and a set square. —I am, etc.,

J. G. P. VEREKER.

* * * *

ALPHA PLATES.

SIR,—I have been trying the Alpha lantern plates, and have noticed that nearly every one of them has a defect in the way of finger marks or spots. A friend of mine has tried several packets of these plates, and has noticed the same defects. Both his and my plates were bought at different places. It seems a pity that they should be like this, as they give beautiful warm tones. I should like to know if any of your other readers have found them so. If they have not, it seems curious that the damaged packets always fall to my friends' and my share.—Yours truly,

A. H. LIVINGSTONE.

86, Palace Gardens Terrace, Kensington.
March 15th, 1890.

* * * *

"PHOTOGRAPHIC ANSWERS."

SIR,—In the last issue of the *Photographic Art Journal*, in consequence of our not having received a copy of *Photographic Answers* for several weeks, we expressed our belief that it must have expired.

We have, however, received a communication from our contemporary which removes any such misapprehension.

Photographic Answers is not only still in existence, but in a vigorous condition, and promises well, so that we desire to apologise for any misapprehension which we may have created.—Yours faithfully,

EDITOR, *Photographic Art Journal*.

* * * *

AMATEUR PHOTOGRAPHIC SOCIETY, EDINBURGH.

SIR,—In this week's issue of the *AMATEUR PHOTOGRAPHER* I observe a letter signed John Pirie, advocating the formation of an amateur society for Edinburgh, on the grounds that "the present society is encumbered with professionals, who are no help to amateurs, but whose presence is rather a drawback to amateurs expressing their views." A letter with the same object

in view appeared in your journal about two years ago, and was disposed of by the then Secretary of the existing society, and another correspondent, when it was pointed out that the present society was by far for the most part composed of amateurs, and such were the leanings of the society to them that it is a rule that the President be not a professional, and this rule has been acted on all the time that I have been connected with the society, now over fifteen years.

There is also a club, of a limited number, composed of members of the society only, which meets once a month, and there professionals and amateurs mingle in the most harmonious manner, each vying who shall give the most help and encouragement, and each standing for the time being on the same platform, and the same thing applies to the manner in which business is carried on in the parent society.

The conclusion I come to, and the opinion I have long held, is that the strength and usefulness of such an association lies in the fact that the two elements are represented, and therefore no need for another society on a purely amateur basis.

For myself, and I am certain I speak the sentiments of all other amateurs, the professionals are no "drawback to amateurs expressing their views"—the reverse is the case.

I need not encroach further on your space, but I should like to ask how it comes to pass that Mr. Pirie thinks that another society is needed because the present one is encumbered, etc., etc, when he can have no personal experience on the matter, seeing that his name does not appear on the roll of members of the Edinburgh Photographic Society?—Yours, etc.,

Edinburgh, March 22nd, 1890.

JAS. CRIGHTON.

SIR,—As one who has taken a quiet interest in amateur photography in Edinburgh for some years, allow me to support Mr. Pirie's letter of last week. Amateur photographers here are very small fry when sitting at an association meeting with their big professional brethren, from whose chance approving smile they may at times get encouragement. The sooner it is recognised that amateurs cannot run in harness with professionals the better. Mixed meetings seem only to lead to the aggrandise-ment of the professional. Amateurs here must join hands, organise their own society, and seek to progress by self-help. We are capitally situated in Edinburgh, and amateurs are a strong and growing body, and it is idle to say that a strong society cannot be formed. Let the amateur be up and doing, and get matters arranged by next winter.

Just another sentence. Why should not amateurs arrange summer excursion parties, and perpetuate on plates our beautiful scenery? Novices need coaching in our delightful art; but they are a bit too bashful, and go out solitary and alone. If parties were arranged, one could assist another, and the experienced artist the tyro. A word of experience in the ear of a beginner is worth ten experiments, which are always costly and often disappointing.—Yours, etc.,

WALTER MCPHAIL.

Edinburgh, March 22nd, 1890.

* * * *

PHOTOGRAPHIC SOCIETY FOR THE POTTERIES.

SIR,—There being no photographic society now in the Potteries, we have been asked by a number of amateurs at the north end of the district to take the initiative in forming one. It is intended to hold a preliminary meeting in Burslem at an early date. Those amateurs who would be willing to join are requested to send in their names to Frank C. Powell, The Grove, Wolstanton, or J. F. Hewitt, A.P.S., 35, Market Place, Burslem. Notice will be given when and where the meeting will take place.—Yours, etc.,

F. C. POWELL.

March 22nd, 1890.

* * * *

HAND-CAMERAS IN THE PUBLIC PARKS.

SIR,—As to Mr. Steele's letter, the law is simply this, that photographers, both professionals and amateurs, are not allowed to photograph in any public park. If Mr. Steele photographs there with a detective camera, it will be just as much against the law as with a tripod. But by sending to Her Majesty's Board of Works, he will be able to obtain a license (provided he is an amateur), which is not available on Sunday.—I am, yours truly,

JOHN H. MONTAGU.

Chemistry for Photographers.

By C. H. BOTHAMLEY, F.I.C., F.C.S.

(The Yorkshire College, Victoria University).

(Continued from page 177.)

Now that we have become acquainted with the more important outward signs of chemical changes, and with some of the chief conditions by which the occurrence of such changes is determined, it is necessary to ascertain whether we can distinguish between different *kinds* of chemical changes, and whether we can frame any useful system of classification for them.

EXPERIMENT 24.—Place a small quantity of red mercuric oxide in a dry test tube, and heat it. *Observe* that it darkens in colour, finally becoming black, and that a grey deposit forms on the cold part of the tube. Light a splint of wood, and when it has burnt for some time blow out the flame, leaving a glowing spark on the end. Introduce the splint with the glowing spark into the tube in which the mercuric oxide is being heated, and the splint will again burst into flame; repeat this. Now allow the tube to cool. *Observe* that the solid which is left (if any) regains its red colour as it cools, and examine the grey deposit formed in the cold part of the tube. Rub it together by means of a splint of wood or a strip of card, and on looking down the tube you will see that the deposit has collected in small shining globules with all the appearance of mercury or quicksilver; the deposit is, in fact, metallic *mercury*. The colourless gas which is given off and rekindles the glowing splint is called *oxygen*.

In this experiment we have obtained from mercuric oxide, by the action of heat, two substances—mercury and oxygen—very different from one another and very different from the original oxide.

EXPERIMENT 25.—Dissolve a few crystals of potassium chlorate in distilled water, and to the solution add a few drops of a solution of silver nitrate. If the chlorate is quite pure there will be no change, but with the ordinary commercial chlorate a *slight* white precipitate will be produced.

Take a larger quantity of the crystals, and heat them in a dry test tube. *Observe* that the crystals melt, and after some time the liquid seems to boil. Now introduce into the tube a splint of wood with a glowing spark at the end, taking care that the wood does not drop into the melted chlorate; the splint will burst into flame as in experiment 24. Continue heating until the effervescence of the solid nearly ceases, allow it to cool, and dissolve part or all of it in distilled water. To this solution add a small quantity of silver nitrate solution; a *dense curdy* white precipitate will be formed.

By the action of heat we obtain from the potassium chlorate, the same gas—oxygen—which we obtained from the mercuric oxide, together with a white solid substance very different from the original chlorate, because its solution behaves very differently with a solution of silver nitrate.

EXPERIMENT 26.—This experiment requires a galvanic battery and a special piece of apparatus, but if the student has not the means of performing it he should endeavour to see it done by some one else.

The apparatus consists of a glass vessel of the shape shown in fig. 12 (a glass funnel with the stem cut off will do), the hole being closed by an indiarubber cork through which, at a short distance from one another, pass two platinum wires to the ends of which are attached two small plates of platinum foil. The glass vessel A is nearly filled with water to which a small quantity of sulphuric acid has been added, and two long narrow test-tubes of equal

diameter and length are filled with the same acidulated water, and then by placing the thumb on the open end they are each in turn inverted in the water contained in A, and remain filled with water. One of the tubes is brought over one of the platinum plates, and the other tube over the other. The outside end of one of the platinum wires is connected by a copper wire with one of the poles of the

FIG. 12.

battery, and the outside end of the other wire is connected with the other pole. The electric current passes from one pole of the battery along the copper wire, platinum wire, and plate, through the water to the other plate, and along the other platinum wire and copper wire to the other pole of the battery. *Observe* that as soon as the battery is set in action by completing the connections, bubbles of gas begin to rise from the platinum plates, and gradually collect in the tubes placed above them. As the amount of gas increases, it will be seen that both gases are colourless, and that *the volume of gas in one tube is almost exactly double the volume in the other*. When one of the tubes is full, the other will be half full. Now disconnect the battery, place the thumb over the mouth of the full tube, lift it out of the water, and, still keeping it mouth downwards, bring it near a flame. Remove the thumb, and bring the end of the tube into the flame; *observe* that the gas in the tube takes fire and burns with an almost invisible flame. Remove the second tube in a similar manner; turn it mouth upwards, still keeping it closed, and then introduce a splint of wood with a spark on the end: the wood will burst into flame as in the previous experiments.

By the action of an electric current on water we obtain from it two colourless gases, oxygen, and a gas which will burn and which is called *hydrogen*.

Notice in the first place that the three preceding experiments show that substances which are very different may yet all contain the same substance, united, of course, with others. The red solid mercuric oxide, the white solid potassium chlorate, and the colourless liquid water all contain the same substance, oxygen. The other substance with which the oxygen is united, is, however, very different in each of the three cases.

In all three experiments the chemical change is of the same kind; from one substance we obtain two, different from one another, and different from the original substance. We have, in fact, three examples of *chemical decomposition*.

CHEMICAL DECOMPOSITION is the splitting up of one substance into two or more substances different from one another and different from the original substance.

In the experiments which have been made one substance split up into two, but in very many cases decomposition is more complicated, and one substance may split up into five or six others. The chief agents in the production of chemical decomposition are heat and electricity, as in experiments 24, 25, and 26, and light, about which we shall learn more subsequently.

All substances of definite composition which can undergo decomposition in the manner indicated, and yield at least two distinct substances, are termed *chemical compounds*.

All substances, however, are not compounds. If we take the oxygen or the mercury or the hydrogen obtained in our experiments, and endeavour by any means at present at our disposal to split them up and obtain from them something different from themselves, we shall fail. There are many other substances which behave in the same way, and have never been resolved into anything simpler. These bodies are not compounds; they constitute, so far as we can tell, the primary or fundamental form of matter, and they are termed *chemical elements*.

A **CHEMICAL ELEMENT** is a substance which has never been resolved into anything simpler, or out of which nothing has been obtained different from itself.

Observe that the definition does not say that an element *cannot* be decomposed, but simply that it *has not been* up to the present time with the means at our disposal. It has frequently happened in the history of chemistry that substances which for a long time have been regarded as elements, have, on the invention of more powerful methods of investigation, been shown to be really compounds. There is no reason to suppose that this may not happen again, and if it does the substance which has been split up will of course cease to be regarded as an element, but possibly the products into which it decomposes may constitute new elements.

Winter Work.—XXV.

By T. C. HEPWORTH, F.C.S.

PHOTOGRAPHY BY MAGNESIUM LIGHT.

(Continued from page 195.)

It must be admitted that flash-light portraits have too often a very unnatural appearance, and that the eyes in particular seem to suffer. One reason for this is that the flash is so unexpected in its brilliancy that the subject involuntarily closes his eyes at the moment of exposure, or at any rate as quickly as he can. The result is that, quick as that exposure seems, it has actually registered the image of the open eye as well as a superposed image of the closed eye. The effect is by no means pleasing, and gives a generally hazy appearance to the eye, which is apt to make the censorious ask whether before that picture was taken, the original had been dining "not wisely but too well." For this reason it is as well to direct the subject not to look at or near the source of light, nor directly towards the camera. It is always a good plan also, to make a preliminary flash without taking a photograph, so that the sitter or sitters will know what to expect, when the camera is ultimately used. Another

reason why the eye suffers in these pictures is due no doubt to the circumstance that the pupil is naturally much more dilated than it is in daylight, and that the controlling muscles of the iris have not time to act when the bright flash comes. We thus photograph the eye under unusual conditions, and need not wonder that it looks unnatural. While on the subject of the eye it may be as well to point out here that it is injudicious to subject it to the strain of these flash exposures more than is absolutely necessary. It is a wise precaution to wear a pair of smoke glasses, or those dark blue spectacles which are used by cautious electricians who have much to do with the brilliant arc-light.

There should be no difficulty in focussing for a flash-light picture if the room be lighted by gas. I am in favour of all the available gas lights being kept full on both before and during exposure, if only to prevent the sitters blinking their eyes when the flash comes, as they are likely to do when a sudden flood of light comes immediately after darkness. If there is not much light available, a candle can be held by the sitter in the same plane with his face, and its flame can be sharply focussed on the camera screen. When all is ready the slide can be drawn and the lens uncapped before the operator makes the flash, the slight preliminary exposure producing no effect upon the plate.

With regard to pose of sitter and general arrangements, let them be the same as those generally adopted for portraiture in an ordinary room, and let the magnesium lamp be regarded as a window from which the light is to come. On the other side of the figure some kind of reflecting surface must be provided, and nothing is better than a sheet, unless it be a screen made for the purpose. I have used such a screen with good effect, and it consists of a wooden frame stretched over with canvas, upon which is pasted white lining paper. The real purpose of the screen was for trying lantern pictures in a small room, and so it will be seen that it answers a double purpose.

What may be called a natural background may easily be arranged in a private room, and any number of accessories in the shape of flowers on fancy tables, Japanese screens, books and pictures are always available. Care must be taken that the strong shadow thrown by the magnesium light does not fall upon any portion of the background which will be included in the picture.

There is no particular object in taking portraits by flash-light that can be easily taken by daylight; it should be reserved for such subjects as cannot readily be obtained, in the absence of a proper studio, by more ordinary means. Children playing with pet animals, or in their night gear, or even in their bath form subjects of the kind which are attainable by flash-light. Pet animals too can be perhaps better taken by flash-light than by other means. Family groups engaged at their common amusements, gathered round the piano, playing chess, etc., will also form interesting subjects for this kind of work. The ingenious photographer will quickly think of suitable subjects, and will gladly avail himself of a means of prosecuting his favourite pursuit in the absence of daylight.

In photographing a group of persons, such as one may have the opportunity of doing at a fancy ball, or on the occasion of some private theatricals, a simple reflector is not enough, nor is one flash apparatus sufficient. The following plan will be found both convenient and effective. Employ apparatus of such a kind that a puff of air, after the kindling flame is lighted, will give the requisite flash. Let an apparatus of this kind be arranged on either side of the groups, both being at a height above the level of the sitters' heads, and let each be embraced by a sheet of tin bent into a quarter circle. Now connect each apparatus by means of an indiarubber tube, the two tubes meeting on a T piece of

quarter-inch bore which can be bought at any gasfitter's. Let the T piece lie on the floor with its still remaining open branch pointing towards the camera. Furnish this with another piece of tube long enough to reach to the back of the position occupied by the camera, and pull its further end over the nozzle of a common pair of bellows. All that now remains to be done is to light the kindling flames, see that each apparatus is charged with powder, and at the right moment give a puff with the bellows. By this means both charges will be inflamed at precisely the same moment, and the light given will be found to be quite sufficient to produce a properly exposed negative.

I have not much to say, regarding the development of a flash-light picture. I am certainly in favour of using as little pyro as possible, and not stinting the ammonia. Do not be afraid of the picture appearing quickly under such circumstances. Your endeavour must be to avoid hard chalk and soot contrasts, and these you will undoubtedly get if you use much pyro and are chary with your alkali. When you find that you have plenty of detail but that there is a want of density in your negative, then is the time to add more pyro, which will gradually give your picture the density which has been lacking. In cold weather be careful to use tepid water for making up your solutions, and you will quickly find a benefit in so doing.

(To be continued.)

Photographic Printing Processes. No. IX.

BY ANDREW PRINGLE.

GELATINE-CHLORIDE EMULSION PAPER. "ARISTOTYPE," OR OBERNETTER'S.

THE printing processes known as "Aristotype" and "Obernetter's" are practically the same, and for certain purposes and to certain tastes the processes are so valuable that my series of chapters on printing would not be complete without more than mere mention of the names. Those who have a fancy for high gloss on their finished prints will find every facility for its attainment in the use of this gelatine paper; extremely thin negatives may be made to yield very fair prints by it; the tones attainable are various, and some of them very pleasant. But I do not think that an Aristotype or Obernetter print unglazed will ever be considered a thing of beauty; the surface in the unglazed condition is "soapy-looking;" and the tones apt to be very crude. The prepared paper—ready sensitised—will keep good for a considerable time, many months, for instance; and, so far as I know, the toning is not perceptibly more difficult or different in operation after prolonged keeping of the paper. The process of printing is rather more rapid than with ordinary sensitised albumen paper, and the same general principles are to be observed, the same dodges are available, with the gelatine as with the albumen paper.

The emulsion with which the paper is coated consists of silver chloride and gelatine, with a certain proportion of an organic silver salt. The general tendency of the emulsion is to yield plucky or even hard prints; as a rule, it will be found impossible to get a harmonious print from a negative showing marked contrast unless the dodge given under "Albumen Printing," under the name of "sunning down," be used. This dodge consists simply of printing to nearly the full required depth, and then allowing the light to act on the print held in the hand outside the printing frame. If this be carried out properly, a "chalk-and-soot" print may be greatly improved. Very thin negatives are to be printed

in dull light, or behind tissue paper or ground glass, and the worker may be astonished at the quality of result he may obtain by this process from an apparently useless negative. Printing is to be carried to nearly the same point as with albumen paper, but not nearly so far as with plain salted paper. The prints keep well in the dark after printing.

Two toning solutions, not altogether dissimilar in result though differently used, are recommended, and I find one as good as the other; on the whole, I find Dr. Liesegang's formula works better with his own paper (Aristotype) than with Obernetter's. Here is Dr. Liesegang's formula:

Water	24 ozs.
Sodium hyposulphite	6 "
Ammonium sulpho-cyanide	1 oz.
Saturated solution of common alum	2 ozs.

Dissolve; then twenty-four hours before using put into the solution some scraps of the sensitised paper. (This should not be omitted.) Then filter, and add:

Water	6 ozs.
Gold chloride	15 grs.
Ammonium chloride	30 "

This solution, of course, is at once a toning and a fixing solution.

The solution I use with Obernetter's paper is:

Ammonium sulphocyanide	140 grs.
Sodium phosphate	140 "
Sodium tungstate	100 "
Water	24 ozs.

(The tungstate or phosphate, not both, may be omitted and replaced by about half the quantity of the other salt; thus the phosphate may be replaced by 70 grs. of tungstate, making in all 170 grs. of tungstate.)

When dissolved, put in scraps of paper as before, filter, then add:

Gold chloride	15 grs.
Water	4 ozs.

After this toning solution a weak fixing bath should be used, say, 1 part by weight of hypo to 10 parts of water.

With Liesegang's bath no washing is formulated previous to toning, but I advise a bath of fairly strong alum solution in water. With Obernetter's paper the alum bath is almost necessary in warm weather or with warm solutions. It is better to use the toning bath quite cold, for it is strong enough to tone rapidly without any heating. The prints should be five minutes in the alum bath. I do not think that the warm tones obtainable by this process will ever meet with much favour, as in my experience, at least, they always appear rusty; but a brisk toning leads to a very pleasing range of colours, all more or less violet or blue-black. In the toning bath the prints *must* be kept constantly in motion, otherwise uneven toning will certainly occur; the dish must be large and the solution ample in quantity. No judgment can be formed as to progress of toning with this process by reflected light; the prints must be looked through against a fairly bright light, and toning is not complete while any brown or rusty appearance remains; the colour goes back considerably in the fixing bath when we use a separate one. The quantity of gold used in this process is considerable, and the toning bath's action will quickly become slower as prints are toned. After toning, the prints may be placed in clean cold water till a batch is ready for fixing, or if already fixed they are to be washed finally. The toning solutions formulated keep fairly well, but of course gold must be added as used up. It is better not to add the gold immediately before toning.

The washing of these prints requires great care, as hypo

clings with considerable tenacity to the gelatine. I recommend the rose-tap and squeegee, followed by a few hours in a washing machine. They may be dried and mounted with their own natural surface, but probably it will be better to squeegee the prints after washing to a ferrotype plate previously rubbed with talc, or to a sheet of glass prepared in the same way. A very high gloss indeed is given by squeegeeing to a talced and collodionised glass plate, the collodion solvents being previously washed out.

This process is well worthy of the attention of those who practice photo-micrography or any other purely scientific branch of photography. I may safely say that whatever shadow detail is in a negative will be brought out by gelatine-chloride printing, and considerably less detail is lost in toning and fixing operations by this process than by albumen paper printing. With this process, however, high-light detail is by no means so well rendered as shadow detail. As an instance of the utility of this process, I may cite the admiration lately evoked at the Camera Club by the exhibition of a set of prints illustrating skin diseases, produced by Dr. Radcliffe Crocker, and handed round on the occasion of Dr. Patterson's paper.

(To be continued.)

Photographic References.

BY MAJOR J. FORTUNÉ NOTT.

APPARATUS.

(Continued from page 104.)

Changing Boxes are light-tight contrivances, which can be substituted for "double-backs," and are made to contain any number of plates up to a dozen, which, by mechanical arrangements, can, in proper sequence, be placed in position for exposure. There are several forms of these changing boxes whereby a dozen plates can be carried and used without recourse being had to a dark-room, and that do away with the necessity, which otherwise exists if glass plates are employed, of carrying about six "double-backs," but despite their apparent advantages none of these contrivances have met with general approbation. A short experience in the manipulation of a changing box, especially if it be one adapted for any of the large-sized plates, is all that is required to reveal the fact that it is very liable to get out of order. Its weight, when filled, is also a drawback against its use, which cannot be overlooked. Again, any slight error made in cutting the plates to the exact measurement will often throw the working mechanisms out of gear, and cause a "sticking;" or a slight chipping of the corners will do the same, besides rendering a serious scratching of the sensitive surface very probable. Then, again, the plates are more exposed to dust than they are in "double-backs," and a greater liability to breakage also exists. Before an investment is therefore made in a changing box, although it may look a very simple affair, some experience with it in a practical manner should be stipulated for, or a reliable report from an uninterested source should have been received.

Film Holder.—This contrivance is a simple and useful device, which is employed for the same purpose as a "changing back," when celluloid or gelatine films in cut sheets are being used instead of glass plates. It may safely be asserted that the use of these films, cut to size, would become much more general if some means existed whereby

they could be automatically "changed" before and after exposure. In the "Ferrero film carrier" this changing is made by the insertion of a finger and thumb through holes in a light-tight bag permanently attached to the side of the holder. The lid being opened therein, the fingers can draw out the exposed film, and place it in another department which exists in the box, without any light being allowed to enter. When this has been done, a fresh film is brought into position, and so on. It is very easily worked, but, of course, is not automatic. It is, however, when filled very light, the difference in weight between it and a "changing box" being chiefly due, of course, to the lightness of the films as compared with a similar number of the same sized glass plates. For travellers, therefore, who prefer to use these cut films this "holder" supplies them with the means of carrying a dozen or more in such a manner that they can all be easily exposed without trouble.

Focussing Cloth.—This necessary adjunct to a photographer's kit is almost too well known to need any description. It is employed for the purpose of keeping the focussing screen protected from any extraneous light reaching it, while the "view" is being focussed. If it were not kept darkened, the image on the ground glass would either not be visible or not sufficiently clear to enable this to be done correctly. The material used for this cloth is very much a matter of taste, some photographers preferring black velvet to anything else, partly, it may be surmised, to the fact that it is somewhat handsomer in appearance than any of the other suitable materials. Whatever make is chosen, the substance must be impervious to light. It should also be fairly large, so that it can be made to well cover the camera; and in windy weather allow the operator to button or tie it to the camera in such a way that he has ample room under it. A thin rubber cloth is now made in large sizes suitable for the purpose, and is, when everything is taken into account, probably the best material to select. It is not easily moved by the wind, and in wet weather, being waterproof, it affords a protection to the camera and adjuncts, a feature which in our uncertain climate is a virtue not to be despised. It has, however, some drawbacks; in hot weather it is almost impossible to remain long under it without suffering for want of ventilation, and under some circumstances it promotes condensation of the breath upon the focussing screen, which becomes troublesome. If not kept in constant use, the rubber exhibits a tendency to become dry and hard, or even rotten. A focussing cloth made of this material should, therefore, receive some attention, in order to keep it in a serviceable condition.

It should by no means be forgotten to have loops attached, or button holes made in the cloth so that it can readily be fastened down in the event of work having to be done in windy weather. The neglect of this precaution may be the source of more annoyance than can readily be imagined without practical experience thereof. A useful precaution is to have eyelet holes inserted all round the cloth, especially if it is one of the stronger makes. This simple arrangement permits of its being easily made into a bag in which a travelling kit can be wrapped, or stretched between supports on occasions when shelter from the sun or rain may be desirable. In fact, a focussing cloth of the right dimensions and material can be made to serve so many useful purposes that it is advisable to give it more attention than such a simple affair would at first appear to call for.

The well-known appearance of a photographer hidden away under a focussing cloth, with only the legs of the tripod, and his own lower extremities visible, has always been, from the early days of photography, a sight which

NOTE.—These articles will now be continued in every other issue. Major Nott was unexpectedly called upon to proceed to Egypt, hence the non-publication of the articles.—Ed: AM: PHOT:

has for certain classes a strong element of the ridiculous. Substitutes for the focussing cloth have, therefore, been sought for, and in one or two arrangements for this purpose the difficulty has been overcome more or less successfully. A number of thin wooden or rubber slats fastened together after the well-known manner of a blind, are made to cover the screen, and by lifting them alternatively any part of the plate can be examined. An ingenious arrangement has also been devised whereby a spiral wire frame, tapering from a base the size of the plate to a sufficiently small apex to hold a small compound focusser can be made to cover the ground glass, and so enable the desired result to be attained without the operator assuming any undignified position. By no device, however, which has yet been brought before the public notice can the same assured certainty in focussing, or the means of correctly arranging the picture, be so satisfactorily accomplished as by the aid of the simple but despised focussing cloth.

(To be continued.)

Camera Club Conference.

THE fourth annual Conference was held in the theatre of the Society of Arts on the 20th and 21st inst., under the presidency of Captain Abney; and in the hall below there was an exhibition of apparatus, and at the Club an exhibition of pictures taken by the members.

The President, in opening the proceedings, dealt with the question of colour photography, and pointed out that photography in colours was of ancient date, but that no process had been discovered for retaining those colours, and his opinion appeared to be that the discovery of such process was, to say the least of it, very unlikely. In conclusion he said, "It may be asked what am I driving at, and my reply is, that I think that the photographic spectrum curves of sensitiveness are analogous to the spectrum curves of colour-perception in the eye, or, in other words, that a photographic plate has, in reality, one, two, or three colour perceptions, and that all sensitiveness to other colours is due to only partial response of this vibrating molecule to wave-lengths, which differ slightly from those with which it is in accord. A study of the simple mixture of the natural salts favours this view, and I believe that by using this as a working hypothesis, a better understanding of the apparent vagaries in the extent of sensitiveness will be attained."

Mr. A. M. Rossi then proceeded to read his paper on "The Art of Drawing and Photography," the object of which was to emphasise the opinion he had already expressed in an article that had appeared in the PHOTOGRAPHIC QUARTERLY, that photography was of great assistance to the artist, and was capable of saving a large amount of time, by providing the outline which the skill of the painter was to fill in. As an illustration, he took the case of two young men—one well to do, who, having a liking for art, although not an artist, and not knowing what else to do, decides to become one; the other, a boy born in poor circumstances, but a painter, within whom lie dormant the instincts of a designer and an artist. The former devotes six or eight weeks to shading the head of a Vitelliano, stippling it with the point of the crayon and bread putty. The apprentice, with a piece of chalk, smeared with forms of all kinds every available space of wall he could come across. The Academy student was busy trying to win a scholarship for best drawing from the antique, and the little apprentice, getting hold of a photograph, traced it on a smooth piece of board at his master's shop, and with his master's paints he coloured it. It was a portrait of his employer, who, having detected him, instead of discharging the refractory one, sends him at his own expense to Heatherly's to join the evening classes. There he learnt in six months enough drawing to enable him to copy with exactness anything from the flat. The apprentice, encouraged, goes on to success, while the other, leaving his pictures, throws brush and palette aside in disgust. Mr. Rossi concluded by expressing the opinion that the only teachable part of art, viz., drawing, was sinking with the rising of photography, and that the days were not far off when a youth, born with artistic instincts, with a few months of mechanical instruction could be his own teacher, and photography would be his academy.

Mr. Adcock thoroughly agreed with the opinion of Mr. Rossi, and believed that those who pursued photography for what at they could get out of it would find it a treasure.

Mr. Davison doubted if Mr. Rossi's position was taken up by many artists of the orthodox type. Mr. Rossi had referred to nine years as the period of the education of an artist; he thought that was not more than was necessary for the education of a photographic artist. He could not think that photography would help the artist, as the technique was different in both cases. The illustration of the two young men did not make for the reader's argument at all. The difference between the two cases was that one was an artist and the other was not; and the former attained excellence in spite of using the photographs, and would have been all the better for the education received by the other.

Mr. A. R. Dresser said Mr. Rossi referred to the photograph as a line drawing, and not as an art drawing, to be used for the purpose of the outline only. He also said that the apprentice was an artist, and that photographs only assisted him in his work.

Mr. Newman said a man must be an artist before a photograph was any use to him, for nobody could know better than he did the difficulty of copying a photograph. A photograph, too, might recall to the artist's mind passages which he might otherwise forget, though it might not teach him to draw.

Major Nott said there were few trades and professions to which photography was not now useful, and they had the word of an artist that it was useful in his own. Mr. Rossi said that the photograph was useful for giving the outline to a man who had not the power of accurate drawing. To his mind photography was one thing and art another, and he had not yet seen that the two met in any way whatever.

Mr. Rossi said he must emphasise the fact that photography was useful to art, especially in giving outlines to men who had not received an education in drawing. The apprentice benefited by the photographs because he had not that education, but no doubt he would have been all the better for the education. There were few great artists now who had not every photographic appliance, and who found the hand-camera a great use in getting records of groups of children and so on which they would otherwise lose.

The President said he was not going to agree that it took nine years to produce a photographic artist. He had worked at photography for nearly a quarter of a century, and it was very galling to find, when he entered his pictures for competition, that a man who had learned photography, as he called it, for six months took off the best medal. Mr. Davison might be a standing example of the nine years' apprenticeship, but he did not think he was. If a real artist chose to use a photograph it was perfectly legitimate.

Mr. Dallmeyer read a paper on "Limitation in the Treatment of Subjects by Focus," illustrated by a series of reproductions of photographs, showing the difference in the result of sharp, short, and long focus; and the conclusion he arrived at was that in the case of normal vision an object could be seen much sharper by a good lens than by the most perfect eye.

Major Nott said that in a stereoscopic slide he had recently seen of the interior of a cathedral he was able to tell marble from alabaster, and even the ages of the various pieces of alabaster, the gradations of colour were so well given. On examination by a glass he came to the conclusion that that was due to the absolutely sharp focus of the picture, one not so sharp not giving the same effect.

The President said if there was anything which would give absolutely correct perspective, it was a pin-hole. It was right that pictures should be taken absolutely sharply, because, in the case of large pictures—20 by 15—the eye looking at the principal point saw the rest of the picture out of focus in the same way as in nature itself.

Mr. Davison said gradation was not in any way a matter of focus; a pin-hole would give all the gradation of grass, rippling water, etc. Anything which rendered detail so finely as Major Nott had spoken of introduced considerations entirely different from those in the artistic mind. The artist did not want to know the difference in the looks of trees; the facts he had to depict were far deeper, broader, and wider than that. The whole question, however, was one for discussion, and some time was required for its consideration.

A paper on "Eclipse Photography" was then read by Mr. A. A. Common, F.R.S.; and Mr. W. T. Wilkinson gave a practical demonstration of the Collotype Process.

The Conference adjourned till the evening, when a lantern exhibition was given in the theatre.

FRIDAY'S SITTING.

Mr. Davison read an official communication from the Camera Club on the subject of regulations for photographic exhibitions. The following are the chief points of the communication:—

Introductory.—It has been pressed upon the Executive of the Camera Club that the matter of the better regulation of photographic exhibitions was one upon which the Club should make some pronouncement, and that it was advisable at this stage to carry further the action already taken in 1888, when, at a representative conference then held, a series of majority resolutions were adopted, and a number of influential opinions brought together in comparison.

The present action is taken in the hope that uniformity may be assured in the adoption of a code of regulations for future exhibitions.

Exhibitions appear to have taken a deep root in the world of photography, and the growth has been phenomenal. From the social and commercial, if not from the art view of photography, the effect of these exhibitions has been, and is, very considerable. They have taken their place naturally amongst photographic institutions and enterprises, and have given considerable stimulus to the popularity of photography, the increase of societies, and the growth of trade. It was but natural that in such a rapid and extended growth some weaknesses should have discovered themselves.

The object of the present movement is to make such suggestions or proposals as may aid in removing the more glaring of these defects.

The Camera Club has decided, therefore, to put forward the following rules for the conduct of open competitive exhibitions organised under the auspices of photographic societies:—

1. The following rules shall be known as the Camera Club Rules.
2. No prizes, medals, or awards offered for advertising purposes shall be admitted.
3. The names of the judges shall be announced upon the prospectus, or at least fourteen days prior to the date fixed for entry of pictures.
4. Exhibits shall be divided into two sections—an art section and a science section.
5. In the art section there shall be no classification whatever.
6. In the science section the classification shall not be restricted.
7. The number of awards shall be left to the judges.
8. Awards shall be all of equal value.
9. The Board of judges for the art section shall consist of men of recognised artistic ability.
10. In the science section properly qualified experts shall be appointed as judges.
11. All work in the production of the picture—selection, exposure, development, and printing—shall be done by the exhibitor.
12. That champion classes be abolished.

As recommendations, the Club desires to put forward the following suggestions:—

(a) That the power of rejection of inferior entries should be rigidly exercised.

(b) That with reference to Rule 6 greater effort should be made to encourage the exhibition of photographs, specimens, etc., illustrating the application of photography to: (i.) Astronomy; (ii.) Meteorology; (iii.) Microscopy; (iv.) Architecture and Engineering; (v.) Reproduction of Pictures; (vi.) Process Work; (vii.) Physiological; (viii.) Medicine and Surgery; (ix.) General Industrial Purposes (Linen, Lace, Pottery, etc.); (x.) Topography; (xi.) Geology; (xii.) Archaeology, etc.

(c) That retouching be declared.

(d) That proper and full provision be made for re-packing pictures for transit.

(e) That a small charge for wall space—minimum, 2s. 6d. for ten square feet—be made.

(f) That the number of photographs sent in to any one section by each exhibitor be limited.

(g) That each photograph in the art section shall be separately framed.

Whilst recognising that different possibilities are open to the organisers of exhibitions in large towns as compared with those opened in many provincial centres, the Club is of opinion that the chief recommendations urged would in no way affect the prosperity of the exhibitions, whilst their standing would be considerably raised.

The frequency of exhibitions is often referred to as the cause of many of the difficulties attending the system in general, and the Club cannot help recognising that the uninterrupted state of competition is fatal to originality and good work.

It is desired specially then to urge (i.) the rejection of inferior work altogether, (ii.) Reduction of awards, (iii.) Reduction of

classes, (iv.) Dispensing with advertisement awards, (v.) Greater attention and enterprise in stimulating scientific and industrial applications of photography.

In the art section the considerations which should weigh in regard to judging, classification, awards, framing, and hanging should be based purely upon artistic grounds.

Any distinction between amateur and professional in photographic exhibitions is considered absolutely unnecessary and greatly to be deprecated.

The Club looks forward to a time when it may be possible to dispense with awards entirely, and would approve of an exhibition in which no medals were offered, but in which greater stringency was exercised by the committee of selection, so that the honour of being hung would constitute an award.

Mr. Davison also read extracts from a number of letters from well-known photographers and societies upon various points in the paper.

The Rev. F. C. Lambert began by expressing a general concurrence with the paper, and then proceeded to give the points on which he did not agree with the Club. He thought there ought to be classification in the art section, or otherwise the work of the judges would be largely increased. He was strongly of opinion that it was undesirable to ask editors to be judges. In Rule 11 he was sorry that retouching was omitted; he would prefer that it should read, that all the work from the selection of the picture to the mounting should be the work of the exhibitor. He agreed with the abolition of the champion class if it meant that no picture was to receive more than one award. He would suggest further, that there should be a time limit; say no pictures were to be exhibited which were taken before the year last past, and that the number of exhibits should be limited. It would be better if the recommendation at the end suggested that the award should be made chiefly on artistic grounds, otherwise technical merit would disappear.

Mr. Charles W. Hastings said the question was whether the provincial societies could fall in with these rules. He had, however, a suggestion to make which might be acceptable all round. It was this: That a Permanent Exhibition Committee be constituted in London, the members to be drawn from the Council of the Photographic Society of Great Britain, the Camera Club, the Presidents of provincial societies, the Editors of the Photographic Press; and that there should be an annual exhibition held in London; provincial exhibitions to be held once in three years; that the United Kingdom be divided into thirty-six districts, and local exhibitions held, say, once a month; that the local exhibitions be under the control of local committees acting under the instructions of the permanent Committee; that no picture take a second prize at any exhibition; that permanent judges be attached to the Permanent Committee, but not necessarily resident in London. To carry out this scheme, funds would, of course, be necessary, and he could say that if it were adopted, instead of giving medals as he had done, he would be pleased to make an annual contribution to the funds. He was not at all sorry to see that there was a feeling arising in the country that editors ought to be relieved of the labour of judging.

Mr. Welford said Mr. Hastings' scheme came upon them as a surprise, and therefore he would not deal with it. Speaking as representing the provinces, however, he was convinced that it would not be safe to pass the suggested Camera Club rules. It was true photographic exhibitions were held in the provinces to aid photographers to see good work, but they were also for the purpose of educating the public to an appreciation of artistic photographs. It was essentially necessary that they should be a financial success, and such rules would prevent the exhibitions being held. He quite agreed that some improvements were needed. A journalistic position should debar editors from judging, and he agreed with Mr. Hastings that they would be glad of the relief; it would enable them to criticise more freely. To say there should be no classification in the art section was too sweeping a change to make at the present time, and would be too much for even the best judges they could get in the provinces. He could not see that any good was done to art by drawing a distinction between amateur and professional.

Mr. A. Maskell was opposed to any system of prizes or awards, and suggested the establishment of an annual Salon, or Academy, the prizes in which should be the places of honour on the walls. The hanging committee must be composed of men whose names would give absolute confidence to the exhibitors.

Sir David Salomons objected to landscape and portraits being considered under one head, and pointed out that considerable difficulty on that point had occurred at the Crystal Palace Exhibition. Tradesmen's medals were positively dishonest, and he had ceased to purchase goods from firms offering them. Technical and artistic merit should weigh equally in the judges' minds. There were many photographers who held that retouching was absolutely necessary, and he was of opinion that it should not be a disqualification.

Mr. Trueman Wood said that Pall Mall had practically adopted the no classification principle. He agreed with Mr. Lambert that retouching should be included in the work done by the exhibitor. The suggested abolition of the champion class required further consideration. He would suggest that the rules be referred back for further consideration in the light of the present discussion.

Mr. Davison pointed out that the rule leaving the number of awards to the discretion of the judges did away with the objections to no classification in the art section. With regard to the champion class, the Committee rather thought that point would be further considered, but certainly one picture one award would not meet the necessities of the case so long as the competitive system was adopted, as several well-known photographers only produced two or three works in the year, and they would not send them to exhibitions "not for competition." As to the suggestion that the word "purely" should be altered to "chiefly," that was unnecessary. Take a picture which should give the effect of a rainy day. If it gave that effect, it would be artistic and technically correct; if the technique were bad, it would not give the desired effect, and would not be artistic. Some of the suggestions of Mr. Hastings were very good, and that gentleman had certainly sprung upon them a very interesting set of suggestions which were worthy of consideration. He did not think that non-classification would affect the success of provincial societies. He would be delighted to see an Academy, or Salon, as suggested by Mr. Maskell. He hoped the suggestion to refer the rules back would be adopted.

The President said he had a very strong opinion of his own, but was not going to express it. He thought Mr. Hastings' scheme might be very admirable, and probably was, but there was the question of funds and annual subscriptions, which might not be so easy as Mr. Hastings seemed to think. Mr. Maskell had suggested that neither art nor science papers took any notice of the meetings of photographic societies. In the case of the Photographic Society of Great Britain that was entirely its own fault; the members complained that the papers were too scientific, and the Press judged them by what the members said of them. He would not put the rules to the meeting as a question, but ask them to vote on the point whether or not they be referred back to the Sub-Committee for further consideration.

The Conference unanimously decided that the rules should be referred back.

Lord Rayleigh read a paper on "Photography by the Electric Spark," which process he had applied to the purpose of securing photographs of a falling stream of water, the object being to show the effect of electricity on the water. By means of the optical lantern, it was shown that a small stream of water thrown vertically in falling gradually separated into numerous drops which separated widely. On exciting a piece of sealing wax, and approaching it to the seat of sensitiveness of the stream, it was observed that the drops, instead of spreading widely in small drops, amalgamated into fewer and larger drops.

Mr. Wollaston asked if those experiments did not explain the large drops of a thunderstorm.

Mr. Trueman Wood said he had repeated Lord Rayleigh's experiments made before the Royal Society, and he was astonished to find how difficult it was to get the image on the plate. He found that although the light was very high in intensity, it was very small in quantity, and he had to concentrate the light of the spark on a very small area before he could get any image at all. He also found that if the spark were allowed to pass directly across the plate it left a path, but only fogged the plate about a quarter of an inch on either side of the path.

Mr. Turner asked Lord Rayleigh if he had ever photographed drops falling on to a flat surface?

Mr. Eder asked if coils would not increase the brightness of the spark.

Sir David Salomons thought that method of photography might be applied to the observation of the secretions of spiders, silkworms, etc.

Mr. Wollaston asked if Lord Rayleigh had estimated the duration of the spark?

Lord Rayleigh, in replying, said no doubt electrification was connected with the large drops of a thunderstorm, but it was difficult to apply the explanation, as it might be that the amalgamation might be due to non-electrified drops being electrified by the discharge, or to highly electrified drops—which nominally repelled each other—being made less electrified by the discharge. To photograph falling drops was much more difficult than the experiment he had tried, as it was most difficult to get the spark at the precise moment at which the drop reached the plate. He did not think the coils would increase the light; the more rapid discharge would probably give the more brilliant light. He had not tested the duration of the spark, but a very weak discharge had been estimated to produce a spark lasting as little as the 1,000,000th of a second, while more powerful ones would probably last for the 100,000th to the 10,000th of a second.

The President said the print on a piece of paper revolving several thousand times a second had come out perfectly distinct on a daguerreotype plate. He had endeavoured to test the duration of the spark, and believed the result was about the 100,000th of a second. He thanked Lord Rayleigh for the lecture, and hoped it would not be his last communication to the Camera Club.

Captain Abney then read his paper entitled "A Photographic Untruth."

Mr. Trueman Wood, in proposing a vote of thanks to Captain Abney for his paper, remarked that he thought the members were in the same position as he himself—somewhat incapable of discussing the paper. He thought Captain Abney had alighted on a point that was extremely difficult.

Mr. C. H. Bothamley read a paper on "The Latent Image."

Mr. Spiller said that, owing to the lateness of the hour, it would be impossible to discuss Mr. Bothamley's very interesting paper. He believed that where the plates were exposed to the light bromine was really given off, but at the same time some gas was absorbed by the gelatine. He had, last summer, been over one of the largest plate manufactories in the kingdom, and had, he was confident, smelt bromine which was given off from large stacks of condemned plates, whilst being exposed to the light. With regard to the keeping of plates before developing, he had kept one for twelve months which had been developed satisfactorily, and he would like to ask members how long they had successfully kept plates before developing.

Captain Abney said that with respect to the smell of bromine he had nothing more to say, but he pointed out that something more than nasal proof was wanted to show that bromine was given off. He had almost proved that there was found in the image an organic combination which was destroyed by the action of heat. The subject of the "Latent Image" was a very difficult point, and he was glad that Mr. Bothamley had taken it up. There was one thing, however, he must say, and that was that Mr. Bothamley should not call his subject "Latent Image," but "Photograph Image." There was no such thing as "Latent Image."

Mr. Bothamley, in reply, said he knew it was usual to say that bromine was given off when silver chloride approached the light, but what he contended was that it was not known what was given off.

Captain Abney having proposed a vote of thanks to Mr. Bothamley,

Mr. W. T. Wilkinson then read his paper on "Photogravure Practically Illustrated."

The annual dinner was held in the evening at the Frascati Restaurant, under the presidency of Captain Abney.

CRYSTAL PALACE PHOTOGRAPHIC EXHIBITION.—Mr. Frank M. Sutcliffe writes, "The flash-light photograph of the Marchioness of Abergavenny's Lancers, which your critic upon the Crystal Palace Exhibition speaks of as one of my works, was, I understand, exhibited by Mr. H. J. Godbold, 8, Grand Parade, St. Leonards-on-Sea. As the photograph is, I believe, a successful one, perhaps you will kindly correct the mistake in your next issue, that the honour may be given to whom it is due."

Our Contemporaries at Home and Abroad.

L'Amateur Photographe (Paris) gives the following reducing-bath for negatives: Place the negatives in water for half an hour, and then in a bath of 100 parts of water, four parts sulphuric acid, six parts of 30 per cent. solution of bichromate of potassium. The action of the bath is very energetic, and should be carefully watched. The reduction takes place very uniformly, and no discolouration of the negative takes place. The negatives [so reduced can, if desired, be subsequently intensified. Articles: "Collodion Dry Plates and Gelatino-bromide Plates," "Photography and its Industrial Applications."

Wilson's Photographic Magazine, speaking on "Photographic Groups; Some Hints upon Them," says, "The truly universal principle of good compositions, if there is one, seems to be a certain sinuous sway of lines, and a harmonious connection of things with one another, that balances mass with mass, and gives that indescribable sense of satisfaction to the eye in passing from one to another. This is what we feel, rather than any cold and mathematical arrangement of symmetrical pyramids or complete and uniform circles. It must be much more felt than done by rule. The trouble lies in taking these abstract formulæ as rules. Any plate of the Crucifixion, for instance, by the old masters, will show how thoroughly covered up, and modified, and transgressed they have been." Articles: "To Catch a Speaker's Gestures," "An Apparatus for Cutting off the Lighting in Parts of a Landscape," "Practical Interpretations of the Laws of Conjugate Foci," "Faith, Hope, and Charity," "A Ray of Light thrown into Darkness," "A Photographic Stone-etching Process," and "Group Prizes" (illustrated).

The Deutsche Photographen Zeitung (Weimar) contains an article by Professor Schirm on "The Magnesium Flashlight in Photography," and also a description of Voightländer's Iris diaphragm shutter.

Photographic Globe (New York), the first number of which is just issued, says, "We have reached a climax in plates and their developing agents with which we are satisfied; let us turn our attention to another side and perfect the method of silver printing. . . Why cannot we buy prepared paper which will print in a reasonable time and fix and tone as rapidly as plates are developed and printed. It is true that process printing has been brought to an admirable point, but the photographer could not go to the labour entailed, to say nothing of the expense involved, to reproduce a dozen portraits or less. What we want is paper which will print and tone with less preparation and trouble than at present, to produce results equally good or better." Articles: "Toning Aristotypes," "The Simplicity of Development," "The Survival of the Fittest," "Professional versus Amateur," "Blisters," "Brilliant Prints," and "The Photographic Fad." The frontispiece is a print from a negative by E. C. Dana.

The *Photographic News*, speaking of "Aluminium in Photographic Apparatus," says, "The alloy likely to be most useful in photographic apparatus must be one not seriously above the weight of pure aluminium, and a good one for the purpose consists of ninety-five per cent. aluminium and five per cent. silver. We have reason to suppose that some of the aluminium now used in photographic good on sale in the market is slightly alloyed with another metal, which we guess to be possibly silver. An aluminium-silver alloy in the proportions just stated possesses, according to Tissier, an elasticity which is wanting in the pure metal, also a greater hardness and capability of being polished. An alloy of aluminium with German silver has excellent physical properties, and as this alloy is in the market, it may probably be that used in the portions of photographic apparatus. Any alloy of real silver and aluminium is attacked somewhat by sulphur." Articles: "The Crystal Palace Photographic Exhibition," "Photography at the Royal Meteorological Society," "Photography in Natural Colours," "Chromo-Photography by Block Printing," "Another Photographic Survey," "Sizes of Photographic Plates," "People with Double Faces," "Modified Collodion Emulsion," "Grade in Professional Photography," and "Celluloid or Cello-lonite?"

Anthony's Photographic Bulletin (New York) says, "In regard to the matter of flash powders, we must continue to protest against the use of any magnesium powder that contains any

oxidizing material added to facilitate the combustion of the metal. Those of our readers who think we are too severe upon these powders should read the little pamphlet on 'Flash Powder Explosions,' written by Dr. Charles Mitchell, of Philadelphia, in which the author states that all forms of flash-powders are dangerous. And we know of a number of minor accidents that have never been reported in the journals, where burnt hands and faces testify to the extreme danger attending the use of all flash powders except those made with pure powdered magnesium metal alone." Articles: "Where to Photograph," "The Chemistry of Uranium and its Salt, and their Behaviour in Photography," "How to obtain thoroughly Clear Gelatine Negatives," "The Silver Printing Bath," "The New Benzoline Limelight," etc.

The *American Lithographer and Printer* (New York) contains descriptive articles on "Half-Tone Etching," and "Photo-Lithography, and the New Albert Photo-Lithography Transfer Paper."

The *British Journal of Photography* says, "It is a matter of comment amongst the votaries of our art science that the light we have had during the past month or more, has been, in actinic quality, far in excess of what is usual at this season of the year. Its immediate effect is most noticeable in negatives taken by amateurs with shutter exposure. For months past the majority of these pictures, we learn from those who develop large numbers of 'amateurs' negatives, have been little better than silhouettes through under-exposure. Now, however, similarly timed, they show a certain amount of detail even in the shadows. It is no unusual thing for inexperienced amateurs or beginners to use the shutter with the same rate of speed—generally the quickest—for all subjects, quite regardless as to whether the light is good, bad, or indifferent, with the result so frequently met with in amateurs' work of this case." Articles: "The Fading of Prints," "Scientific Appliances for the Lantern," "A New Form of Albumen," "Density in Negatives for Enlargement," "The Art of Retouching," "Stereoscopic Matters," "Reducing Agents," etc.

The *Photographische Rundschau* (Vienna) contains articles on "In the Land of the Pharaohs," and "P. Mössard's Cylindro-graph," a new form of camera. The current number contains several illustrations, one being a magnificent collotype of a bunch of flowers taken on an orthochromatic plate, and it is difficult to believe that even a direct print from the negative could be better.

Photography, in an article on "Eikonogen," says, "There is a general idea that ammonia is not a suitable alkali to use with eikonogen, and many observers have testified to the truth of the notion. It has, however, lately been stated that ammonia may be used, and that many have been successful with it. If the drawbacks to its employment have been got over, it remains to be shown in what way ammonia is superior to sodium carbonate, because for practical use we do not wisely adopt what can be made to serve, in spite of its disadvantages, instead of that which is to all intents and purposes free from drawbacks." Articles: "The Camera Club and Exhibition Matters," "Life-sized Transparent Positives," "Experimenting with Oxygen Cylinders," "The Crystal Palace Exhibition," etc.

The *Photographic Times* (New York), in an article on "Photography as an Aid in Medicine," says, "A question may arise, 'Is it well for the amateur to develop and print his own pictures?' The answer I would give to this is, he should always do the developing, as by this means he learns whether he is giving correct time of exposure or not. As regards printing, that had better be given to a professional, as it requires a good deal of time and patience without sufficient compensation." Articles: "How to Calculate the Speed of a Shutter," "A Successful Woman Photographer," "The Old versus the New," "Photographs Plain or Coloured," "Photographs as Evidence," "Copyrighting a Pose," "Gelatine Lantern Slides," etc.

The *Studio* (New York) contains three full page engravings, all showing excellent workmanship, and the articles are on the "Address of Mr. W. M. Chase before the Buffalo Fine Arts Academy," "Robert Browning's Funeral," "A Bust of Tiberius," "Böcklin and his Newest Picture," "Eustache de St. Pierre," "The Last of the Dureal Gallery," "Another Cruikshank Find," "Translation from Horace," "A Monument to Jeanne d'Arc," etc. The readers of the *Studio* are promised at an early date a print from Robert F. Blum's etching from the picture, "The Lady

with a Rabbit," in the Gallery of Old Masters in the Yale School of Fine Arts. The picture is attributed in the catalogue to Francia, and is called, "A Portrait of a Princess of the Vitelli Family." The attribution may safely be questioned, but there can be no doubt as to the pictorial interest of the picture.

Science Notes.

SIR DAVID SALOMONS, a name well known in the photographic world, has given £1,000 to the Institution of Electrical Engineers, to found a scholarship of £35 per annum, to be held for three years, and be at the disposal of the Institution.

Messrs. Stengel and Markert, of Dresden, have lately issued an albumen of photographs, the work of Dr. A. B. Meyer, Director of the Zoological and Ethnographical Museum of Dresden, which contains thirty-seven plates, on which about 250 reproductions are printed. The subjects include all the types of the native population of the island of Celebes, in the East Indies, where Dr. Meyer has spent some time in the study of anthropology and ethnology.

Messrs. G. W. Bacon and Co., of the Strand, have just issued an admirable "photo-relief" map of Scotland (photographed from a model), which exhibits the mountains, etc., with a natural shading which cannot be produced so well in any other way. It is necessary to touch the map, in order to assure one's self that the surface is not in actual relief. This is an excellent application of photography.

The February number of the "Monthly Notices" of the Astronomical Society contains an excellent biography of Warren De la Rue (1815-89), the pioneer of celestial photography in England. He was attracted to this work by the daguerreotypes of the moon sent to the Great Exhibition of 1851, by Bond (U.S.A.) In De la Rue's early work he was assisted by Thornthwaite and by Howlett, and the photographs of the moon which he obtained with a 13-in. refracting telescope in 1857, stood a magnification of sixteen diameters. He was the first to obtain stereoscopic pictures of our satellite; and on his expedition to Spain to observe the solar eclipse of 1862, he obtained the first photographs of the red prominences, and proved them to be solar appendages.

During 1889 the sun was photographed at Greenwich Observatory on 190 days, and 410 of the photographs have been selected for preservation.

The automatic photograph machine, of which M. Cheron is the inventor, and Messrs. Salter, of West Bromwich, the makers, is, mechanically, a success. The victim gets on a stand 2 or 3 ft. from the machine, puts a penny in a slot, and looks intently in a small mirror just above the lens. The exposure lasts for a couple of seconds, when a small bell rings to indicate that "all is over." A noise of clockwork is then heard inside the machine, which indicates that the plate is passing through the developing, fixing, and washing baths. Then something is heard to drop into a small box in front of the machine, and on lifting the lid a portrait on a sheet of thin iron is seen—a "tintype," in fact. For a halfpenny dropped into another slot a gilt frame can be obtained. A party of capitalists as well as of Pressmen have been down to see the machine at work, and during this visit the machine "took" 200 photographs with complete success. It is able to take 300 before it requires re-charging. An electric light can be fitted for portraiture at night, if necessary. Patents for this machine have been secured in twenty-six countries.

About a twelvemonth ago, Dr. Hodgkinson, of the Royal Naval College, Woolwich, brought forward some evidence tending to show that the blackening of silver chloride on exposure to light was due to the formation of an oxychloride, the oxygen, of course, coming from the air. This view has been controverted by the famous American lawyer-chemist, Carey Lea, of Philadelphia, who gives instances where the blackening takes place when oxygen is not present. For instance, pure silver chloride was melted and poured into refined petroleum (a liquid devoid of oxygen), in which the silver chloride immediately solidified and lay at the bottom, being thus protected from the air. When the vessel containing the petroleum, etc., was taken into the sunlight, the silver chloride instantly blackened. Similarly the black photo-iodide of silver was obtained by the action of iodine, or pure silver, under petroleum.

To the new generation of photographers the name of Carey Lea is almost unknown. But the "wet collodion" men will remember him as the discoverer of the ferrous-oxalate developer in 1878, and as the American correspondent for many years of the *British Journal of Photography*.

The Ilford Company are following the lead of the AMATEUR PHOTOGRAPHER, for they offer a Scholarship for photography. An admirable means of disposing of such a scholarship would be to give it in connection with the annual technological examination in our science held by the City and Guilds Institute, the examiner being Captain Abney. An age limit should be adopted—say twenty-five. The winner should be required to devote one year, say, to work in England, at the Polytechnic, for example, one year in Berlin, and one year at Vienna under Professor Eder.

The business of making bore-holes into the earth in search of coal, etc., has now become almost a science, and the latest boring of this kind has reached coal under Dover at a depth of 1,180 ft. In connection with such attempts it is of the highest importance to discover the inclination or dip (if any) of the strata forming the sides and bottom of the hole. It would be perfectly feasible to lower a small camera, provided with a flash-light apparatus, actuated by electricity, and to obtain photographs at any desired depth. The Americans have been leading the way in this matter, and the *Philadelphia Times* states that the bottom of an oil-well 1,700 ft. deep and 6 ins. in diameter has recently been photographed at Warren. The bottom of the well had been enlarged by exploding there bombs filled with nitro-glycerine, and the photograph revealed a cavity 14 ft. broad and 7 ft. deep. "Has Nature any more secrets she would like to hide from inquisitive man? If so, they will need to be buried beyond the reach of the steel auger or the diamond drill. Into the deepest recesses which the drill can penetrate, the modern photographer stands ready to turn the broad light of noonday."

How curious it seems, this letting down of an automatic self-recording eye into the bowels of the earth!

An American photographer has patented a method of obtaining diffusion of focus—breadth without fuzziness—by using two diaphragms in the lens-tube, the first diaphragm being covered with a fine network of wire. The opticians will doubtless characterise this as "an ingenious expedient for spoiling the lens," and they will not be far wrong.

The month following the appearance of these notes will probably be the best in the whole year for instantaneous photography. Give your shutters a good overhauling—they will need it—and oil them carefully. Wipe your lenses with a little alcohol, and let your camera be thoroughly light-tight. Then sally forth on a warm April day, after a shower, keep the sun well over one shoulder, and you may use an aperture of $f/16$ and an exposure of the hundredth part of a second, and still find your plates "fully exposed." But you must use fresh plates; last year's stock won't do for such work. Reserve the old plates for "time" exposures. F. G. S.

FALLOWFIELD'S WEST-END PREMISES. — We are asked to announce that Mr. Fallowfield's West-end premises in Charing Cross Road are now nearly complete, and as soon as the show-rooms and warehouse are fitted up, the premises will be opened as a central depot.

BROMIDE PAPER. — A correspondent writes, "Would it not be an improvement if makers of bromide papers were to place a mark in a corner of the back, to distinguish the front from the back? A cross or possibly the maker's name would have the required effect."

LANTERN OBJECTIVES. — Mr. W. H. Jones writes, "I am obliged to Mr. T. S. Mayne for noticing my query, but he does not give me the information I require, namely, how would a disc 21 ft. in diameter, projected on a screen by a 6 in. focus objective, working at $f/4$, compare in brightness with a disc of 15 ft. diameter, thrown by an objective of 12 in. focus, also working at $f/4$? There must be some optical law on the subject, and this is what I desire to know. I quite understand that an opaque screen gives a much better effect than a semi-transparent one, and that a disc of 15 ft. diameter would be infinitely brighter than one of 21 ft. when projected by the same objective. I, however, think that in a hall of great altitude and length a 15 ft. disc looks very insignificant."

Societies' Meetings.

NOTE.—In this column the Editor can, of necessity, only give a brief summary of the proceedings. The PHOTOGRAPHIC SOCIETIES' REPORTER was established to report the transactions of Societies, and the Editor will be glad to receive reports for insertion as early as possible after the meetings have been held, and at the latest before the 24th of each month.

CARDIFF AM: PHOT: SOC:—The usual weekly meeting was held on the 19th inst., E. H. Bruton, Esq., A.R.I.B.A., in the chair. In response to the invitation of the Camera Club, after long discussion the following expression of opinion was requested to be sent *re* exhibition matters:—(1) That exhibition authorities should not decline prizes placed at their disposal for the purposes of advertising. (2) That the restriction as to number of awards should be left to the discretion of the Committee. (3) That the value of awards should be left to the discretion of the Committee. (4) That the suggested classification in the art sections should be as follows: (a) landscape, and landscape with figure, (b) figure subjects, (c) portraiture, (d) architectural, (f) lantern slides, same to be classed as indicated in previous sections, (g) enlargements, same to be classed separately. (5) That with regard to the selection and constitution of judges a list should be kept at the Camera Club of gentlemen willing to act in the different sections, and that editors of photographic journals should be excluded. (6) That it is desirable to announce the names of the judges at the earliest opportunity, same to be printed in the prospectus if possible. (7) That with reference to the working of the champion classes, this class should be restricted to pictures that have been medalled during the two years previous to the opening of the exhibition, and must not have been exhibited at any prior exhibition of the society. (8) That work by several should be eligible for competition, but this should apply to professional work only. (9) That judges should be requested to withhold awards in cases of insufficient merit. Retouching allowable. One subject one frame. Diplomas and medals. Separate classes for professionals and amateurs. Hanging committee should be appointed. One picture one class; if entered for two classes, duplicates to be sent. Mr. W. H. Kitchen delivered a lecture on "Enlarging." Mr. S. W. Allen, M.I.M.E., delivered a public lecture on the 25th inst. under the auspices of the Society, subject "The Forth Bridge."

CREWE AM: PHOT: SOC:—At a special meeting held on the 17th inst., it was resolved to remodel the Society; the rules were revised, and the society reorganised. It now promises, from the numbers who have joined, and are practically interested, to prove a valuable help and benefit to the amateur photographers in the town. The general meetings are to be held quarterly, the first Thursday evenings in the months of January, April, July, and October. The annual soirée to be held in January. Meetings in future to be held at the photographic studio of Mr. W. Booth, chemist, Chester Bridge.

CROYDON CAMERA CLUB.—The second ordinary meeting was held on the 24th inst. The amended rules were read and approved. Mr. P. Overton had joined the Council. The President then introduced the subjects which the members had met to consider, and defined the requirements which a good hand-camera should possess. He next explained the action and construction of the No. 2 Kodak. Mr. W. J. Bishop showed the working of hand-cameras by Fallowfields, Samuels, Turnbull, and Stirn. Mr. Alfred Underhill showed a large stand of lantern transparencies. Mr. Overton also exhibited a collection of sharp and brilliant slides. The next meeting is fixed for Wednesday, 9th April, when a demonstration of the various forms of platinotype printing will be given.

DEVON AND CORNWALL CAMERA CLUB.—A lantern evening was given on the 17th inst. Mr. S. Weekes passed through the Club lantern about 200 slides of his own making and from his own negatives, making appropriate remarks upon each. The lecturer led the company from Plymouth to the South of France, thence to Venice, Rome, the Italian lakes, Switzerland, and back to Devon and Cornwall, winding up with groups, both grave and gay, of persons associated with the Club either as members or friends.

EAST DULWICH AND PECKHAM PHOT: SOC:—The first meeting in April (falling on Good Friday) will be omitted. The annual meeting is postponed until Friday the 18th April.

HACKNEY PHOT: SOC:—The attendance of members on the 13th inst. was a very good one, the promised lecture of Mr. J. Traill Taylor proving an attraction. That gentleman gave an instructive discourse on "Optics as Applied to Photography," profusely illustrating his remarks with diagrams on the blackboard. A discussion followed, and a well responded to vote of thanks concluded the proceedings. Mr. Wall has promised to read a paper on "Chemistry," on May 22nd.

HOLBORN CAMERA CLUB.—The ordinary meeting on Feb. 21st was devoted to the instruction of beginners, when the first principles of bromide silver and platinotype printing, and of development, were expounded to an attentive audience by Messrs. Smith, Dear, Brocas, and Bayston. On Friday next, after the usual monthly lantern show, to which visitors will be welcome, the prizes won in the recent competition will be presented. Hon. Sec. E. C. Bayston.

KEIGHLEY AND DISTRICT PHOT: ASSOC:—An ordinary meeting of the Association was held at the Rooms, Mechanics' Institute, Keighley, on the 19th inst., Mr. Alex. Keighley (President) in the chair. There was a good attendance of members and friends, when Mr. G. W. Bater, one of the members, read a paper entitled, "A Tour in Germany." A splendid collection of slides, illustrative of the route, scenery on the Rhine, castle and other ruins, some of the chief buildings of the large towns, and a number of instantaneous views of the town and village life were exhibited by the lantern. The lecturer gave a very graphic description of the slides as they appeared on the screen, and the manners and customs of the inhabitants, also historically explaining many of the old ruined castles found in the valley of the Rhine and district, and some of the chief buildings in Frankfort and other large towns; in some instances explaining the exposure, development, and other matters pertaining to the negatives and slides. A very enjoyable evening was spent, concluding with the usual votes of thanks.

KENDAL LIT: AND SCIEN: INST.; PHOT: SECT.—The usual monthly meeting was held in the Museum Library on the 12th inst., Mr. F. W. Crewdson in the chair. Mr. Isaac Braithwaite gave an account of enlarging by both daylight and lamp-light, exhibiting a number of enlarged prints which elicited a good deal of favourable comment. Several other members gave their experience and showed examples, and considerable and very interesting discussion ensued. It was decided that the next meeting be devoted to a discussion on "Hand Cameras," and the Secretary was requested to arrange for the loan of several from manufacturers and others.

LIVERPOOL AM: PHOT: ASSOC:—On Wednesday evening, the 19th inst., the second of the series of practical demonstrations, mainly for the instruction of beginners, took place at the society's rooms, Crescent Chambers, 3, Lord Street, when, as arranged, Mr. J. L. Mackrell was the demonstrator. He in a practical and lucid manner interested and instructed his audience. The chair was occupied by Mr. Paul Lange, and although the meeting was not in any way of a formal nature his duties as Chairman were merely nominal, but his experience of the matters in hand, "Focussing and Exposing," was a feature. Several other of the older workers assisted in making the evening's instruction most enjoyable and profitable. We merely mention in passing the names of the Hon. Secretaries, T. S. Mayne and E. M. Tunstall, both workers of some considerable experience. The attendance showed a large increase and was numerous. The next demonstration will take place on Wednesday, 2nd of April, embracing the important phase of developing, when three different modes now in popular use will be treated in a practical way.

LIVERPOOL UNIVERSITY COLLEGE PHOT: SOC:—This Society held the last meeting of the present session on the 17th inst., Dr. Kohn, the President, in the chair. There was a good attendance. Dr. F. Hurter read a paper on "Recent Photophysical and Photochemical Investigations," giving the result of several years' work done by himself and Mr. Driffeld. After explaining how light was absorbed by passing through dark and coloured media and obtaining definitions of transparency, opacity, and density from the observed phenomena, Dr. Hurter went on to describe an instrument for measuring the density of negatives. He exhibited two forms of this instrument, the later form being much simpler in construction, and easier to manipulate than the earlier one. The instrument is essentially a Bunsen's photometer, graduated so

as to give at once the logarithm of the opacity, a quantity best suited for the plotting of the results on a curve. A slight discussion followed, and a hearty vote of thanks was accorded to Dr. Hurter for his valuable paper.

LONDON SOCIAL CAMERA CLUB.—On Wednesday the 13th inst., about sixty members and friends assembled at Carr's, in the Strand, the head-quarters of the club. About one hundred slides, by members, were first put through the lantern, after which a fine series by Mr. J. B. B. Wellington and Mr. E. R. Shipton (of the Camera Club) were thrown upon the screen, as also were some interesting views, taken in Norway, by Mr. R. E. Phillips, with which Mr. Herbert Smith, who worked the lantern, gave an amusing and original sketch of an imaginary expedition, supposed to be suggested by these slides, afterwards showing the now celebrated views lent by the Boston (U.S.A.) A. P. A. Most of the well-known "Socialists" were present, W. H. Cornell in the role of lecturer.

LONDON UNIVERSITY COLLEGE PHOT: SOC:—The usual meeting was held on the 11th inst., Dr. R. T. Plimpton in the chair. Dr. N. Collie, F.R.S.E., read a paper on "The Chemistry of Photographic Developers." The simplest form of development was first noticed, where a ferric salt has been reduced by light to a ferrous salt, when the nearly invisible image can be made visible by washing with ferriyanide of potassium or treating with a silver or gold salt, which metals are deposited where the iron has been reduced, thus developing the image. The development of the invisible image on the photographic plate was then noticed, and it was pointed out that in this case, as only an infinitesimal quantity of haloid salt of silver undergoes change during exposure to light, development has to be carried on in a different way from that already noticed. The alkaline developers—pyrogallie acid, hydroquinone, etc.—were next mentioned. These developers are characterised by their great affinity for oxygen, and differ from ferrous sulphate, the reaction of which with nitrate of silver was discussed, in being able to reduce the haloid salts of silver. The actual chemical change which takes place when a plate is developed by any of these substances was shown to be the same. The question why silver is deposited on one part of the film and not on another, thus forming the image, is explained by the assumption that electro-chemical decomposition occurs. It was, finally, pointed out that in all ordinary cases of development a reducing substance was necessary, and usually the greater the reducing power the more powerful the developer; and as there are numberless substances amongst organic compounds which possess this reducing power in a greater or less degree (phenyl hydrazine was shown as an example), the choice of new developers is, probably, by no means limited. In the discussion which ensued, Mr. E. S. Worrall criticised eikonogen as being admirably adapted for certain kinds of work, but, to get a good negative, he preferred the yellow image obtained by using the old-fashioned pyro developer.

NORTH LONDON PHOT: SOC:—The ordinary meeting was held on the 18th inst., Mr. J. Traill Taylor (President) in the chair. Mr. Howson, from the Britannia Works Company, attended to give a demonstration on "Printing on Alpha and Bromide Paper." A large number of specimen prints, both on Alpha and bromide papers, were exhibited in the room, and greatly admired by the members. The arrangement for making the exposures consisted of two argand burners supplied with gas through a Sugg's regulator, so that the number of feet burning per hour might be known. Behind this was placed one of Chappuis' circular reflectors fixed in a stand, and the light was thrown on the negative through a screen of oiled paper. The printing frame was placed upon a stand, which could be easily removed to any distance from the light, the distance being marked upon the base-board of the stand. A discussion followed. The Chairman then announced the meeting on April 1st would be a lantern night, at which Mr. Reader would take the chair, and on the 15th inst. he should be happy to give them a paper on "Stereoscopic Photography."

NORTH MIDDLESEX PHOT: CLUB.—There was a numerous gathering of members and friends at Beales' Restaurant, Holloway, on Saturday evening, the 15th inst., the occasion being the annual dinner. Several members of other London photographic societies were present. Mr. J. Humphries, F.S.A. (President) occupied the chair. The usual loyal toasts having been honoured, Mr. J. W. Marchant proposed the toast of the evening, "The North Middlesex Photographic Club and

its Officers," which was responded to by the Chairman, who briefly sketched the position of the Club, and alluded to the ability and energy displayed by the Council and the Hon. Secretary (Mr. G. R. Martin) in the past year, and to the successful manner in which the arrangements in connection with the recent exhibition of photographs and soirée had been carried out by them. The roll of membership had increased, as also had the finances of the Club; the lectures and demonstration had been well attended.

PHOT: SOC: OF IRELAND.—At the meeting on the 24th inst., Dr. J. Alfred Scott (Vice-President) in the chair, Mr. J. Joly, M.A., delivered a lecture entitled "Among the Alps with a Camera." The photographs were taken *en tour*, commencing at Brunen on Lake Lucerne, and terminating at Ursigue. The chief of them were exhibited either in reductions or contact slides, and comprised about seventy-two views. The exposures were varied from one-fifth second with small stop to whatever the light indicated for foreground. In this latter particular assistance had been found by resorting to the standard tables now published by various authors. The camera, $7\frac{1}{2}$ by 5, was supplied with a Dallmeyer R.R. landscape lens. Plates used were Wratten and Wainwright's. With regard to development, pyro was first tried but afterwards discarded, and hydroquinone entirely used. To get the best results, Mr. Joly developed by the "partial" method recommended by Dr. P. H. Emerson and Capt. Abney. The sky and bright lights, as from snow, were first brought up, and development of them stopped by plunging the plate in water. The development of the foreground is then proceeded with by dipping and brushing on a stronger developer, *i.e.*, a weak developer is used in the first part of the process. When detail is obtained the development is equalised by putting the plate back into the developer for a moment. Washing, fixing, etc., completes the process. The details were good, while the snow, glaciers, and skies were excellent. Instances of passing mists, or mountain tops peeping through clouds, showed that the lecturer and his fellow-traveller (Mr. Dixon) had displayed great taste in selecting their views, and great judgment as to exposure and development.

SHEFFIELD CAMERA CLUB.—A special meeting of the above Society was held on the 12th inst., to hear a lecture by Mr. H. W. Smith, the representative of the Eastman Company. The first part of the evening was taken up by the explanation of their enlarged "Kodak" camera, the roller slide, and new transparent films. Mr. Smith then proceeded with the main subject of his lecture, "Enlargements on Bromide Paper." After detailing in a clear manner the most suitable lights, developers, etc., he gave a practical demonstration on the Eastman paper by means of the oil lantern, explaining step by step the interesting process.

ST. BARTHOLOMEW'S HOSPITAL PHOT: SOC:—A meeting was held on the 12th inst., when the above Society, which is confined to amateurs, was formed, and the following officers were elected: Dr. W. J. Russell, F.R.S., President; Dr. V. D. Harris and Dr. H. Lewis Jones, Vice-Presidents; Dr. James Andrew, Hon. Treasurer; and Mr. W. B. Jones and Mr. W. J. Armitage, Hon. Secretaries. The chief object in the formation of the Society is the application of photography in the study of medical science. Thirty gentlemen have already joined.

WALLASEY PHOT: ASSOC:—The ordinary monthly meeting was held on the 5th inst., at the Association Room, Egremont Institute, Mr. E. Kite (Vice-President) in the chair. Mr. H. Wilkinson gave a most interesting paper on "Clouds and Cloud Negatives." He commenced by saying that a photograph showing a cloudless sky was now happily beginning to be a thing of the past. Some amateurs bought their cloud negatives, but unless they were prepared to lay in a stock their pictures became wearisome by reason of the same sky being repeated through all classes of subjects. Cloud pictures were by no means the least difficult branch of an amateur photographer's work, though it was a most interesting one. A suitable cloud would often change a somewhat indifferent subject into a really good picture. A cloud suitable for the general run of pictures, of which nine out of every ten were got in broad sunlight, was the cumulus, which consisted of broad masses of vapour. It was, however, a difficult effect to get, and he used a coloured screen and isochromatic plates, the contrast between the blues and white obtained thereby being most satisfactory. Mr. Wilkinson illustrated his lecture with a large number of negatives taken by himself. The evening closed with an exhibition of hand-cameras.

WOLVERHAMPTON AM: PHOT: SOC:—The second annual meeting took place on the 18th inst., Mr. T. Ironmonger, President, in the chair. The annual report, with statement of accounts, was presented by the Secretary (Mr. J. W. Evans), and showed that twelve meetings of the society had been held during the year, at which there had been an average attendance of twenty-five. Various papers had been read and demonstrations given. The membership of the society now numbers fifty-five, and there was a balance in hand of £5 14s. 5d. The first exhibition in connection with the society had been held in the course of the year, and the Committee congratulated the society upon the interest which had been taken in it, 21,400 persons having visited the Art Gallery during the time that the exhibition remained open. Mr. Perry said that thirteen new members had joined the society during the past twelve months. The following officers were also appointed:—Vice-Presidents, the Mayor, Mr. J. Forsyth, Lieut.-Colonel Thorneycroft, Mr. C. T. Mander, Mr. G. B. Thorneycroft, Mr. L. Morton, Major Hay, Captain Wight-Boycott, and Mr. Lyons Wright; Treasurer, Mr. Gibson; Secretary, Mr. Evans.

Exhibitions.

THE CRYSTAL PALACE EXHIBITION.

(Continued from page 201)

A VISIT of inspection to the exhibits of Messrs. Noakes, of Greenwich, will well repay those who are more particularly interested in matters pertaining to the optical lantern, for here on view are lanterns of every size and approved design, alike suited to the requirements of the lecturer, as well as the mere tyro. This firm is also the sole agent of the "Key" hand camera, which has already secured a place on that section of the apparatus department. They also show a large collection of English condensers, some of large dimensions and all at reasonable prices.

Messrs. Theobald and Co., of Kensington, have also a big show of lanterns, lantern slides, and enlarging cameras, one of the latter having gained the medal at last year's show. This firm appears to be fully alive to the value of judicious advertising, as well as the best medium of obtaining business publicity, for here may be seen a bevy of young damsels actively engaged in the preparation of coloured lithographic slides for lantern use. This being a speciality of the firm this constitutes a veritable "draw to their stand, visitors being attracted thereto, either by the charms of the young ladies themselves, or that of their handiwork, or possibly the happy combination.

The exhibit of Holmes, Sadler, and Holmes is confined exclusively to photographic furniture and accessories, and, therefore, stands in this respect unique.

Another stand, also unique in its way, is that of B. J. Edwards, of the Grove, Hackney. This exhibit is very neatly arranged, one side and the two ends of an oblong square being covered with large photographs from the best studios, including copies of the gold medal pictures just awarded to Lafayette, of Dublin, the other side being specially arranged for showing negatives and transparencies, the comparative results of ordinary and isochromatic plates, with which it is filled. Some of these are of striking value, as proving most conclusively the great power which, with judicious use, is placed in the hands of the intelligent worker. Special notice may be called to a vase of flowers, with a sliced lemon lying at its base. These when viewed by gas-light during the evening often form the subject of very interesting remarks.

The optical department has a worthy representative in the firm of Taylor, Taylor, and Hobson, of Leicester and London. Their show is not extensive, but the most noteworthy part of it is the photographs they exhibit as having been taken with their lenses. These are such as should satisfy the demands of the most exacting critic, being interiors of large dimensions, having absolutely straight marginal lines, and full of exquisite definition. These are severe tests, and consequently attract much attention.

Messrs. Shew and Co., of Newman Street, Oxford Street, are exhibitors principally of their now well-known "Eclipse" hand camera and shutter, and good examples of work done by them are also shown.

By no means the least interesting part of the exhibition is that of the periodical practical demonstration, given by the Platinotype Company, and tending still further to popularise this charming process, and it is highly gratifying to notice that year by year it continues to increase its hold upon the affections not

only of those interested in the practice of photography, but the public generally.

An interesting novelty in the way of hand-cameras is that invented and exhibited by Messrs. T. Riley and Son, which is got up to represent an ordinary Gladstone bag. The distinguishing feature of this camera is, that by one movement only the plate is changed, and the exposure made, the duration of time being entirely at the discretion of the operator, at the very instant of making the exposure. The camera itself consists of a rectangular box, which slides into the bag from the bottom, and is secured by means of straps; protruding from the camera is a small pin, sliding in a slot out in the bag, this pin being the sole medium by which it is worked. The plates are carried in sheaths in a vertical position, fixed to an endless band, rotating horizontally round two rollers. These are turned by means of a lever; a forward pressure causes this lever to turn the rollers just sufficient to bring the first plate into position, which is there held quite rigid, at the same time engaging itself with the shutter. Then, by removing the thumb from the pin, it is pulled back by a spring, causing the lever to open and shut the lens very rapidly. If a time exposure be required the pin is allowed to travel back until it reaches an indicating mark, and, being held there, long exposures can be obtained. The ease with which this camera can be worked, coupled with its moderate price, will doubtless command for it a ready sale.

The firm of Sands and Hunter make a capital show, as usual, of high-class cameras, fitted with their well-known instantaneous shutter, the capability of the latter being amply proved by a choice selection of instantaneous photographs, by the best-known workers in that branch. A most artistically-arranged table of artistic materials is that of Mr. Leek's, the well-known fine art publisher of Bedford Street, Strand. High-class portraits and groups of Royal and other distinguished personages arrest the attention to their stand of the passers by.

Messrs. Crouch and Co., of Barbican, London, exhibit a case of lenses and cameras, which, however, call for no special comments.

Messrs. Trevor and Co., of Plymouth, have introduced a speciality in postal wrappers for photographs, which are evidently having a good run. The idea is exceedingly simple and well worth the attention of those who are obliged to trust their work to the tender mercies of post-office officials.

Messrs. G. Houghton and Sons exhibit a large and varied assortment of photographic requisites, the principal speciality of the firm being their well-known portable dark-room fittings; an attractive feature of their stand, however, is the exhibition of specimens by Friese Green's patented process. The method of producing these is practically demonstrated from time to time, and the rough-and-ready way in which they are produced by a lad of whom it can hardly be said, "He is to the manner born," proves the almost absurd simplicity of the process.

The stand occupied by Messrs. Sharp and Hitchmough, of Liverpool, contains a well-assorted stock of requisites both for the professional and amateur photographer. A 15 by 12 enlarging camera, designed by Paul Lange, of Liverpool, is a very useful and well-made instrument, fulfilling all the requirements for which it is intended. They have also on view their "Aptus" hand-camera, and judging by the awards it has received, this has become a very popular instrument amongst that class of workers. A great variety of photographic sundries are also here to be met with and evidently much sought after.

The stand of Messrs. Pearson and Denham, of Leeds, although small, contains some genuine novelties in the shape of cameras, one being a reducing camera for making lantern slides from negatives of a larger size, which was recently noticed in the columns of the AMATEUR PHOTOGRAPHER.

Mr. A. Clarkson exhibits specialities for limelight worked with compressed gases. These are of a very interesting character, and will form the subject of a special notice in an early issue.

PEOPLE'S PALACE PHOT: CLUB.—During April the Club will meet as follows: Good Friday, all-day outing to Dorking. April 11th, apparatus night. April 25th, Mr. Charles W. Hastings on "Photographic Work."

ULSTER AM: PHOT: SOC:—The following are the judges for the forthcoming exhibition: Mr. W. Tomkinson, Vice-President, Liverpool Amateur Photographic Association; Mr. Hugh Reid, ex-President, Glasgow and West of Scotland Amateur Photographic Association; Mr. George Trowbridge, Head Master, Government School of Art, Belfast.

To Correspondents.

THE insertion of **QUERIES** and **ANSWERS** is attended with much labour, and it is requested that the questions asked and the answers given shall be short and to the point. No charge is made.

All communications for the columns are to be addressed to The Editor, "Amateur Photographer," 1, Creed Lane, Ludgate Hill, London, E.C.

RULES

1. Write clearly and distinctly on one side of the paper only.
2. Write each Query or answer on a separate sheet of paper.
3. Write the name and address legibly on the back of each communication, and sign all Queries and Answers with name or *nom de plume*.
4. All matters for these columns **MUST** be received by **TUESDAY MORNING'S POST**.
5. The Editors do not undertake to answer questions by post.
6. In answering Queries correspondents are requested to mention, in every instance, the number and full title of the query referred to.

QUERIES.

3619. **Exeter.**—Can any brother amateur kindly inform me of a dark-room I might use, either on payment or otherwise, in the above city? Also to whom to apply for permission to photograph the interior of the cathedral, and the exterior from the bishop's garden? I start on Saturday, 5th of April, so that an early answer will oblige.—A. F. L.

3620. **Ventilating.**—I have a wooden dark-room 6 ft. by 4 ft. Can anyone tell me how to make or buy a cheap ventilator?—SMOKE.

3621. **Lens.**—Will any amateur tell me if a quarter-plate $\frac{1}{4}$ in. focus lens will take half plate pictures, if used with a half-plate camera? and oblige.—SMOKE.

3622. **R.R. Lens.**—I have a Merveilleux camera, and not being satisfied with the lens, I should like to know if any of your readers could inform me if I can procure a cheap R.R. to fit the flange of the Merveilleux lens, or, if not, how can I fit a R.R. to the camera?—LIONEL THIRKELL.

3623. **Enlarging Lantern.**—Many thanks to those who kindly answered my query of March 14th. May I now put it again the reverse way? If I get a Pamphengos which will only take lantern slides, can I, by making lantern slides of the negatives I want to enlarge, get a good crisp picture, 12 by 10, or a little larger, suitable for forming an enlargement? I already have an arrangement for enlarging by daylight, but it is so uncertain, and such a bother to use, that I want to get a lantern.—R. A. R. BENNETT.

3624. **Yellow Stain with Hydroquinone.**—I am particularly attached to hydroquinone for developing bromide prints, but I find that there is apt to be a slight yellowness in the whites, especially after the developer has been made for some time. How can this be removed?—R. A. R. BENNETT.

3625. **Printing for Amateurs.**—Would some amateur kindly tell me the address of some dealer who prints and tones from amateur negatives at a cheap rate, as, although I see advertisements of dealers, I don't know whom to trust.—POOR CHINEE.

3626. **Quick Printing.**—I want some quick and permanent printing process, and which requires no lengthy toning or developing treatment, as with albumen or bromide paper. Would some amateur advise me, and say where it could be bought?—POOR CHINEE.

3627. **Collodio-Bromide.**—I am using the collodio-bromide emulsion for lantern slides, and the film always floats off in the developer. What is the reason, and how can I make it stick to the glass?—E. B.

3628. **Tone.**—What printing process and toning bath will produce pictures the same colour as "Harmony," in the last *Photographic Quarterly*?—NIGER.

3629. **Clark's Platinum Process.**—Will anyone who has had experience with Mr. Lyonel Clark's platinum toning process, let me know the difference in the cost of working, as compared with ordinary gold chloride toning?—NIGER.

3630. **Iron Precipitate.**—What is the cause of iron precipitating green crystals in developing dish half an hour after mixture with oxalate?—S.

3631. **Aperture of Lens.**—Will some amateur kindly tell me what would be the equivalent aperture, using a half-plate R.R. lens, working $f/8$, of $\frac{1}{4}$ in. focus, on a quarter-plate camera?—QUARTER PLATE.

3632. **Sunk Mounts for Enlargements.**—I want

to mount some enlargements; where can I buy the sunk mounts which I see enlargements are mounted upon. I think they look better than cut mounts. I want them to mount 15 by 12 enlargements. If any brother amateur will give price, I shall be much obliged?—J. J. B.

3633. **Shutter.**—Will any brother amateur help me with the following, and give me his experience. I want to buy a good all-round shutter, and as I can only afford to buy one, I want some advice which is the better—Kershaw's instantaneous, Thornton-Pickard's instantaneous, and time and instantaneous; or is there a better shutter in the market for all-round work? Should I like Thornton-Pickard's time and instantaneous if it is a good shutter.—J. J. B.

3634. **Camera for Victoria Lenses.**—Will any brother amateur tell me the following: I have bought four Victoria lenses on a flange, and am about to make a camera for them; will he be kind enough to inform me how to construct one to take either Victorias or Gems, as I understand they will take either?—S. H. EARNEST.

3635. **Toning.**—Will someone kindly inform me, whether, in using double process of toning with hypo and acetate lead, a fresh hypo bath should be made every time?—F. NOVICE.

3636. **Stanley's Magnesium Enlarging Lamp.**—Will any of your readers give me their opinion of the above from practical experience?—J. F. F.

3637. **Discoloured Prints.**—If anyone has tried the following remedy for old and discoloured sensitised albumenised paper, would he kindly tell me if he has found it succeed, as I have not? One part liquor ammonia to fifty parts water. The prints to be immersed in this bath before and after toning, and also some ammonia to be put in hypo bath.—ALBUMEN.

3638. **Transparent Films.**—Will someone kindly tell me if there are any spools of transparent films in the market which do not require stripping, and which are cheaper in price than celluloid?—E. H. G.

3639. **Focussing.**—Will any reader inform me of a simple arrangement for focussing a hand-camera for the following distances: 5, 10, 20, and 30 feet, using non-achromatic lens, quarter-plate?—DETECTIVE.

3640. **Changing Arrangement.**—Will anyone tell me how to make a simple changing arrangement for quarter hand-camera, no sheaths to be used?—DETECTIVE.

3641. **Non-Achromatic Lens.**—Where can I obtain a cheap non-achromatic lens, suitable for a quarter-plate home-made hand-camera?—DETECTIVE.

3642. **Paper Negatives.**—Can I use Morgan and Kidd's Eastmans, or Ilford ordinary enlarging paper for negative purpose, and what is about the right exposure to give with Lancaster's instantaneous lens? Will I have to use a clearing bath, and will the usual fixing bath do? What developer will I have to use? Will I have to make the negatives transparent to print from? If I have, the best way will oblige.—MAC.

3643. **Bruno's Model Camera.**—If any of your readers have used Bruno's combination camera, "The Model," would they kindly give their experience? I want a hand-camera that will work plates or films.—HUMBLE B.

3644. **Torquay.**—I shall be visiting early next month, and shall be glad to hear if anybody will allow me the use of dark-room for changing plates, etc.; also if plates and necessary chemicals can be procured there.—B. B.

3645. **Spring Carrier.**—Is there a cheap spring carrier made suitable for carrying a small camera on a tricycle or on a safety? The Quadrant Company advertise one, but it is far too dear.—S. H. A.

3646. **Lens.**—What description of lens is best suited for a hand-camera such as Shew's?—S. H. A.

3647. **Toning.**—Will some reader give me a good formula for turning out prints a velvet brown?—W. H. ARMITAGE.

3648. **Oil Paintings.**—Please let me know how the yellow screen is to be used with isochromatic or orthochromatic plates. Also which is the best of these plates, and what developer is most advisable?—W.

3649. **Loan of Double Backs.**—Will some amateur kindly tell me where I can get the loan of two or three double-backs for a "La Meritoire" camera, quarter-plate, for one week. I think the same backs are used for Lancaster's Le Merveilleux, La Meritoire, and Instantograph. I will pay postage and a fee for the loan, and will deposit at the AMATEUR PHOTOGRAPHER office if required.—PERRIE (address with Editors).

3650. **Taylor and Hobson's Lenses.**—Can any of your readers inform me whether I can do better than purchase a set of Taylor and Hobson's R.R., W.A.K., and K.V. casket lenses for general work, and also if there is any disadvantage in using them on a Raymont camera?—PARKMOUNT.

3651. **Eikonogen.**—I fail to get density with this developer, using formula No. 1 by Dr. Andreen, accompanying eikonogen. Can any of your readers give the reason why, and indicate what article in the various formulas published increases density, and what retards it?—IONA.

3652. **Alum.**—Are alum and chrome alum used for the same purpose, viz., hardening the film? If not, I presume when alum is named in any formula

chrome alum should not be used, and *vice versa*.—IONA.

3653. **Tour in Yorkshire.**—As I purpose spending my holidays in Yorkshire some time during the coming summer, and making Masham my headquarters, I should be glad to learn if there are any amateur photographers in the town who are readers of your valuable magazine, and who would be willing to allow a brother amateur the use of his dark-room for the development of plates?—IONA.

3654. **Lens.**—I should like to know if any of your readers could give me an idea of the working value of a lens I have, a rapid doubler by Lightner and Co., Sydney, New South Wales?—W. POLLOCK.

3655. **Tour in Warwickshire.**—Intending to visit Warwick and neighbourhood at Easter, I shall be glad to know where to apply for permission to photograph in the following places: Warwick Castle, Kenilworth Castle, Guy's Cliffe, Holy Trinity Church, and if plates can be bought at Warwick?—J. M.

3657. **Oil Light for Lantern.**—Will someone inform me the way to get the best light in an ordinary oil lantern, i.e., the best way to get the most light?—RALPH DIXON.

3658. **Magnesium Light.**—Wanted at once, information about photographing groups at private theatrics by flash-light.—H. A.

3659. **Detective Camera.**—I wish to convert my quarter-plate camera into a detective or hand camera, to hold, say, twelve plates, without the trouble of dark-slides. Will any reader of an ingenious, mechanical turn of mind kindly help me with a few ideas or a drawing? Are there any cheap magazine backs for twelve plates that could easily be attached to an ordinary camera?—ONYX.

3660. **Hand-Camera, Lens, and Tripod.**—Can any of your readers give me advice as to the choice of a quarter-plate hand-camera, suitable for use with a roll-holder, and that can be fitted to a tripod for time exposures? Is any lens more suitable for such a camera than a R.R. of about 5 ins. focus? Whose lenses are the best for such work? Can anyone recommend from actual experience the Model camera, which was described in the AMATEUR PHOTOGRAPHER some weeks ago? Can anyone recommend a very light tripod for occasional use with hand-camera?—G. W. B.

QUERIES UNANSWERED.

Feb. 21st.—Nos. 3471, 3476, 3478, 4391, 3493, 3404.

28th.—No. 3517.

Mar. 7th.—Nos. 3528, 3530, 3531, 3512, 3551, 3554, 3556.

14th.—Nos. 3561, 3566.

21st.—Nos. 3585, 3587, 3593, 3595, 3593, 3601, 3603, 3610, 3612, 3613, 3614.

ANSWERS.

3575. **Hiring Apparatus.**—Messrs. Sands and Hunter are the only firm I know of who advertise cameras on hire. Their terms are—for goods of value £3-3s. per week, and if the apparatus is purchased within a month, the hire is deducted from price. I quote from their catalogue.—R. W. B.

3574. **Ilford Plates in Paris** can be had from Moleur, 44, Rue du Chateau d'Eau.—J. H.

3577. **Insoluble Gelatine.**
G-latine... .. 1 drm.
Water... .. 4 drms.
Powdered bichromate potash... .. 10 grs.

Soak gelatine in water for a short time, and then dissolve by the aid of heat, lastly adding potash in small quantities at a time.—SUNLIGHT.

3578. **Holiday in South Devon.**—Some few years ago I spent a holiday in South Devon. I made Paignton my headquarters. I cannot speak about the hotels, but lodgings are cheap and good. It is two miles from Torquay, and the following places are easily accessible:—Dartmouth, Totnes, Ashburton, Buckfastleigh, Newton Abbott, Teignmouth, Dawlish, and many others.—G. H.

3578. **Holiday in South Devon.**—If "Hobby" will communicate with me or call upon me, I shall be pleased to give him my experiences of Sidmouth and neighbourhood.—J. W. M. (address with Editor).

3578. **Holiday in South Devon.**—You will find Lynmouth or Lynton a good headquarters, as many lovely excursions can be made from either place; the celebrated Waters Meet is one of the most beautiful spots in South Devon. Ilfracombe, Morthoe, Clovelly, Bideford, and other equally pretty villages are to be found within easy distances. If you stop at Barnstaple you will find the "Fortescue" a very comfortable hotel.—W. A. J. CROKE.

3579. **Removing Stains from Steel Engravings.**—I should advise your taking the prints to a proper man, who will tell you if they can be cleaned without damage.—W. A. J. CROKE.

3580. **Italy.**—The querist might take eikonogen and potassium sulphate in the dry state, and make up his developer *en route*. This is more convenient than taking bottles of liquid, and is capable of the best results. I have found Wratten's plates stand the variations of temperature and quality of water better than any others I have tried, and they are perfect in results with above developer. Instantaneous answers all purposes, but if querist prefers a slow plate for landscape, he can take some of their

ordinary. Both are unsurpassed in quality.—R. W. B.

3580. Italy.—Any concentrated developer. Have you tried Oldham's powder developer? Take the plates you are most accustomed to using. Why not wait until you return before developing them?—W. A. J. CROKE.

3580. Italy.—You could not do better than to use Ilford ordinary plates and the developer the manufacturers recommend. It would be much better if you left your developing until you returned; it is impossible to develop plates properly *en route*.—SUNLIGHT.

3581. Metal Slides.—Tylar's are very good for those who like metal slides and cheap ones, but the great objection to them is their great weight. They can certainly be bought separately, but I fancy you get them cheaper by buying three or so at a time.—W. A. J. CROKE.

3581. Metal Slides.—I use Tylar's slides, and think them first-class. You can only procure them in a set of three as half-plate, price 12s. 6d.—W. H. ARMITAGE.

3581. Metal Slides.—I have used Tylar's metal slides for the last two years, and find them perfectly satisfactory; they are perfectly light-tight, and will not warp. The only disadvantage I can find is that they are rather heavy, but this again is counterbalanced by the fact that six of them take up only as much room as three wooden slides. I don't know whether you can buy them separately, but I dare say Mr. Tylar would oblige you, as he is "the amateur's friend."—HUGH FINN.

3582. Metal Dark-Slides.—I have used them for some months, and can thoroughly recommend them. I will mention one instance to prove their utility. I had charged the slide with two of Thomas's E.R. plates, and by accident I left them in direct sunlight for an hour. When developed, however, they showed not the slightest sign of fog. The only disadvantage they possess is, I think, that they are slightly heavier than wood slides; but that is of very little consequence when we consider the many points in favour of them.—ARGENTI NITRAS.

3582. Metal Dark-Slides.—Lancaster supplies free an adapter for using his metal slides with the Instantograph. They are heavy, and I think Talbot and Bamer's better.—H. F. C.

3582. Metal Dark-Slides.—I presume you mean Tylar's metal slides; if so, I believe Tylar makes special frames to fit Lancaster's cameras. Why not write to Mr. Tylar? He would be only too glad to inform you.—HUGH FINN.

3583. Magnesium Flash-Light.—The smoke is magnesia, and must inevitably be produced by the combustion of magnesium. From my own observation, the combustion in a pneumatic lamp is less perfect than in a spring one, I imagine from the powder in the tube-lamp being driven with greater force, as well as accompanied by cold air. A comparison between a home-made "pistol" lamp, arranged to throw the magnesium in a well-spread condition, with little force, into a large spirit-flame, and a pneumatic lamp with ebullient tube, gave results showing the former to be superior, as there was less unconsumed metal thrown on to a paper placed in front, below the lamp, and the flash was of much greater brilliancy and an important matter—less duration. The smoke of the former was finer, and disappeared sooner.—R. W. B.

3584. Ilford Formula.—Dissolve 4 ozs. pure sodium sulphite in 6 ozs. water (warm), add 20 grs. citric acid, and pour over 1 oz. of pyrogallol acid, make up to 10 ozs. with water; label, pyro 10 per cent. Ammonium bromide 1 oz., water to 10 ozs.; label, ammonium bromide 10 per cent. Liquor ammonia ('880) 1 oz., water to 10 ozs.; label, ammonia 10 per cent. For use: pyro, 1 drim.; bromide, 30 minims. Commence with ammonia, 15 minims; and gradually add more as required. The above is the best developer I know of.—ARGENTI NITRAS.

3584. Ilford Formula in 10 per cent. solutions. I copy from *Photographic Scraps* for last October:—

Pyro	...	...	...	1 oz.
Water	...	...	...	to 10 ozs.
Add 20 drops nitric acid.				

Brom. amm.	...	...	...	1 oz.
Water	...	...	...	to 10 ozs.

Ammonia '880	...	...	...	1 oz.
Water	...	...	...	to 10 ozs.

To develop half-plate, take P, 37 minims; B, 50 minims; A, 90 minims, and add water to make 2 ozs.—J. H.

3586. Wide-Angle Lens.—I have had the use of a W.A. lens by Wray, and consider it a splendid instrument, and would certainly advise "J. J. B." to purchase one.—P. K.

3586. Wide-Angle Lens.—There is not much to choose between an Optimus or Wray's lens; they are both thoroughly reliable articles, and well worth the money. As you have an Optimus, why not stick to the make, and get a W.A. lens of the same make?—HUGH FINN.

3588. Aristotype.—Mr. Hethon Lewis, in *AMATEUR PHOTOGRAPHER*, January 24th, 1890, page 54, gives complete directions for this.—F. DAVIS.

3588. Aristotype.—Prints on this paper can be

mounted with Thomas' india-rubbersolution without losing any of the gloss.—SUNLIGHT.

3588. Aristotype.—I have succeeded in mounting prints without losing gloss by using Hinton's "Aristo Paste." Another method is to paste thin card to print, when in contact with glass, and before it is quite dry. After stripping, the print may be mounted in the usual way.—W. A. S.

3589. Gaslight.—Interiors can be taken by gaslight, and copying can also be done—see an article in the "British Journal Almanac," 1890. But portraits are out of the question, the exposure being necessarily very prolonged. Magnesium wire burnt gives a manageable exposure.—C. J. E.

3589. Gaslight.—Yes, with a few hours' exposure.—P. K.

3589. Gaslight.—Photographs can be taken in gaslight on ordinary plates, with from three to five minutes' exposure, but if isochromatic plates are used, one-eighth of this exposure will do.—SUNLIGHT.

3590. Sensitised Paper.—The sensitised paper may become yellow in the toning bath, if it has come in contact with ammonia. If you mean that the paper turns yellow after the prints are finished, then the cause is insufficient fixing and washing.—HAMISH.

3590. Sensitised Paper.—This is a result of too great a quantity of gold in your toning bath.—W. A. J. CROKE.

3590. Sensitised Paper.—I can hardly understand your query. I presume that you mean that the prints turn yellow when put into the fixing bath; if so, it is a sign that the fixing bath is acid, and sulphur toning ensues. You must make the bath alkaline, and be careful not to over-tons.—SUNLIGHT.

3591. Chloride of Gold.—Unless you are a professional in a large way of business, it would be absurd to attempt such a thing. However, I will describe the process. Add solution of ferrous-sulphate, and a black precipitate results. This may be dissolved in aqua regia, and the gold in resulting solution reprecipitated by ferrous-sulphate, when it may be re-dissolved in aqua regia to form the chloride.—SUNLIGHT.

3591. Chloride of Gold.—You can recover gold from old toning baths by precipitating it with a solution of ferrous sulphate.—HAMISH.

3591. Chloride of Gold.—This can be done, but is generally not worth while, unless you have very large quantities of old solutions.—W. A. J. CROKE.

3592. St. Heliers, Jersey.—Mr. De Faye, Photographic Chemist, David Place, St. Heliers, gives gratis the use of his dark-room. He supplies all makes of plates, and necessary chemicals.—J. LAURENS.

3594. Dark-Room.—Buy "Burton's Handbook of Modern Photography," cost 1s.; pages 19 to 23 will help you. My own dark-room cost me only £1, it will hold two very comfortably.—ORGANIST.

3594. Dark-Room.—No. 50 of the penny weekly, *Work*, dated 1st inst., will give you some useful information for fitting up dark-room.—SUNLIGHT.

3597. Hand-Camera.—Eastman's Kodak, to be obtained from the Eastman Company, 115, Oxford Street, W.—W. A. J. CROKE.

3597. Hand-Camera.—If "Mervi" prefers a roll-holder for films separate from the camera entirely, Shew's eclipse hand-camera would probably suit. If, on the other hand, a very compact apparatus is preferred, combining the roll-holder and camera, Robinson's (Regent Street) "Luzo" would probably suit well.—O. WOLLASTON.

3597. Hand Camera.—The Kodak, manufactured by the Eastman Company, Oxford Street, W.—SUNLIGHT.

3598. Photography in Germany.—No difficulty in getting plates, etc., for tourists' own use in this country. Pictures can be taken freely, except in neighbourhood of fortifications. Ilford plates can be had from S. Federlein, Louise Strasse No. 2, Hanover, and his sub-agents.—J. H.

3599. Book on Lenses.—The only book treating exclusively on lenses that I know of is one by Dallmeyer, and is titled "Dallmeyer on the Choice and Use of Photographic Lenses." The price is 1s.—HAMISH.

3599. Book on Lenses.—Write to Taylor, Taylor, and Hobson for their list, and you will get the particulars you require. Their lenses are good.—H. F. C.

3599. Book on Lenses.—Book by Dallmeyer "On the Choice and Use of Photographic Lenses," price 1s.; also Burton's "Book on Photography," pages 34 to 42.—ORGANIST.

3600. Lantern Slides.—Ordinary dry plates are not suitable for your special purpose, but you will find the "Mawson Photo-Mechanical Plate" all that you require. If you follow their directions as to developer, etc., you will not go wrong. As to lantern plates, for cold grey tones use Mawson and Swan's, or Fry's; for warm ones, the Alpha plates. The hydroquinone developer I find best for the lantern plates. There will be no difficulty about contrast. Shall be pleased to write further if you like.—C. J. E.

3602. Potassium Chloro-Platinite.—If you wish to prepare this, I would advise you to purchase Mr. Lyonel Clark's book on "Platinum Toning," on page 87 of which he gives the mode of preparation. This book can be had of the Publishers of the *AMATEUR PHOTOGRAPHER*.—HAMISH.

3603. Shutter.—Veyers, of Leeds, supplies a drop shutter which, I think, would suit you.—P. K.

3603. Shutter.—If you don't care about time exposures, get a Kershaw. If you want time exposures as well as instantaneous, get a Thornton-Pickard. Both work admirably, and are cheap.—R. A. R. BENNETT.

3603. Shutter.—For a between-lens shutter (undoubtedly the best form) Newman's is admirable, and my 7½ by 5 one works up to the advertised 1/100, as proved by experiment. It is at its best when used with an Iris diaphragm. For a shutter on hood of lens, the Kershaw or Thornton-Pickard would suit "Finisterre." The latter has, like the Newman, the advantage of a time arrangement.—R. W. B.

3603. Shutter.—If "Finisterre" will please communicate with me, I will be pleased to recommend to him (and furnish him with full particulars) a good shutter for general work, at a very moderate price.—HAMISH (address with Editor).

3603. Shutter.—Newman's, if you can afford it; if not, the Norden flap shutter, made by Tylar.—SUNLIGHT.

3605. Light Camera.—Lancaster's 1890 Special patent camera would answer your purpose.—SUNLIGHT.

3605. Light Camera.—If you care to write me, I will help you if I can (address with Editor).—W. A. J. CROKE.

3606. Intensifier.—The reason is that you have not washed them thoroughly, and there is some trace of hypo remaining.—ARGENTI NITRAS.

3607. Blacking for Stops.—Mix 2 drms. pure nitric acid with equal quantity of water, and put a piece of clean copper into it till it gives off no bubbles. Clean the stop, and heat it well in a spirit lamp. Plunge it into the solution, then heat it in the lamp till it turns black.—H. F. C.

3607. Blacking for Stops.—Heat the stops slightly over the fire, then dip them into pure commercial nitric acid quickly, then again heat over the fire till they have become black; after this rub them with a brush, and polish them with a piece of greasy wash-leather. You must not let them touch the coals whilst heating.—R. E. S.

3607. Blacking for Stops.—Make stops fairly hot, and dip them into a solution of copper nitrate, and then heat them over a Bunsen burner or spirit lamp until they assume a black colour.—SUNLIGHT.

3607. Blacking for Stops.—Make strong solution silver nitrate, also strong solution nitrate of copper; mix both solutions, and dip stops into same for a few seconds. Take them out, and heat until the dead black is obtained.—ORGANIST.

3607. Blacking for Stops.—I have found the best results to be obtained by a bath of nitric acid 4 drms., water 2 ozs., with a few strips of copper, about ½ oz. or less, dissolved in it before use. There should be some free acid. The brass stops should be well cleaned, and dipped in weak acid, about 1 to 30, to remove all grease, then dipped into the nitrate of copper bath, and warmed gently on removal (avoiding making the film of liquid on the brass ball) till dry, then heated red-hot or nearly so. They are finished by brushing with dry blacklead. Some samples of sheet-brass turn spotty, but the only remedy is to try another piece that doesn't, as far as I know. The results are not equal to, say, a Ross lens in finish, but there is said to be a trade secret about the method employed by the best opticians, and the above recipe is the best I have tried, as well as the simplest.—R. B. W.

3609. Halation.—You must back the plates with burnt sienna and gum, mixed thick, with a few drops of glycerine added. Wash it well off before developing. Or you can use films, but it is rather doubtful if they really do prevent the evil. Or you can block out the window with sacking, which, however, would be rather a job, and not look particularly ornamental.—R. A. R. BENNETT.

3609. Halation.—Use Edwards' isochromatic plates, and paste (or glycerine) on to back of same, in optical contact, a piece of black or brown paper—to be removed when developed—you will then have no halation whatever.—F. DAVIS.

3609. Halation.—Back your plates in the ordinary way with sepia or any other formula.—W. A. J. CROKE.

3611. Toning Silver Prints.—If the prints are mealy, the fault is in the sensitising. As mealliness shows itself after printing, it is only waste of time to tone the prints, as the results are not pleasing. If "A Crowe Quill" will forward me a print, I will endeavour to assist him. Use powdered soda in first washing, instead of crystals.—HAMISH (address with Editor).

3611. Toning Silver Prints.—Why not try the borax formula? It is much simpler than the acetate, and gives better results. You will find the following a simple and effective stock solution:—Borax 1 oz., dissolved in 10 ozs. of hot water; make up to 2 qts. with cold; take 8 ozs. of this solution to 1 grm. of gold, which will be sufficient to tone one sheet of paper. This solution should be used just warm.—W. A. J. CROKE.

3615. Bromide Paper.—"X. Y. Z." cannot do better than read Mr. H. H. Roden's article on page 416 of "The British Journal of Photography Almanac," 1890, as a remedy for yellow stains caused by hydroquinone development.—W. E. REYNOLDS.

3616. Micro-photography.—There is no rule to

give "Luder" on the chemical and visual foci of microscopical lenses, as it must be found out by experiment. Objectives made by Swift are, however, corrected for photography, and I believe he is willing to add a correcting lens for the purpose to any objective for 10s. His address is Tottenham Court Road, London. High powers are not supposed generally to want correction; if low powers give an indistinct image, "Luder" might try the experiment of reducing the focus by one-thirtieth, as is often used in uncorrected lenses. There is a good deal about photo-micrography in Davis's "Practical Microscopy," and there is also a book on the subject by Jennings, I think. I have not my books here, but these could be got through a scientific bookseller.—J. G. P. VEREKER.

3618. Amateur Starting.—I should advise you not to get whole-plate, but half-plate camera. Underwood (Exhibition) 1889 is a splendid instrument. Also I should get an Optimus Euryscope lens. Send for catalogue (four stamps) to Underwood, Brunswick Works, 130-132, Granville Street, Birmingham. The lens you will get at Perken, Son, and Rayment, a very fine lens.—ORGANIST.

3618. Amateur Starting.—It is usual for an amateur when commencing photography to use either a quarter or half plate camera, but if the cost is of no consequence I should certainly advise "Chemist" to purchase a whole-plate camera. I use a half-plate camera, which is of splendid workmanship and makes many a brother amateur envious. If "Chemist" will write to me, I will be pleased to tell him where to get a first-rate camera, etc., and all particulars.—HAMISH (address with Editor).

3618. Amateur Starting.—I should certainly advise "Chemist" to get a good long-focus whole-plate camera at starting. The camera ought to have rising front, reversing back, and swing-back, also some arrangement for side swing, and had better be arranged for advancing the back for short focus lenses. Ross's cameras, Beck's Peccops, the Optimus wide-angle, and many others are of the type I mean; and see that it is made for hard wear, and of close-grained, well-seasoned mahogany. A cross motion to front is sometimes useful, but not often used. A camera of this sort can be used with any focus lens from quarter-plate upwards, to a certain limit, about 22 ins. focus. Inner frames for carrying smaller plates can easily be adapted. He ought to get for his purpose an Euryscope form of lens, working about f/5; this will probably be fast enough for the portraits he may require. Large portrait lenses are rather heavy for the light fronts these long-focus portable cameras require; unless he requires a camera for portrait work chiefly, in which case a camera focussing by the back will probably suit him better. The lenses ought to be got from a recognised maker. The whole-plate lens will not put on the quarter or half plate as much as on a whole-plate, but I presume he wants the quarter-plate for experiments, and the lens will answer for portraits on the half-plate. If this does not quite suit "Chemist's" requirements, it is easy to use a half or quarter plate lens with the camera I have mentioned. For prices of cameras and lenses I refer him to the dealers' catalogues, or one of the photographic almanac's advertisements.—J. G. P. VEREKER.

3618. Amateur Starting.—I would advise "Chemist" to purchase Lancaster's Instantograph (half-plate) minus the lens. The latter should be purchased from a first-class maker, such as Wray. I should also advise him to use the ammonia-pyro developer and borax toning bath.—P. K.

3618. Amateur Starting.—I should not advise you to buy a large and expensive camera to start with. A cheap second-hand half-plate camera would answer much better, but by all means get a good lens of the rapid rectilinear pattern. There is no best makes of cameras and lenses; all the leading manufacturers try their best to turn out good apparatus, and I think they succeed very well.—SUNLIGHT.

3618. Amateur Starting.—I should certainly advise you to buy a half-plate camera, and have carriers for quarter-plate; this will save expense, as you will waste a number of plates at starting. Any good maker will supply you with a reliable camera, e.g., Watson and Sons, High Holborn; Atkinson, Liverpool, etc. See that the camera has a swing-back and, for convenience sake, a reversing back. Some advocate a rising and falling front, but personally I have not found much use in it. Get an R.R. lens; it will do all you wish. Get, if possible, an Iris diaphragm, as it is handier than the loose stops. For seascapes you will want a shutter; there are great numbers of them in the market, but I should advise the Thornton-Pickard. As you are a beginner, do not be too ambitious at first. Get advice from some friend who knows. Use your brains, and read intelligently.—HUGH FINN.

EDITORIAL.

NOTE.—Anyone requiring an opinion upon photographic apparatus, plates, etc., must give a number or initial for identification, as in no case will makers' names be inserted in this column.

SPECIAL NOTICE.—We are very pleased to find that replies in this column are so much appreciated, but we should be very grateful if those requiring advice would send their letters to us BEFORE TUES-

DAY MORNING's post if possible. The time occupied in replying in this column is very considerable, and owing to the often late receipt of letters, many matters have to be left over each week. This we much regret.—ED : AM : PHOT :

A. T. LEMARCHAND.—Write to the Rev. J. Sparshott, Hon. Secretary of the newly-formed Photographic Society of Exeter.

G. K.—Undoubtedly the principle is patented, and you cannot, therefore, make one for your own use. The lantern slides are still at the Crystal Palace, and we shall not probably have them back till Monday.

J. R. MARTIN.—We cannot advise you, but in a week or so we shall report upon several hand-cameras. You mention two, and we have no hesitation in saying the first is by far the best. Read our rule at the head of this column; it is one we rigidly adhere to.

R. W. BUTTERMER.—Name the books, and our publishers will write you as to price. Do you wish us to mark a list? We shall endeavour to give even better results in future "extras." We should advise B; it is exceedingly portable, and well made. We never had much opinion of D; the plate was far too small. The lenses you mention are very good. Not much practised; should think they would be too slow, but do not like to venture an opinion without trying them.

W. A. SOUTHALL.—Your suggestion shall be kept in view. We are much obliged to you for it and your very kind remarks.

J. H. T. G.—Very pleased if you will call; we can then perhaps find you something for your boys' club. You cannot do better than Z.

BOYD MOSS.—We will send your letter, but first will make inquiry about the book.

J. W. HORTON.—The entry form, etc., shall be sent on. Obtain "Photo-Micrography," by A. Cowley Malley (Lewis). Will make inquiry about the City and Guilds of London.

J. BELLITT, JUN.—The titles are so in error; it should be, study H. P. Robinson's books, and master lighting and exposure. A list which includes Mr. Robinson's books can be had of our publishers. We always endeavour to be fair, just, and honest to everyone.

FLEX.—We are very sorry that the advertisement was inserted. It shall not occur again. It is almost impossible to be up to the man.

H. J. CUNNINGTON.—Should advise B.

MRS. IBBETSON.—We shall be very pleased for your daughters to compete as you suggest.

W. H. SHIRLEY.—In the words of a well-known actor, "The time will come."

JAMES FINDLAY.—You can put up No. 1 on a tripod, it is far more handy than No. 2. The cameras by the other firm are not such as to induce us to recommend you to wait for them. No. 1 beyond 10 ft. Edinburgh, don't know. Really we cannot spare time to write you, and it is against our rule.

R. A. E. BENNETT.—We believe the Exhibition closes on Saturday. Not more than they deserved, many of them.

INEXPERIENCE.—Not worth twopenny. You cannot get a hand-camera to be of any service under £3 3s. to £26 6s.

REV. A. JOHNSON.—Certainly should advise first either III, or IV., the latter perhaps, and afterwards V., which is handy and unobtrusive.

MR. JONES.—Write to the Rev. F. C. Lambert, Cambridge. Look up the AMATEUR PHOTOGRAPHER for June 1st, 8th, 15th, 1888, answer 692.

CORRIN.—No. 1 is a very compact little hand-camera, and better suited than No. 2, which is a very excellent instrument. These are the two best, and are both thoroughly well made. We believe No. 4 is a good apparatus, but have not had an opportunity of thoroughly examining it.

J. S. H.—Only a toy, and useless for any purpose.

PENDENNIS.—(1 and 2) A cheap quarter-plate set. (3) A is a very fair camera; have never seen B. (4) Certainly. A to commence with. (5) Start with and stick to B. (6) They are recommended by the maker. (7) We prefer wood. (8) Never heard of slides with that name made by the firm you mention.

LEGIS.—No. 1 is a well-made instrument, No. 2 we do not care for. No. 3 is an excellent hand-camera, and would probably best suit your requirements. No. 4 is well made and very compact, but dark slides are required. No. 5 is not in the market. No. 6 is a very handy and compact detective camera, quite reliable. No. 7 has many good points, but we have only had an opportunity of examining the first that was made. You can safely buy the lens you mention.

A. W. GOTTLEB.—We retained the services of a gentleman in every way qualified to criticise the exhibits at the Crystal Palace, and we are quite certain that he would not have called your picture "inartistic" had it not fully merited that censure, and although it may be a fact that "foxes are shot by keepers every week, at some seasons of the year, and the keepers rewarded for so doing," such fact does not render their action less "of an unsportsmanlike act."

YARMITE.—No. 1: We like glass, but excellent negatives have been taken on "strippers," and we have seen some very creditable ones on the new rollable film. No. 2 camera is very serviceable and handy.

THOS. HOLMES.—Have never before heard of the

camera; but will send to the agent, and report next week.

H. STAVELEY.—Perhaps you would call and show us the tent. Tuesday or Thursday.

W. MCPHAIL.—Your letter is published, also one from Mr. J. Crighton upon the subject.

BOYD MOSS.—Thank you very much; we have sent on your letter to the Rev. E. Pope.

DIAPHRAGM.—(1) A first-class lens should cover the plate, and give good definition all over. (2) Work at f/6 or f/8.

A. BROAD.—All photographs for the "Monthly Competitions" have to be sent in, on, or by, the 14th of each month. One print only.

TURNBULL.—If you send us your camera, we shall be pleased to notice it. All apparatus sent us is returned in fourteen days.

E. R. HOWARD.—For "Photographic Haunts in and Around London," see back numbers of the AMATEUR PHOTOGRAPHER.

SUMMERVILLE.—Write the Rev. F. C. Lambert, Cambridge, he is enthusiastic about such work; or Mr. R. A. E. Bennett, Union, Oxford.

OPTIMUS.—See Wall's "Dictionary of Photography," page 47. Divide the focal length of the lens by the diameter of the diaphragm.

FINDUS.—You will find D, A, and C, good lenses, we place them in their order.

W. ARMITAGE.—Use the R.R. lens without removing back or front.

TEGES.—Daguerreotype, we know of no means. Photography is permitted in the parks, but only by amateurs; and the officials, we presume, decide whether the operator is causing an obstruction. Thank you for your good opinion, we will do our best to continue to deserve it.
